ANNUAL REPORT

OF THE

COMMISSIONER OF PATENTS

FOR

THE YEAR 1865.

VOLUME I.

WASHINGTON:
GOVERNMENT PRINTING OFFICE.
1867.

INDEX

TO THE

DESCRIPTIONS AND ILLUSTRATIONS.

Invention or Discovery.	Name of Patentee.	No.
A.		
Acids, pyroligneous.....	A. H. Emery.....	49, 247
Adding machine.....	T. T. Strode.....	49, 168
Addressing machine.....	N. E. and G. W. Warren.....	47, 142
Adhesive fastening for papers.....	G. R. Burdon.....	46, 071
Air, Carburetting.....	H. L. McAvoy.....	46, 302
Air, Carburetting.....	W. H. Buckland.....	46, 432
Air, Carburetting.....	J. A. Bassett.....	46, 771
Air, Carburetting.....	W. A. Simonds.....	46, 976
Air, Carburetting.....	J. H. Irwin.....	47, 256
Air, Carburetting.....	J. H. Irwin.....	47, 257
Air, Carburetting.....	J. H. Irwin and I. Simmons.....	47, 258
Air, Carburetting.....	J. A. Bassett.....	47, 272
Air, Carburetting.....	D. Hurd.....	47, 550
Air, Carburetting.....	E. Dunscombe.....	47, 679
Air, Carburetting.....	F. Hainsworth.....	48, 391
Air, Carburetting.....	J. F. Birchard.....	48, 706
Air, Carburetting.....	P. Mihan.....	48, 772
Air, Carburetting.....	W. A. Simonds.....	49, 448
Air, Carburetting.....	J. H. Irwin.....	49, 526
Air, Carburetting.....	M. J. A. Mille.....	49, 596
Air, Carburetting.....	J. B. Terry.....	49, 934
Air, Carburetting.....	E. A. Pond and M. S. Richardson.....	50, 029
Air, Carburetting.....	H. L. McAvoy.....	50, 076
Air, Carburetting.....	C. M. Drennan.....	50, 103
Air, Carburetting.....	J. H. Irwin.....	50, 250
Air, Carburetting.....	J. H. Irwin.....	50, 251
Air, Carburetting.....	E. A. Pond.....	50, 491
Air, Carburetting.....	J. A. Bassett.....	50, 675
Air, Carburetting.....	J. Chase.....	50, 905
Air, Carburetting.....	J. Chase.....	50, 987
Air, Carburetting.....	D. Bickford.....	51, 128
Air, Compressing.....	W. Arthur.....	48, 886
Air-compressing apparatus.....	J. S. Patrick.....	47, 328
Air, Condensed, Treating diseases by.....	O. Stone.....	50, 641
Air, Cooling.....	D. E. Somes.....	50, 286
Air, Cooling.....	D. E. Somes.....	51, 237
Air, Cooling, in buildings and chambers.....	D. E. Somes.....	48, 456
Air-cooling apparatus.....	N. S. Shaler.....	47, 991
Air, Pure, Inhaling.....	B. J. Lane.....	46, 477
Air of rooms, Impregnating with antiseptic vapors.....	A. J. Sax.....	48, 352
Alarms, Burglar.....	B. L. Stone.....	46, 402
Alarms, Burglar.....	A. J. Loomis.....	47, 841
Alarms, Burglar.....	B. L. Stone.....	51, 489
Alarms, Burglar.....	A. W. Decrow.....	51, 511
Alarms, Burglar, and clock.....	E. Warne.....	49, 940
Alarms, Fire, Signal boxes for.....	C. E. Carpenter.....	46, 542
Alarms, Fire and burglar.....	D. Ward and R. S. Luce.....	50, 863
Alarms, Fog.....	G. Hull.....	50, 004
Alarms for railroads.....	C. P. Mortin.....	47, 215
Albums.....	J. D. Mets.....	47, 120
Albums, Photographic.....	R. Van Velthoven and J. H. Hazard.....	50, 521
Albumen and prussiate of potash from blood, Manufacture of.....	A. H. Hirsh.....	51, 181
Alcohol, &c., Distillation of.....	A. Fries.....	48, 711
Alcohol, Manufacture of, Treating grain for the.....	W. M. Watson.....	51, 369
Alcohol, Purifying.....	C. J. Falkman.....	50, 884
Alcohol, Rectifying.....	A. A. Foubert and J. G. Bequet.....
Alkaline solution, Evaporating and calcining.....	M. L. Keen and H. Burgess.....	46, 244
Alloys of aluminum with vulcanite, Construction of.....	N. C. Fowler.....	46, 347
Almanacs, Perpetual.....	W. Gibson.....	50, 430
Alphabet, Cryptographic.....	E. H. Hawley.....	48, 681
Aluminum, alloys of, with vulcanite, Combination of.....	N. C. Fowler.....	46, 347
Aluminum with vulcanite and other materials, Combining.....	N. C. Fowler.....	46, 230
Amalgam, Refining.....	W. Bruckner.....	46, 875
Amalgamating apparatus.....	W. H. Butler.....	49, 975
Amalgamating the precious metals.....	C. A. Seely.....	47, 577
Amalgamator.....	C. C. Peck.....	46, 492
Amalgamator.....	A. W. Hall.....	46, 560
Amalgamator.....	H. H. Scoville, jr.....	48, 030
Amalgamator.....	J. B. Atwater.....	48, 887
Amalgamator.....	I. T. Halsted.....	48, 930
Amalgamator.....	T. J. Chubb.....	49, 232
Amalgamator.....	A. G. Day.....	50, 101
Amalgamator.....	H. Halvorson.....	50, 534

Invention or Discovery.	Name of Patentee.	No.
Amalgamator.....	P. W. Gates.....	50, 5
Amalgamator.....	M. H. Collins.....	51, 0
Amalgamator.....	C. C. Peck.....	51, 0
Ambulances.....	J. M. Hayward.....	47, 7
Ambulances.....	W. Slater.....	47, 99
Ambulances.....	B. Howard.....	48, 40
Anchor.....	G. Coffin.....	48, 37
Anchor.....	E. Snell.....	49, 68
Anchor.....	C. E. Marshall.....	50, 542
Anchor stripper.....	B. H. Heitmann.....	47, 720
Anchor stripper.....	G. Gibson.....	51, 305
Aniline, Colors from, Preparing.....	H. Karcheskie.....	46, 804
Aniline colors for dyeing and printing, Preparing.....	A. S. L. Leonhardt.....	49, 938
Aniline red.....	C. and A. Clemm.....	50, 335
Animals, Tethering.....	W. Johnson.....	49, 681
Animal or vegetable substances, Case for preserving during transportation.....	J. G. Staunton.....	45, 764
Animal and vegetable substances, Preserving.....	F. Stabler.....	50, 965
Animal and vegetable substances, Preserving.....	R. Jones.....	51, 280
Animal yokes.....	A. W. Bishop.....	49, 071
Annunciators.....	H. Horsfall.....	50, 709
Apples, Gathering.....	E. Tyler.....	50, 839
Apples, Grinding.....	R. Butterworth.....	49, 714
Apples, Coring, slicing, and stringing.....	N. Bennett.....	48, 149
Apples, Paring, pressing beefsteak, and sharpening knives.....	B. F. Alexander.....	50, 671
Apple corer and slicer.....	S. Sauerzman.....	48, 981
Apple cutter and corer.....	J. Wroten.....	50, 197
Arms, Artificial.....	I. Stoffel.....	45, 876
Arms, Artificial.....	J. Peterson.....	46, 696
Arms, Artificial.....	H. A. Kimball and A. J. Lawrence.....	48, 002
Arms, Artificial.....	T. Wren.....	48, 659
Arms, Artificial.....	J. Condell.....	51, 238
Arms, Artificial.....	E. Spellerburg.....	46, 158
Arms and hands, Artificial.....	T. Wren.....	46, 159
Arms and hands, Artificial.....	T. Wren.....	46, 365
Arm supporter for rifleman.....	S. Kinman.....	47, 796
Armor, Defensive, Ships.....	S. D. Carpenter.....	49, 407
Armor, Defensive, for vessels.....	C. Holyoke.....	48, 299
Ash pan, drawer, and lifter.....	J. Morrison.....	47, 615
Ash sifter.....	T. W. Brown.....	45, 954
Astronomical instruments.....	C. Emanuel.....	46, 854
Augers.....	E. C. Gillette.....	47, 946
Augers.....	C. L. Griswold.....	50, 887
Augers.....	H. T. Love.....	50, 838
Augers, Attaching, to their handles.....	H. W. Olney.....	47, 172
Augers, Ground.....	D. Ring.....	58, 045
Auger handle.....	D. T. Smith.....	50, 452
Automatic dancer.....	C. Chinnock.....	47, 403
Awls.....	R. Egan.....	50, 479
Awning.....	E. E. Laumont.....	47, 524
Awning and reflector.....	J. Corduan.....	47, 214
Axehelves.....	W. Morehouse.....	49, 156
Axles.....	H. C. Reynolds.....	47, 015
Axles, Car.....	J. W. Hard.....	47, 723
Axles, Car.....	C. P. Hewett.....	50, 796
Axles, Car.....	J. W. Clark.....	50, 458
Axles, Car, Rolling.....	T. Cooper.....	48, 111
Axles, Carriage.....	G. H. Thomas.....	49, 009
Axle box.....	J. Stephenson.....	49, 726
Axle boxes.....	C. Cook.....	49, 772
Axle box.....	E. Lockwood.....	50, 648
Axle box, Carriage.....	T. Wood.....	45, 870
Axle box, Railroad.....	S. T. Shelley.....	49, 054
Axles from iron and steel, Manufacture of.....	H. Bessemer.....	48, 114
Axles for wheel vehicles.....	J. S. Tibbets and W. M. Merriell.....	48, 895
Axles for vehicles.....	W. Beers.....	
B.		
Bags, Feed.....	H. Pennie and C. Chinnock.....	47, 270
Bags, Feed, for horses.....	A. T. Ballantine.....	48, 208
Bags, Holding and filling.....	G. E. Randall.....	47, 324
Bag, Lunch, Travelling.....	J. H. Noyes.....	47, 376
Bags, Paper.....	J. Arkell, B. and A. Smith.....	49, 454
Bags, Paper.....	B. B. Taggart.....	49, 736
Bags, Paper.....	B. F. Ellis.....	49, 951
Bags, Paper.....	E. W. Goodale.....	45, 999
Bags, Paper, Folding.....	E. A. Hollingsworth.....	48, 922
Bag fastener.....	A. C. Fletcher.....	46, 498
Bag holders.....	R. Ramsey.....	48, 083
Bag holder.....	L. W. Morlan.....	48, 911
Bag holder.....	J. S. Corbin.....	51, 320
Bag holder.....	E. Reynolds.....	46, 587
Bag mouth fastener.....	T. K. Reed.....	

Invention or Discovery.	Name of Patentee.	No.
Bag receiver, Railway.....	C. D. Everett.....	50, 668
Balances.....	H. A. Clum.....	46, 992
Balances.....	R. Shaler.....	51, 226
Balances, Spring.....	W. B. Stone.....	46, 592
Balances, Spring.....	H. Saloshinsky.....	48, 211
Balances, Spring, Safety valve.....	T. S. Ray and S. E. Cleveland.....	51, 350
Bale hoop strainer.....	E. A. Field.....	50, 925
Baling and Crushing machine.....	J. Price, jr.....	51, 213
Baling for packing tobacco.....	J. H. Stone.....	50, 047
Balls, Rounding and polishing.....	J. L. Knowlton.....	49, 122
Balls to cartridges, Attaching.....	E. Ellis and G. R. Stetson.....	48, 056
Ball screw for fire-arms.....	A. De Witzleben.....	46, 230
Bands, Metal, Sheet, Joining.....	W. Painter.....	49, 782
Bands, Sheaf, Cutting.....	B. Haines.....	47, 013
Bands for handles.....	C. Perley.....	49, 435
Bands for head screws.....	N. Grant and G. Downs.....	48, 677
Band cutter for threshing machines.....	W. U. Hoover.....	48, 279
Band cutting machines.....	W. U. Hoover.....	48, 280
Banjos.....	F. W. Harlass.....	49, 401
Bank note engraving.....	W. L. Ormsby.....	47, 744
Bark, Tan, Extracts from.....	S. W. Pingree.....	50, 626
Bark, Tan, Treating.....	J. M. Caller.....	48, 365
Barometers.....	G. V. Money.....	47, 971
Barrels, Bungs to, Securing bushes for.....	T. Summerfield.....	47, 877
Barrels, Filling.....	H. A. Webber and C. Reifsnyder.....	51, 370
Barrels, Filling.....	H. A. Webber and C. Reifsnyder.....	51, 371
Barrels, Heads for.....	L. G. Gilliland.....	48, 168
Barrels, Heads to.....	J. Greenwood.....	46, 661
Barrels, Lining, Composition for.....	R. H. Howell.....	47, 825
Barrels, Lining, Composition for.....	L. Held.....	48, 398
Barrels, Lining, for holding oil, &c.....	J. Baur.....	46, 988
Barrel, Lining, for holding petroleum, Composition for.....	L. Francis.....	46, 554
Barrels for containing petroleum, Composition for lining.....	H. Preuss.....	45, 857
Barrels, Oil, Composition for lining.....	H. Loewenberg.....	47, 496
Barrels, Oil, Composition for coating and other purposes.....	J. G. Thompson.....	46, 734
Barrels, Oil, Composition for preserving wood and.....	C. Brandenburg.....	46, 873
Barrels, Oil, &c., Leaking of, Preventing.....	G. T. Parry and W. S. Warner.....	45, 855
Barrels, Oil, Leaking of, Preventing.....	D. Ahl.....	45, 902
Barrels, Oil, Lining.....	J. Baur.....	48, 041
Barrels, Oil, Lining.....	C. B. Hutchinson.....	48, 625
Barrels, Oil, Lining, Composition for.....	W. Budd and J. C. Husband.....	46, 636
Barrels, Oil, Solutions to, Applying.....	J. O. Woodruff.....	506
Barrels, Petroleum, Lining.....	J. Fox.....	47, 810
Barrels, Petroleum, Lining, Composition for.....	R. Price.....	49, 152
Barrels, Petroleum, Lining for.....	W. H. Stone.....	47, 581
Barrels, Petroleum, Lining.....	T. O. Oliver.....	47, 363
Barrels, Rendering impervious to petroleum.....	J. Baur.....	49, 215
Barrels, Vents for.....	T. Simmons.....	50, 176
Barrel fillers, Self closing.....	H. A. Webber and C. Reifsnyder.....	51, 372
Barrel head.....	G. W. Gilbert.....	51, 260
Barrel heads, Cutters for.....	W. H. Bennett.....	50, 677
Barrel heads, Cutting.....	C. R. Thompson.....	46, 508
Barrel heads, Securing.....	J. T. Tomkins.....	45, 771
Barrel machines.....	A. Wykoff.....	51, 643
Barrel machinery.....	G. W. Pierce.....	50, 625
Barrel packers.....	T. Burns.....	47, 253
Barrel rolling device.....	H. W. Stephenson.....	47, 465
Barrel for holding oil.....	J. A. Bassett.....	47, 273
Barrel for holding petroleum.....	G. W. Williamson.....	49, 202
Barrel for holding petroleum.....	L. Day and U. Chapman.....	50, 694
Barrel for holding petroleum, Composition for lining.....	H. Loewenberg.....	46, 060
Barrels to hold petroleum oil, &c., Preparing.....	U. Wurtz.....	46, 518
Barrels for holding petroleum and other oils.....	J. Holland.....	46, 539
Barrels impervious to oil, &c. Composition for rendering.....	G. R. Percy.....	46, 021
Barrels or casks, Hoops on, Driving.....	J. A. Loomis.....	49, 425
Bars, Draught, Railroad.....	R. Fiegel.....	47, 098
Basket.....	T. R. Sherry.....	48, 595
Basket.....	E. A. Jeffery.....	48, 869
Baskets.....	E. B. Lyman.....	49, 774
Baskets, Flower.....	G. Gunther.....	48, 171
Baskets, Forming.....	J. W. Millet.....	47, 602
Baskets, Fruit.....	W. H. Burridge.....	46, 177
Baskets, Fruit.....	J. S. Hoard and C. M. Miles.....	47, 822
Baskets, Fruit.....	J. H. Doolittle.....	49, 390
Baskets, Fruit.....	E. A. Jefferey.....	49, 590
Baskets, Fruit.....	G. Munger.....	50, 486
Baskets, Fruit, or boxes.....	J. H. Doolittle.....	49, 866
Baskets, Manufacturing.....	E. Bredt.....	48, 235
Baskets, Protection for.....	P. Eley.....	47, 996
Basket machines.....	J. B. Sweetland and E. C. Goodrich.....	51, 491
Bathing apparatus.....	C. Schultz and T. Warker.....	50, 499
Batter cup or dish.....	B. Wieland.....	49, 019
Batteries, Carbon, Connectors for.....	C. T. Chester.....	51, 144
Batteries, Galvanic.....	D. J. Browne and C. W. Baldwin.....	47, 389

Invention or Discovery.	Name of Patentee.	No.
Batteries, Galvanic	J. Blakie	49, 824
Batteries, Thermo-electric	M. G. Farmer and H. J. Smith	51, 442
Battery	R. J. Gatling	47, 631
Bayonet attachment	W. Hoffman	47, 303
Bayonets to fire-arms, Attaching	H. Berdan	45, 901
Bed, Crib and sofa	S. Chapin	46, 879
Bed, Invalid	R. H. Mathews	46, 569
Bed, seat, &c., Elastic supports for	J. Perry	50, 840
Bed bottom	F. G. Johnson	45, 832
Bed bottom	C. B. Tucker	47, 757
Bed bottom	C. D. Blinn	47, 789
Bed bottom	P. G. Chase	47, 797
Bed bottom	W. Workman and C. T. Swain	49, 189
Bed bottom	S. Pearson	49, 434
Bed bottom	R. L. Hall	50, 118
Bed bottom	R. S. Sanborn	50, 168
Bed bottom	P. C. Ingersoll	50, 713
Bed bottom	G. N. Seidler	50, 738
Bed bottom	F. Carrie	50, 883
Bed bottom	H. A. Cooke	51, 427
Bed bottom	M. C. Cronk	51, 429
Bed bottom	C. H. Sawyer	51, 624
Bed bottom, Spring	G. E. Lord	46, 119
Bed bottom, Spring	J. B. Bowditch	47, 086
Bed bottom, Spring	S. P. Kittle	51, 061
Bed bottom, Spring slat for	J. M. French	51, 443
Bed clothes retainer, Children's	M. L. Thompson	51, 270
Bed plate for paper mill engines	O. Morse	47, 849
Bedsteads	A. Iske	49, 412
Bedstead	A. Stark	49, 568
Bedstead	J. P. Dorman	50, 920
Bedstead, Camp	C. Fostensen, H. Iverson, and C. J. Skow	48, 671
Bedstead, Folding	J. H. Durand	50, 300
Bedstead, Sofa	E. Brady	47, 512
Bedstead, Sofa, Extension	J. Kena	50, 939
Bedstead, Spring	W. Woods and E. Smith	47, 594
Bedstead, Wardrobe	J. Eby	47, 197
Bedstead bottom	G. Schott	51, 755
Bedstead fastening	J. C. Santee	46, 029
Beefsteak crusher	J. J. Doyle	50, 921
Beehives	O. P. Reeve	45, 859
Beehives	J. Harper	46, 467
Beehives	H. Penoyer	46, 584
Beehives	O. Sprague	47, 047
Beehives	W. Henschen	47, 169
Beehives	D. S. Gray	48, 768
Beehives	T. Burris	49, 375
Beehives	A. J. Smith	49, 563
Beehives	G. Spiny	50, 179
Beehives	H. A. and N. H. King and F. S. Walker	50, 367
Beehives	D. Herman	51, 315
Beehives	G. Defenbaugh	51, 566
Beehives	J. H. Hendricks	51, 716
Beehives, Swarm indicators for	W. W. Snell	50, 639
Bee separator	J. H. Starr	49, 314
Beer, Cooling	J. Hoefer	47, 823
Beer, Making	E. J. Krause	48, 413
Beer, &c., Preserving, Casks for	J. Haege	45, 994
Beer and other liquids, Coolers for	C. W. Cunningham	48, 791
Beer and other liquids, Preserving	T. Byrne	50, 085
Bells, Door	A. Turnbull	48, 242
Bells, Door	C. S. Nickelson	50, 616
Bells, Door, or gong	A. G. Dexter	48, 234
Bells, Door, or gong	H. H. Abbe	48, 637
Bells, Sleigh, Attaching them to straps	W. E. Barton	46, 623
Bells, Dumb, Graduated	G. B. Winship	46, 413
Bel-pull	U. Homer	49, 757
Bellows	G. W. Dalbey	50, 912
Bellows, Paper	M. P. Dorsch	46, 340
Belt clasp	A. D. Ansell	48, 784
Belt clasp	J. N. Plotts	50, 841
Belt coupling	C. G. Rathburn and A. M. Comstock	46, 264
Belt coupling	M. W. Costolo	51, 561
Belts together, Drawing	E. F. Miller and B. Gardner	50, 609
Bench, Moulder's	C. L. Bishop	46, 209
Bench or folding table	R. Carter, jr.	49, 500
Benzole, petroleum, &c., Deodorizing	J. Green	46, 794
Bureau and commode	G. W. Kock	49, 766
Berths, Movable	N. W. Wheeler	47, 481
Bevelling picture-frames	O. F. Bedell	49, 965
Beverage	A. Cochard	46, 081
Beverage	O. C. Howell	48, 405

Invention or Discovery.	Name of Patentee.	No.
Bill-holder.....	C. T. Wakeley.....	46, 282
Billiard balls.....	J. W. Hyatt, jr.....	50, 559
Billiard indicators.....	R. Schmitz.....	45, 668
Billiard tables, Pockets to, Attaching.....	L. Peterson.....	46, 136
Binding for India-rubber fabrics.....	C. A. Ensign.....	51, 161
Binnacles.....	E. S. Ritchie.....	48, 443
Bistouries.....	C. C. Brown.....	50, 330
Bits, Bridle.....	E. Day.....	51, 151
Bits, Drill.....	W. W. Grier and R. H. Boyd.....	47, 812
Bits, Riding and worping.....	C. Perley.....	46, 135
Bit-holders for braces.....	M. V. Nobles.....	51, 660
Bit-stock.....	M. V. Nobles.....	48, 346
Bit-stock.....	C. H. Amidon.....	50, 214
Bit-stock.....	C. E. Lombard.....	50, 480
Bit-stock.....	D. W. Goodell.....	51, 173
Bitters, Tonic.....	O. Hillman.....	47, 204
Blacking.....	A. Tomlinson.....	50, 780
Blacking, &c., Manufacture of.....	R. Bartholow.....	47, 082
Blacking, Water-proof.....	D. L. Pickard.....	50, 383
Blacking-box holder.....	C. E. S. Jelliffe.....	49, 115
Blanket, Printers'.....	J. Taylor.....	49, 804
Blankets of printing machines, Washing.....	T. W. Clark.....	48, 053
Blast apparatus, Hot.....	R. Denholm.....	49, 862
Blasting plug.....	C. Monson.....	50, 263
Blasting rock.....	G. C. Bunsen.....	47, 925
Blasting by electricity.....	T. P. Shaffner.....	51, 671
Blasting by electricity.....	T. P. Shaffner.....	51, 674
Bleaching powder, chlorine, carbonate of soda, and other products, Preparing.....	F. McFarlane.....	49, 597
Blinds, Enamelled, for windows.....	T. J. Olsever and W. P. Elliott.....	51, 345
Blinds, Venetian, for windows.....	C. D. Blinn.....	51, 131
Blinds, Window.....	O. Van Wagenen.....	48, 116
Blinds, Window.....	J. C. Reed.....	51, 268
Blinds, Window, Locking and stopping.....	J. Wetzell.....	48, 003
Blind-fastener.....	G. K. Dearborn.....	50, 532
Blind-fastener.....	D. B. Randall.....	50, 775
Blind-fastening.....	S. Hall.....	47, 816
Blind-fastening.....	L. V. Quimby and W. G. Marston.....	50, 733
Blind-rods, Window, Wiring.....	D. Kelley.....	49, 888
Blood, Albumen and prussiate of potash from.....	A. H. Hirsch.....	51, 181
Blotter.....	C. C. Moore.....	51, 337
Blotters, paper weight, rule, cutter, and square, Combination of.....	A. H. Trego.....	50, 404
Blowers, Fan.....	R. Porter.....	45, 749
Blowers, Hydrocarbon, for furnaces of steam boilers.....	H. Gerner.....	48, 806
Blowers, Steam.....	J. W. Stevens.....	48, 850
Blowers for steam generators.....	D. M. Nichols.....	50, 265
Blowpipe.....	J. Hendy.....	47, 721
Blowpipe or gas-heater for heating soldering-irons.....	E. A. Leland.....	46, 527
Blue, Prussian, Manufacture of.....	J. M. Merryman.....	45, 846
Boats, Ferry, Trainway for.....	N. W. Wheeler.....	47, 479
Boats, Flat-bottom, Construction of.....	H. Haupt and J. Y. Smith.....	48, 935
Boats, Gun, Construction of.....	S. D. Carpenter.....	46, 074
Boat, Life.....	A. L. Shears.....	49, 197
Boats, Sectional folding.....	J. H. Laning and V. Fletcher.....	48, 342
Boats, Steam, Propulsion of.....	A. Fellows.....	47, 003
Boats, Steering from another.....	J. D. Willoughby.....	48, 124
Boats, Torpedo.....	G. M. Ramsey.....	49, 300
Boats, Trains of, Attachment.....	W. Ingalls.....	45, 720
Boats, wainscoting, roofing, tubing tanks, and other structures, Material for.....	J. K. Mayo.....	51, 735
Boat machine.....	H. M. Phillips.....	50, 028
Boat-pin or rigged oar.....	R. Smith.....	49, 930
Bobbin, Sewing-machine, Winding.....	A. W. Todd.....	46, 955
Bobbin-holder for spinning.....	J. Goulding.....	50, 240
Bobbin-holder for spinning.....	J. Goulding.....	50, 241
Bobbin-holder for spinning.....	E. Wright.....	50, 311
Bobbins in shuttles, Securing.....	S. C. Mendenhall.....	49, 643
Boiler, Coffee, Alarm.....	E. K. Sargeant.....	50, 169
Boiler, Composition for removing scales from.....	J. Busby.....	47, 188
Boiler, Egg.....	P. Malapert and E. A. Des Courtis.....	50, 669
Boiler, Furnace-doors for.....	J. Penketh.....	46, 423
Boiler, Fusible plugs for.....	J. Smith.....	47, 076
Boilers, Grate-bars for.....	E. Thayer.....	47, 052
Boilers, Incrustations in, Removing.....	D. Embree.....	45, 914
Boilers, Incrustations in, Removing.....	J. G. Gans and J. J. Lava.....	50, 237
Boilers, Incrustations in, Preventing.....	G. R. Spannagel.....	49, 931
Boilers, Incrustations in, Preventing and removing.....	A. Temple.....	49, 569
Boilers, Iron, Cast.....	J. A. Miller.....	50, 611
Boilers, Locomotive.....	S. Crawford.....	48, 236
Boilers, Metal, Sheet.....	A. O. Neill.....	49, 546
Boiler, Range, Kitchen.....	J. H. Ash.....	47, 783
Boilers, Rotary, for the manufacture of paper-pulp.....	H. B. Meech.....	45, 845
Boilers, Scale from, Compound for removing.....	A. B. Auer.....	47, 914

Invention or Discovery.	Name of Patentee.	No.
Boilers, Scaling tubes to, Tools for.....	J. H. Marvill.....	46, 339
Boilers, Steam.....	J. C. Neill.....	45, 739
Boilers, Steam.....	L. E. C. Martin.....	45, 955
Boilers, Steam.....	E. D. Wood.....	46, 171
Boilers, Steam.....	J. H. Ames.....	46, 203
Boilers, Steam.....	E. B. Sintzenich.....	46, 533
Boilers, Steam.....	E. Reynolds.....	47, 130
Boilers, Steam.....	C. T. Boardman.....	47, 790
Boilers, Steam.....	T. Main.....	47, 968
Boilers, Steam.....	H. Gerner.....	48, 805
Boilers, Steam.....	T. J. Jones.....	48, 870
Boilers, Steam.....	D. Lister.....	49, 125
Boilers, Steam.....	W. M. Storms.....	49, 199
Boilers, Steam.....	T. W. Pratt.....	50, 161
Boilers, Steam.....	H. Hinkley.....	51, 046
Boilers, Steam, Closing hand-hole plates in.....	J. R. Taylor and H. A. Towne.....	49, 170
Boilers, Steam, Ejector for.....	S. Maltby and C. Osborn.....	50, 205
Boilers, Steam, Feed-water heater for.....	W. A. Lighthall.....	46, 252
Boilers, Steam, Hydrocarbon blowers for furnaces of.....	H. Gerner.....	48, 806
Boilers, Steam, Incrustation in, Preventing.....	G. T. Barry.....	50, 773
Boilers, Steam, Incrustation in, Preventing.....	A. F. Porter.....	50, 774
Boilers, Steam, Incrustation in, Preventing.....	W. Brown.....	51, 775
Boilers, Steam, Low-water indicator for.....	G. A. Riedel.....	47, 365
Boilers, Steam, Scale in, Preventing and removing.....	J. Buzby.....	47, 794
Boilers, Steam, Scale-borer for.....	C. H. Keener.....	49, 416
Boilers, Steam, Sectional.....	L. J. Gold.....	51, 448
Boilers, Steam, Sediment-extractor for.....	E. Thayer.....	47, 232
Boilers, Steam, Setting.....	J. Chilcott.....	50, 221
Boilers, Steam, and welding-furnace, Arrangement of.....	H. J. Davidson.....	50, 562
Boiler, Sirup, and evaporator.....	L. Thomas.....	50, 644
Boiler feeders.....	J. W. Bishop.....	47, 180
Boiler feeders, Automatic.....	J. W. Bishop.....	47, 182
Boiler feeders, Automatic.....	J. N. B. Bond.....	47, 791
Boiler feeders, Automatic.....	R. Rafael.....	49, 919
Boiler feeders, Automatic.....	S. Driver.....	49, 949
Boiler feeders, Automatic.....	G. A. Riedel.....	50, 034
Boiler feeders, Automatic.....	G. A. Riedel.....	50, 035
Boiler feeder, Steam.....	C. H. Prentiss.....	51, 392
Boiler flues, Cleansing.....	J. M. Spiegle.....	51, 362
Boiler flues, Scale from, Removing.....	P. E. Garvin.....	49, 255
Boiler tubes, Cleansing.....	J. J. Illingworth.....	48, 948
Boiler tubes, Cutting off, Tool for.....	D. A. Dacey.....	48, 054
Boiler tubes, Fastening.....	R. McConnell.....	49, 287
Boiler tubes, Ferrules for.....	G. W. Durall.....	49, 987
Boiler tubes, Scaling.....	J. Werner.....	49, 327
Boilers for steam heating.....	H. Howard.....	48, 067
Boilers for treating straw.....	T. A. Nixon.....	50, 266
Boilers and condensers, Packing for tubes of.....	J. Newkirk.....	49, 295
Boiling water, Apparatus for.....	H. W. Horton.....	50, 586
Bolts.....	W. J. Lewis.....	47, 113
Bolts, Carriage.....	A. Pond.....	47, 245
Bolts, Cutting.....	J. F. Rogers.....	51, 355
Bolts, Door.....	A. Westcott.....	46, 740
Bolts, Door.....	M. M. Gonnigle.....	48, 297
Bolts, Door.....	W. H. Heart.....	48, 555
Bolts, Door.....	C. Chevallier.....	49, 085
Bolts, Door.....	J. E. Parker.....	49, 296
Bolts, Door.....	W. H. Heart.....	50, 120
Bolts, Door.....	A. P. Floyd.....	51, 034
Bolts, Drawing by hydraulic pressure.....	S. Wilmarth.....	45, 785
Bolts, Heading.....	F. Watkins.....	46, 434
Bolts, Making.....	C. Lusted.....	49, 902
Bolts, Shutter.....	D. E. Heller.....	45, 712
Bolts, Shutter.....	E. Andrews.....	45, 963
Bolts, Screw, for fastening railroad chairs.....	R. J. Dewhurst.....	48, 531
Bolts, Stay and other, Cutting off.....	J. Renshaw.....	46, 703
Bolts, Threads on, Cutting.....	W. W. Hubbard.....	49, 524
Bolt catch, Spring.....	G. M. Morris.....	47, 741
Bolt-heading machine.....	E. Kaylor.....	50, 599
Bolt-heading machine.....	F. Schweizer.....	50, 848
Bolt machine.....	A. Alexander.....	49, 484
Bolt machine.....	E. Kaylor.....	49, 532
Bolt machine.....	A. Marcellus.....	49, 638
Bolt-screwing machine.....	A. Babbett.....	51, 531
Bolts for doors and shutters.....	J. Feldman.....	46, 891
Bolts for flouring mill.....	S. Godfrey.....	50, 466
Bolt and latch.....	M. J. Meyer.....	50, 260
Bolting apparatus.....	H. B. Goodyear.....	46, 658
Bomb lance for killing whales.....	S. Barker.....	46, 437
Bomb lance for killing whales.....	E. Pierce.....	49, 548
Bonnets and Hats, Pressing.....	H. E. West.....	49, 048
Bonnets and Hats, Embossing.....	H. E. West.....	49, 049
Bonnet binding.....	J. L. Weaver.....	46, 163
Book covers.....	J. W. Harrison.....	46, 353

Invention or Discovery.	Name of Patentee.	No.
Book covers	G. F. Barden	49, 213
Book-stand holder	W. W. Marston	49, 639
Boots	E. D. Coffee	49, 723
Boots, Device for pulling on	F. H. More	47, 847
Boots, Gaiter	S. Babbitt	46, 622
Boots, Gaiter	T. Powell	50, 030
Boots, Ladies'	H. W. Libby	48, 188
Boots, Pattern for cutting	A. D. Drew	47, 623
Boots and Shoes	B. D. Godfrey	47, 010
Boots and Shoes	G. P. Clark	47, 521
Boots and Shoes	T. H. Reed	47, 859
Boots and Shoes	E. Chesterman	48, 368
Boots and Shoes	T. D. Ballou	48, 614
Boots and Shoes	I. T. Jones	49, 118
Boots and Shoes	D. Read	50, 163
Boots and Shoes	J. L. Newton	50, 487
Boots and Shoes, Cleaning	O. Lafreniere	51, 195
Boots and Shoes, Constructing	T. C. Andrews	48, 864
Boots and Shoes, Heels of, Shaping	L. R. Blake	47, 696
Boots and Shoes, Heels and toe plates for	J. E. Belser	51, 254
Boots and Shoes, Insole for	I. E. Longborough	47, 115
Boots and Shoes, Lining for	J. K. Gittens	49, 874
Boots and Shoes, Nailed	J. Adams	49, 946
Boots and Shoes, Soles for	L. R. Blake	49, 219
Boots and Shoes, Soles for	J. Chilcott	47, 930
Boots and Shoes, Soles for	S. J. Seely	49, 795
Boots and Shoes, Soles for, Cutting	J. H. Walker	49, 181
Boots and Shoes, Soles for, Cutting	J. H. Walker	49, 572
Boots and Shoes, Soles for, Securing	J. Blakeney	47, 085
Boots and Shoes, Uppers for, Cutting	P. Jackson	50, 360
Boots and Shoes, Uppers of, Holding	E. M. Dickinson	47, 191
Boots and Shoes, Wooden-soled	J. Fulton	50, 236
Boot and shoe holder	J. Ellison	48, 801
Boot and shoe pattern	N. Silvester	50, 043
Boot-blackening case	F. G. Harding	48, 931
Boot crimp	A. and G. W. Caywood	50, 904
Boot-crimping machines	J. D. Batchelor	50, 780
Boot-cutter machine	J. Brooks and C. F. Sylvester	48, 651
Boot drawer, pantaloons guard and spur carrier, Combined	E. P. Walton	45, 776
Boot heel	E. Dunbar	48, 266
Boot heel	F. L. Haywood and P. Stone	48, 662
Boot heel	E. Newhall	50, 026
Boot leg	A. P. Nash	47, 743
Borer, Well	G. L. Witsill and E. Burk	46, 577
Borer for wells	J. Greaves	48, 809
Borer for wells	T. J. Lovegrove	47, 599
Borer for wells	T. J. Lovegrove	47, 600
Boring apparatus	S. R. and W. S. Hunter	47, 727
Boring apparatus for artesian wells	J. Thacker	50, 643
Boring apparatus, Oil	L. Atwood	47, 609
Boring apparatus, Well	C. E. Foster	46, 844
Boring apparatus, Well	T. J. Parke	50, 881
Boring artesian wells	W. A. Fisher	48, 388
Boring artesian wells	T. J. Lovegrove	48, 343
Boring braces	J. A. and H. A. House	49, 758
Boring gin	J. Slusser	47, 993
Boring machines	J. Vandyke	49, 060
Boring machine	D. Stanley and G. Johnson	49, 933
Boring machine for artesian wells	G. W. Wicks	48, 004
Boring tools	M. Joy	49, 277
Boring tools	W. Broadhead	49, 336
Boring tools, Coupling shafts for	R. H. Lecky	47, 554
Boring tools, Coupling shafts for	J. N. Bolles	47, 613
Boring tools, Coupling shafts for	A. A. Wilson	47, 907
Boring tools for artesian wells	H. H. Daniels	47, 804
Boring tools for artesian wells, Operating	J. Ross	50, 777
Boring wells	L. Holmes	47, 724
Boring wells	W. Hyde	47, 729
Boring wells	J. Y. Smith	47, 868
Boring wells	H. Howson	47, 897
Boring wells	W. H. Bechtel	48, 012
Boring wells	M. Campbell and J. H. Cole	48, 515
Boring wells, Apparatus for	H. Howson	46, 849
Boring wells, Device for	J. Donnell	47, 400
Boring wells, Devices for	A. A. Wilson	47, 249
Boring and drilling machine	H. Haupt	47, 819
Boring and extracting coal	A. Buchanan	48, 258
Bosoms and collars, Shirt	C. E. Richards	49, 039
Bottle	C. W. Cahoon	51, 141
Bottle	C. W. Cahoon	51, 142
Bottles, Closing	R. Robinson	46, 864
Bottles, Closing	J. Mathews, jr.	48, 822
Bottles, Filling	J. Mathews, jr.	50, 822
Bottles, frames, &c., Composition for	J. T. Peet	49, 147

Invention or Discovery.	Name of Patentee.	No.
Bottles, Mucilage, Top for	J. W. Broughton	48, 508
Bottles, Opening	J. Mathews, jr.	48, 422
Bottles, Opening	J. Woolaver	50, 868
Bottles, Siphon	G. W. Doty	47, 705
Bottles, Washing	J. Mathews, jr.	49, 538
Bottles for oil	C. W. Cahoon	46, 214
Bottle stopper	E. D. Moyer	48, 300
Bottle stopper	W. Kloenne	48, 341
Bottle stopper	R. T. Osgood	49, 144
Bottle stopper	G. R. Wilmot	49, 671
Bottle stopper	F. Schlich	49, 793
Bottle stopper	C. Goldthwait	49, 996
Bottle stopper	J. A. and G. E. Woodbury	50, 063
Bottle stopper	T. B. Way	50, 864
Bottle stopper	J. Woolaver	50, 867
Bottle and Lamp Chimney, Cleaning	J. T. Walker	49, 458
Bow pin for ox yokes	O. O. Woodruff	47, 119
Boxes	W. T. Slocum	48, 031
Boxes, Ballot	J. A. McPherson	46, 012
Boxes, Blacking	J. H. Doughty	46, 783
Boxes, Blacking	G. W. Bentley	47, 676

Broom.....	D. Young.....	51, 253
Broom and brush.....	M. L. Byrne.....	51, 423
Broom or brush head.....	J. E. Phillips.....	48, 587
Broom and mop head.....	E. J. Green.....	50, 353
Broom clasp.....	S. Parr.....	51, 614
Broom head.....	C. E. Miller.....	48, 195
Broom head.....	F. C. Bolender.....	48, 232
Broom head.....	C. B. Hand.....	48, 392
Broom head.....	T. H. Powers.....	48, 434
Broom head.....	J. D. Browne.....	50, 554
Broom head.....	J. A. Miller.....	54, 610

Invention or Discovery.	Name of Patentee.	No.
Broom head	J. Buchanan	51, 013
Broom head	G. W. Hoffman	51, 318
Broom head	S. D. Thurston	51, 631
Broom head	C. E. Miller	51, 658
Broom head	A. Silvers	51, 663
Broom head	D. J. Brongher	51, 689
Brush	A. M. White	47, 157
Brush	A. Alden	47, 781
Brush	A. Van Dusen	49, 457
Brush, Dusting	C. M. Moody	47, 318
Brush, Fly, for tables	H. Fisher	50, 926
Brush, Hair	J. Mayer	48, 295
Brush, Hydraulic	T. Welham	46, 167
Brush, Mucilage and marking	E. H. Boswell	49, 072
Brush, Paint	L. P. Faught	50, 067
Brush, Whitewash	W. B. Burnett and J. P. McIntosh	45, 907
Brush, Whitewash, Handles to, Attaching	W. B. Burnett and J. P. McIntosh	50, 449
Brush, Whitewash, and handle attachment	W. B. Burnett and J. P. McIntosh	47, 927
Brush and broom	M. L. Payne	51, 423
Brush or broom head	J. E. Phillips	48, 587
Brush and dust pan	C. H. Parker and G. Burnham	48, 582
Brush and dust pan	C. H. Parker and G. Burnham	50, 270
Brush for cannon	P. Birchmeyer	46, 441
Brush for cleaning metallic plates	E. A. Harvey	49, 755
Brush mop, Scrubbing and wringer	L. Frey and J. Hahn	50, 701
Brushing hair, Barbers' apparatus for	C. P. Kroll	49, 893
Bucket, Elevator	J. Magee	51, 603
Bucket, Folding	H. W. Wilcox	46, 168
Buckets, Weighing	D. D. Stell	45, 873
Bucket ear	L. Rowland	47, 573
Buckles	J. Barrister	46, 324
Buckles	J. Barrier	46, 326
Buckles	C. Sears and T. Townsend	46, 948
Buckles	C. E. Woodman and C. B. Hatfield	47, 159
Buckle	J. E. Smith	48, 135
Buckle	C. B. Hatfield	48, 236
Buckle	D. L. Smith	48, 241
Buckle	T. G. Bailey	48, 503
Buckle	B. S. Lawson	48, 569
Buckle	P. White	48, 610
Buckle	W. L. Hall	49, 261
Buckle	C. W. Saladee	49, 309
Buckle	A. H. Cole	50, 337
Buckle	N. Post	50, 386
Buckle	H. Aschenbach	50, 673
Buckle	C. B. Hatfield	50, 706
Buckle	J. Stanbrough	50, 852
Buckle	C. S. Stearns and T. Corey	50, 992
Buckle	J. Peabody	51, 210
Buckle	S. P. Mitchell	51, 606
Buckle	G. O. Monroe	51, 740
Buckle, Belt	F. and C. Lemme	47, 556
Buckle, Harness	C. W. Saladee	47, 574
Buckle, Harness	S. E. Taylor and R. Tattershall	51, 367
Buckle, Lever	L. A. Sprague	46, 719
Buckle, Lever	H. W. Warner	48, 121
Buckle, Loops to, Attaching	L. C. Chase	48, 153
Buckles, Shoe	J. Ellerman	50, 345
Buckles, Trace	W. Wykoff	49, 580
Buckles, Trace	D. F. Maine	50, 017
Buckles, Trace	H. S. Woodruff	50, 979
Buckles, Tug	C. D. W. Rice	47, 570
Buckle attachment	W. E. Barton	48, 039
Buckle fastening	W. Wiley, jr.	50, 195
Buffer and coupling, Car	E. Miller	46, 126
Buildings, Heating	H. Richardson	47, 569
Buildings, Moving	J. S. McIntire	50, 375
Buildings, Removing	J. S. McIntire	49, 427
Buildings, Siding and covering with wood	H. B. Adams	50, 784
Buildings, Staging for	W. Arronquier	47, 179
Building block, Artificial	G. E. Van Derburgh	48, 744
Building block, Silicated	G. E. Van Derburgh	48, 745
Buildings of every description, Cooling and ventilating	D. E. Somes	46, 596
Buildings or rooms for the preservation of food and for other purposes	D. E. Somes	46, 276
Buildings and granaries, Cooling, drying, and ventilating	D. E. Somes	46, 950
Buildings for preserving milk, fruit, &c.	N. W. Clark	49, 604
Bulkheads, Piers and	S. J. Seeley	46, 144
Bullets, Lubricating	A. Ball	47, 784
Bullets for rifled fire-arms	W. Rossee	47, 792
Bumper, Car, Attachment for	J. P. Laird	46, 248
Bungs	O. R. Burnham	51, 422
Bungs for barrels	C. A. Neuhaus	48, 427
Bungs for barrels and other vessels	A. G. Day	48, 377

Invention or Discovery.	Name of Patentee.	No.
Bungs to barrels, Securing bushes for.	T. Summerfield.	47, 817
Bungs for casks.	M. Hickey.	49, 473
Burners, Aero-vapor.	W. Bryant.	51, 011
Burners, Argand, Manufacture of.	E. S. Archer.	46, 063
Burners, Gas.	J. A. Bassett.	47, 786
Burners, Gas.	H. Berg.	47, 787
Burners, Gas.	H. L. McAvoy.	50, 075
Burners, Gas.	V. Dubourg.	50, 429
Burners, Gas.	F. K��p.	50, 431
Burners, Gas.	C. Ritter.	50, 628
Burners, Gas.	J. Stratton.	51, 121
Burners, Gas, Argand.	C. H. Johnson.	48, 340
Burners, Gas, for cooking purposes.	A. Geiss.	51, 170
Burners, Gas, Regulators for.	W. Mallard.	47, 362
Burners, Gas, Vapor.	J. J. Riddle.	50, 845
Burners for gas stoves.	T. J. Kelly.	50, 938
Burners, Gas, and stopcock.	E. Jones.	50, 302
Burners, Hydrocarbon, for cooking and heating.	H. W. Dopp.	48, 379
Burners, Kerosene.	H. and J. Sangster.	48, 459
Burners, Kerosene.	S. R. Wilmot.	48, 860
Burners, Lamp.	A. H. Platt.	46, 138
Burners, Lamp.	J. O. Harris.	46, 901
Burners, Lamp.	J. P. Egan.	47, 625
Burners, Lamp.	J. Wood.	48, 142
Burners, Lamp.	R. S. Merrill.	48, 824
Burners, Lamp, Kerosene.	A. B. Hendryx.	49, 680
Burners, Oil, Coal.	W. W. Batchelder.	47, 381
Burners, Petroleum, for cooking, &c.	J. P. Hayes.	50, 121
Burners, Vapor.	J. Stratton.	49, 955
Burners of carburetted air.	J. A. Bassett.	46, 770
Burners for gas stoves.	E. Osmond.	46, 861
Burners for gas stoves.	W. A. Thompson.	50, 515
Burners for lamps, Suspending.	A. Moore and J. A. Cole.	46, 691
Burners for lamps and lanterns.	J. H. Irwin.	46, 363
Burnisher, Shoemakers'.	R. Egan.	51, 439
Burnisher and eraser.	A. G. Shaver.	49, 558
Burnisher and eraser, Combined.	A. G. Shaver.	49, 559
Burnishing machine.	C. H. Helms.	51, 180
Burnishing machine, Shoe-edge.	N. S. Thompson.	50, 856
Burns and scalds, Curing.	L. Maxwell.	46, 570
Butter moulding machine.	A. Nudd.	48, 088
Butter worker.	L. Roy S. Starrett.	46, 953
Butter worker.	J. P. Adams.	51, 408
Butter worker and churn, Combined.	J. Randall.	49, 550
Butter and other substances, Preserving, Vessels for.	J. G. Staunton.	45, 763
Buttons.	E. S. Wheeler.	45, 781
Buttons.	H. Bock.	46, 330
Buttons.	P. H. Benedict.	46, 772
Buttons.	J. F. Wild.	46, 840
Buttons.	E. Maynard.	47, 843
Buttons.	C. M. Loomis.	48, 079
Buttons.	W. H. Reid.	48, 095
Buttons.	W. B. White.	49, 595
Buttons.	E. T. Barnum.	49, 846
Buttons.	H. Gerner.	50, 927
Buttons, Composition for.	E. S. Wheeler.	50, 974
Buttons, Glass, Holding shank of mould for.	G. Matthewman.	50, 374
Buttons, handles for knives, and other purposes, Material for manufacturing.	L. E. Chittenden.	55, 977
Buttons, Planing.	J. G. Valentine.	46, 763
Buttons, Riveting to cloth.	W. J. Gordon and E. D. Gilbert.	46, 660
Buttons, Sewing to cards.	E. S. Boynton.	49, 674
Button fastening.	F. Dahis.	50, 988
Button-holes.	H. B. Fairman.	48, 484
Button-hole cutters.	F. C. Leypoldt.	48, 962
Button-holes in fabrics, Weaving.	L. J. Knowles.	46, 679
Buttons and studs.	S. E. Ritter.	47, 661
C.		
Cables, Draught, Sliding, for railroads.	A. E. Beach.	49, 697
Cables, Draught, for railroads.	A. E. Beach.	49, 696
Cables, Telegraphic.	W. P. Piggott.	50, 314
Cage, Bird.	C. L. Osborn.	46, 579
Calendar, Perpetual.	H. W. Holly.	45, 795
Calendar, pen-rack, and letter balance, Combined.	H. N. Taft.	45, 770
Calico, Printing.	J. Green.	51, 039
Calipers.	F. O. Washburn.	45, 894
Calipers.	C. E. Brown.	48, 257
Calipers.	B. G. Martin.	51, 517
Calipers.	S. Whalen.	51, 767
Calipers, gauges, and rules, Connecting.	N. H. Bundy.	49, 337
Calks, heel.	T. Symonds.	51, 241
Calks, Horseshoe.	J. L. Pike.	46, 262

Invent'ion or Discovery.	Name of Patentee.	No.
Calks, Horseshoe	C. H. Johnson	47, 360
Calks and horseshoes	C. H. Johnson	47, 495
Calks, Toe	T. Symonds	51, 242
Camera, Photographic	J. Stock	49, 315
Camera, &c., Photographic, Achromatic object, Glass for	H. Roettger	47, 336
Camera, Solar	H. Roettger	47, 862
Camera stand	J. M. Harper	51, 311
Camera stand, Photographic	J. Scouler	46, 396
Cans	H. W. Miller	50, 022
Cans, Fruit	J. Neuberger and P. J. Illig	47, 216
Cans, Metal, Sheet	J. C. Eiben	50, 344
Cans, Milk, Bottom for	A. Burnham	49, 711
Cans, Oil	J. Broughton	46, 635
Cans, Oil	J. M. Perkins and M. W. House	48, 585
Cans, Oil	J. Mayhew	49, 776
Cans, Oil	B. Clark	49, 979
Cans, Oil, Caps of, Protecting	S. Short and E. S. Scripture	50, 742
Cans, Paint, Ears for	E. A. Moore	48, 972
Cans, Preserve	C. F. Brand	46, 176
Cans, Sealed, and other, Opening	P. H. Niles	51, 264
Cans, Tin, Soldering	S. D. Lecompte	50, 011
Cans for tea, sugar, &c.	R. J. Hollingsworth	49, 880
Cans for preserving butter	D. H. Meloy	51, 005
Cans for preserving and transporting milk	W. C. Rentgen	51, 352
Cans and boxes, Metal	M. M. Clark	46, 640
Cans and jars, Lifting	H. Everett	47, 939
Canceller and hand stamp	J. E. Higby	50, 476
Candles, Moulded	J. B. Secor	50, 501
Candles from paraffine, Manufacture of	J. L. Field	46, 197
Candlestick	C. Harvard	50, 000
Candy, Medicated	W. H. H. Hinds	50, 708
Candy, Medicated	L. Morgenthau	47, 504
Candy cigar machine	B. H. Bener and M. H. Burgess	48, 645
Cane stripper	H. Geilhausen	49, 515
Cane stripper	G. E. Sellers	46, 031
Cane stripper	J. A. Hall	49, 260
Cane stripper	W. Gladden and R. F. Bishop	50, 350
Cane stripper	H. Rockwell	51, 482
Cane stripping	T. W. Pierce	49, 785
Cannons, Forging	A. Hitchcock	49, 266
Cannons, Repeating	T. Tufts	46, 762
Cannons, Rim bases of, Turning	E. Kaylor	50, 598
Canteen plates, cup, and funnel	C. O. Farciot	46, 095
Capstan	W. D. Grimshaw	51, 174
Capstan, Power	D. N. B. Coffin, jr.	51, 107
Capstan and screw windlass	H. Heitman and J. Radican	47, 104
Capstan for working beater hay press	P. K. Dederick	49, 678
Capsules	D. Dick	49, 242
Capsules for preventing the soiling of fire-arms	F. L. M. Dorvault	47, 503
Car, Aerial	T. Just and A. Koellener	50, 365
Cars, Coupling and uncoupling	S. H. Hamilton	49, 754
Cars, Freight	L. Myers	48, 800
Cars, Locomotive	H. F. Shaw	50, 282
Cars, Platform, Stake-holder for	E. A. Eddy	48, 799
Cars, Platform, Stake-holder for	E. A. Eddy	48, 800
Cars, Railroad	R. T. M. Wells	45, 778
Cars, Railroad	S. Skillman	45, 871
Cars, Railroad	W. Partridge	49, 648
Cars, Railroad	A. E. Beach	49, 895
Cars, Railroad	G. W. Cook	51, 698
Cars, Railroad, Attaching	J. Fortun	51, 277
Cars, Railroad, Bending and punching the frames of draw-heads for	P. L. Weimer	50, 755
Cars, Railroad, Pedestals for	J. P. Wendell and S. Ustick	50, 427
Cars, Railroad, Propelling	S. G. Randall	47, 858
Cars, Railroad, Road for starting	T. R. Sinclair	51, 626
Cars, Railroad, Running gear of	S. B. Driggs	46, 784
Cars, Railroad, Running gear of	J. Stephenson	49, 904
Cars, Railroad, Running gear of	H. H. Trenor	50, 518
Cars, Railroad, Stake-holder for	A. R. Burdick	45, 891
Cars, Railroad, Ventilating	T. H. B. Sanders	50, 960
Cars, Railroad, Ventilator for	A. P. Vining	50, 522
Cars, Railway	D. H. Dotterer	46, 341
Cars, Railway	S. Valls	47, 156
Cars, Railway	W. S. Hall	48, 553
Cars, Railway	E. H. Derby and T. West	49, 508
Cars, Railway	S. C. Hawkins	50, 472
Cars, Railway, Horse, Starting	W. Henderson and J. W. Fowle	47, 722
Cars, Railway, Sliding doors of	A. G. Safford	49, 308
Cars, Railway, Starting	W. Lawton	49, 770
Cars, Railway, Steam	J. P. Woodbury	46, 043
Cars, Railway, Steam, Street	J. P. Woodbury	48, 008
Cars, Railway, Train and	S. R. Calthorp	49, 227
Cars, Removing, from the track	D. R. Erdmann	49, 737

Invention or Discovery.	Name of Patentee.	No.
Cars, Revolving	D. Lott	49, 126
Cars, Sleeping	C. T. Harvey	48, 393
Cars, Sleeping	B. Field and G. M. Pullman	49, 992
Cars, Starting	A. F. French	49, 195
Cars, Street, Propulsion of	C. M. Mann	48, 081
Cars, Street, Switching	J. S. Reid	48, 978
Car bumper attachment	J. P. Laird	46, 248
Car platform stake-holder	C. A. Bryan	48, 899
Car tracks, Railway	D. H. Dotterer	49, 510
Car truck frames	D. B. Rogers	47, 863
Car trusses, Railroad	J. F. Keeler	45, 834
Carbine sockets	J. S. P. Taylor	48, 462
Carbon batteries, Connection for	C. T. Chester	51, 144
Carbonic acid gas, Generating	P. and F. Hinkel	47, 205
Cards, Match	M. G. Crane	49, 727
Cards, Match splint	B. Hotchkiss	48, 176
Cards, Paper, Collars, &c., Removing from embossing press	T. Tebbetts	50, 514
Card mount, Photographic	T. Mayhew	46, 008
Card or curry-brush	J. Voak	46, 510
Carding, picking, and other similar engines, Means for feeding wool and other fibrous material to	S. R. Parkhurst	47, 976
Carding cylinders, Closing	A. A. Hawley	49, 679
Carding engine, Doffing apparatus for	R. Lord and L. Hutton	46, 120
Carding engine, waste-saving attachment to	A. A. Bennett	47, 274
Carding machines	D. Tainter	47, 345
Carding machines	D. Tainter	47, 668
Carding machines	P. S. Haines	48, 059
Carding machines, Oiling wool in	G. S. Harwood	46, 104
Carding machines, Oiling wool in	J. Eccles	47, 767
Carding machines, Wool in, Oiling	J. W. Hutsey	46, 189
Carding machines, Wool in, Oiling	J. Shinn	46, 194
Cargo of a sunken vessel, Discharging	P. E. Falcon	49, 026
Carpenters' squares, Indicating	H. K. Jones	46, 191
Carpets, Flooring or dust rack for	G. J. Colby	48, 907
Carpet bags	N. Grod	50, 815
Carpet fastener	J. O. Jones	48, 410
Carpet fastener	W. B. Blaisdell and J. E. Atwood	49, 850
Carpet fastening	G. W. Andrews and J. P. Burnham	49, 600
Carpet stretcher	N. Hill	46, 357
Carpet stretcher	G. G. Mudge	48, 829
Carpet stretcher	F. J. Collier	48, 882
Carpet stretcher	H. A. Mead	48, 968
Carpet stretcher	J. Boyd	51, 545
Carriages	L. W. Mason	47, 211
Carriages	E. Robbins	48, 310
Carriages, Children	O. Mather	48, 821
Carriages, Double-tree for	J. Hoover	46, 904
Carriages, Horse	R. Perine and S. M. Stewart	47, 330
Carriages, Journal boxes for	E. P. Palmer	50, 948
Carriages, Railing	T. West	47, 143
Carriages, Railway	L. H. West	49, 942
Carriages, Thills to, Connecting	B. E. Sampson	48, 313
Carriages, Thills to, Coupling	D. C. Breed	45, 812
Carriages, Wagons, &c.	E. Lane	51, 196
Carriages or sleds	H. Smith	47, 580
Carriage knobs	R. P. Cowles	48, 373
Carriage tops	J. Enders	48, 386
Carriage tops	K. T. Hurlburt	48, 688
Carriage tops	L. Z. Dodds and R. Walsh	49, 611
Cart, Ash	R. A. Smith	45, 761
Cartridges	S. Jackson	45, 830
Cartridges	T. P. Shaffner	51, 672
Cartridges	T. P. Shaffner	51, 673
Cartridges, Balls to, Attaching	D. Ellis and G. R. Stetson	48, 056
Cartridges, Compressing around bullets	J. S. Adams	48, 010
Cartridges, Metallic	H. C. Spalding	46, 034
Cartridges, Metallic	E. Allen	47, 688
Cartridges, Metallic	T. J. Powers	50, 536
Cartridges, Metallic, Coupling	T. J. Powers	47, 246
Cartridges, Metallic, Priming	E. Martin	48, 820
Cartridges, Metallic, Priming	S. Crispin	49, 237
Cartridges, Metallic, Priming	C. Jackson and J. G. Pusey	50, 592
Cartridges, Metallic, Priming	T. T. S. Laidley	51, 324
Cartridges, Tobacco	A. C. Breckenridge	51, 255
Cartridge box	M. V. B. White	46, 411
Cartridge box	W. Rossiter	49, 304
Cartridge box	A. D. Laidley	49, 420
Cartridge box	J. Pease	50, 730
Cartridge box, Revolving	C. Howlett	49, 523
Cartridge cases, Metallic	W. C. Dodge	48, 536
Cartridge cases, Nicking	B. Payne	50, 489
Cartridge retractor for breech-loading fire-arms	F. Beals	46, 207
Cartridge retractor for breech-loading fire-arms	E. Allen	46, 617
Cartridge retractor for breech-loading fire-arms	H. H. Walcott	48, 227

Invention or Discovery.	Name of Patentee.	No.
Cartridge retractor for breech-loading fire-arms	J. Gray	48, 337
Cartridge retractor for breech-loading fire-arms	E. Maynard	48, 966
Cartridge retractor for breech-loading fire-arms	G. P. and G. Foster	49, 994
Cartridge retractor for breech-loading fire-arms	E. S. Piper	51, 391
Cartridge retractor for breech-loading fire-arms	T. L. Sturtevant	50, 854
Cartridge retractor for many chambered fire-arms	W. C. Dodge	45, 912
Cartridge for breech-loading and rifled fire-arms	H. Berdan	46, 992
Cartridges for small arms	D. M. Mefford	47, 317
Carts, Hay, Self-loading	E. Holt	45, 715
Cases, boxes, &c., Air-tight	J. G. Staunton	45, 766
Cases for jewels	G. F. Kolbe	47, 430
Cases for preserving animal and vegetable substances during transportation	J. G. Staunton	45, 764
Casks, Gauging and ullaging	W. W. Cooper	50, 689
Casks, Heads of	E. P. Spaulding	47, 717
Casks, Rendering oil-proof	S. Gardner	50, 238
Cask for preserving beer, &c.	J. Hæge	45, 994
Cast from the face of living persons, Taking	C. Mills	47, 121
Caster bottle-holder	A. E. Young	49, 840
Caster bottle-holder	A. E. Young	49, 841
Caster for furniture	A. Walker	45, 773
Caster for furniture	R. J. Beardsley	46, 334
Caster for furniture	F. G. Ford	47, 007
Caster for furniture	N. T. Merseureau	47, 117
Caster for furniture	M. L. Babb	48, 146
Caster for furniture	P. B. Holmes	50, 249
Castings, Chilled	G. W. Bollman and W. Neemes	50, 680
Castings, Composition for	G. Nimmo	48, 973
Castings, Cores for, Making and ventilating	J. Harrison, jr.	49, 264
Castings stereotyped plates	W. F. Draper	51, 437
Castings tackle blocks	J. W. Norcross	47, 656
Catamenial sacks	E. L. Perry	49, 915
Cattle stanchions	H. Maycock	45, 728
Cattle tie	J. Ives	49, 630
Cement	J. Stansfield	50, 184
Cement, Asphaltic	I. G. Reinhold	46, 975
Cement pipes	J. E. Earle	49, 827
Cement pipes	W. Goodwin	49, 828
Cement for steam joints	J. G. Kilgour	51, 060
Centre, Dead, Lifts for	J. J. Gorman	46, 102
Centre board	G. M. Fay	49, 514
Centre of circles, Finding, Instrument for	E. P. Rogers	50, 275
Chains, Horse	H. W. Knowlton	48, 957
Chain holder	S. Gladding	48, 675
Chain links, Bending	P. L. Welmer	50, 758
Chain links, Swaging	V. Draper	50, 200
Chain links, Trimming	T. Van Patten	51, 102
Chains for water elevators	P. Anderson	47, 595
Chairs	J. A. and H. A. House	48, 177
Chairs, Adjustable	J. Habermehl	48, 272
Chairs, Dental	T. Weaver	45, 887
Chairs, Dental, Operating	W. M. Butler	51, 553
Chairs, Invalid	J. O. Whitecomb	50, 291
Chairs, Nursery	T. J. Blackburn and E. P. Terrell	49, 849
Chairs, Railroad	S. Rainey	50, 215
Chairs, Railroad	J. H. Jones	46, 802
Chairs, Railroad	H. W. Warner	50, 309
Chairs, Railroad, Bolt screw for fastening	J. A. Roebing and J. McMurtry	50, 776
Chairs, Railroad, Wrought Iron	R. J. Dewhurst	48, 531
Chairs, Railway	J. H. Mabbett	46, 370
Chairs, Railway	J. E. Williams	47, 484
Chairs, Railway	W. H. Peckham	47, 747
Chairs, Railway	B. T. Milburn	48, 873
Chairs, Railway	J. L. Hills	49, 107
Chairs, Railway	J. Cochrane	49, 722
Chairs, Reclining	H. Thompson	47, 469
Chairs, Sheep	O. Barker and G. E. Blakelee	49, 067
Chairs, Sick	C. H. Bayley	47, 509
Chair bottom	C. Russell	50, 166
Chair bottom or back	W. Bramhill	51, 132
Chair seat	E. Ransom	50, 955
Chair splints, Cutting	W. N. Davey	45, 790
Chair and coupling, Railroad	W. Hendershott	47, 820
Chair and cradle	G. W. Hawk	47, 542
Chair and scale, Child's exercising	T. Shedd and F. Glockner	51, 091
Chair and stool, Barber's	H. Remick	50, 032
Chair or table, Folding	F. Ludke	46, 121
Chalk holder for billiard tables	H. M. Wall	51, 499
Chandelier	P. Loth	47, 312
Charcoal, Cleansing and revivifying	G. A. Gasper	47, 308
Checks, Baggage	J. Murdock, jr., and W. W. Spencer	49, 543
Check boxes, Conductors'	T. W. Knox	47, 646
Cheese, Curd of, Cutting the	S. Thomson	46, 735
Cherry-stoner and pea-sheller	G. Sanford	50, 278

Invention or Discovery.	Name of Patentee.	No.
Cherry-stoning machine	T. Van Kannel	48, 137
Chest, Flour	M. W. Hill	49, 404
Chest and table	G. W. Zeigler	49, 821
Chimney	C. C. Phelps	47, 448
Chimney, Gas-burner	J. Stratton	49, 010
Chimney, Lamp	W. H. Culp	49, 089
Chimney, Lamp	J. G. Floyd	49, 993
Chimney, Lamp, Handles for	M. W. Brown	46, 212
Chimney, Lamp, Moulding	E. Ettinge	50, 105
Chimney, Lamp, Removing	G. Asmus	48, 354
Chimney, Lamp, and bottles, Cleansing	J. T. Walker	49, 458
Chimney cap	G. W. Demond	47, 525
Chimney caps	J. H. Kirkwood	49, 890
Chimney cap	W. H. Horton	50, 002
Chimney cap	E. Hinkley and G. W. Crowell	50, 086
Chimney top	B. A. Hendrikson	50, 356
Chlorine, bleaching powder, carbonate of soda, and other products, Preparing	F. McFarlan	49, 591
Chromium, Salts of	B. Margulies	49, 682
Chronometer escapement	C. Fasoldt	46, 652
Chronometer escapements	H. Rothfelder	48, 726
Chronometer escapements	J. Karr	51, 191
Chucks	M. Straub	50, 747
Chucks, Universal	W. H. King	47, 428
Chucks, Self-entering	T. H. Worrall	46, 747
Chucks, Self-entering	T. Brooks	50, 329
Chucks, Self-entering	S. T. Jackson	50, 593
Chucks, Self-entering	T. H. Worrall	48, 612
Chucks, Scroll	A. F. Cushman	50, 691
Chucks, Scroll	A. F. Cushman	51, 384
Chucks for lathe	S. J. Cone	48, 521
Churns	A. W. Hall	46, 185
Churns	D. C. Aldrich	46, 202
Churns	E. L. Bergstretter	46, 440
Churns	J. N. Pease	46, 695
Churns	A. Westcott	46, 739
Churns	J. Aiken	46, 749
Churns	H. Allen, jr.	46, 766
Churns	E. Chipman	46, 880
Churns	J. Rankin	47, 129
Churns	S. E. Saul	47, 134
Churns	H. P. Westcott	47, 145
Churns	E. J. Phillips	47, 219
Churns	A. O. Gallup and E. A. Hewett	47, 292
Churns	C. F. Baylor	47, 383
Churns	C. T. Anderson	47, 507
Churns	W. Hozier	47, 952
Churns	A. Rhoades	48, 096
Churns	R. Reese	48, 182
Churns	G. Hart	48, 277
Churns	E. F. Holloway	48, 278
Churns	J. F. Sanborn	48, 449
Churns	I. M. West	48, 469
Churns	W. Edmister and S. Johnson	48, 666
Churns	C. G. Bishop	48, 786
Churns	H. Hutchinson	48, 815
Churns	H. Seggs	48, 987
Churns	A. Newbrough	49, 138
Churns	H. L. Hervey	49, 345
Churns	W. H. Slonaker	49, 450
Churns	B. L. Winner	49, 464
Churns	A. A. Newman	49, 646
Churns	E. Kenney	50, 009
Churns	W. L. Imlay	50, 129
Churns	J. B. Ghormley	50, 349
Churns	W. Robinson	50, 631
Churns	J. Thompson	50, 645
Churns	T. J. Burke and S. B. Gassette	50, 684
Churns	R. L. Shute	50, 963
Churns	A. R. Morehouse	51, 073
Churns	D. F. Ward	51, 246
Churns	T. M. Hill	51, 320
Churns	J. J. Robinson	51, 354
Churns, Operating	J. Redding	48, 004
Churns, Pneumatic	A. J. Smith	47, 697
Churn dasher	D. McCurdy	46, 810
Churn dasher	N. Starbuck	46, 952
Churn dashers	D. Johnson	47, 259
Churn dasher	E. M. Wright	47, 763
Churn dasher	J. Hobbs	50, 122
Churn dasher	M. J. Smith	50, 851
Churn dashers, Moving	A. W. Hall	46, 970
Churn and butter-worker, Combined	J. Randall	49, 550

Invention or Discovery.	Name of Patentee.	No.
Corks, Slicing	J. Power	49, 299
Cork machines	H. Boardman	49, 971
Cork pull	F. G. Biefield and C. E. E. Schwartz	47, 161
Corn-horse for stacking corn	L. S. Barker	51, 540
Corn huskers	E. F. French	47, 710
Corn husker, sheller, and cleaner	C. J. Legg	48, 077
Corn husking	J. M. Hubbard	57, 598
Corn sheller	D. Hutchinson	45, 924
Corn sheller	P. Sweeny	46, 155
Corn sheller	G. Ketchum	46, 245
Corn sheller	J. Brinkerhoff	46, 540
Corn sheller	J. H. Schroeder	47, 988
Corn sheller	G. W. Fitts	48, 670
Corn sheller	J. W. Ricker and T. S. Lewis	49, 303
Corn sheller, Feeding corn to	H. F. and G. F. Shaw	50, 740
Corn-stalks in the ground, Cutting	H. C. Robinson	45, 862
Cornets	T. W. McDill	48, 704
Corsets	L. Schreiber	49, 925
Corsets	C. Preston	47, 856
Corset clasp	J. Bowers	48, 045
Cotton, &c., Combing	R. W., D. G., and H. E. Fowler	50, 524
Cotton, Gun	I. Dimock	49, 865
Cotton, Gun	J. J. Revy	50, 082
Cotton, Gun, and lint	J. J. Revy	50, 083
Cotton, linen, &c., Dyeing and printing	J. P. McLane	47, 316
Cotton-bale raft	A. Parof	50, 885
Cotton chopper, cultivator, and drill	T. Bryne	51, 140
Cotton gins	J. A. Hall	49, 104
Cotton gins	W. B. Emory	47, 626
Cotton gins	F. Durand	50, 080
Cotton gins, Roller for	C. Brakell	51, 402
Cotton-seed planter	I. F. Brown	45, 695
Couplings	I. Myers and M. D. Wellman	46, 132
Coupling	W. N. Abbott	46, 603
Coupling, Car	G. E. Clark	51, 695
Coupling, Car	L. Moody	45, 733
Coupling, Car	M. Rinehart	45, 939
Coupling, Car	C. Clinton	46, 336
Coupling, Car	P. J. Gross	46, 465
Coupling, Car	F. M. Gifford	46, 656
Coupling, Car	T. Tripp	46, 958
Coupling, Car	E. P. Howland	47, 108
Coupling, Car	J. H. Reed	47, 455
Coupling, Car	H. M. Rulon	47, 985
Coupling, Car	G. C. Lawton	48, 076
Coupling, Car	W. C. Clark	48, 617
Coupling, Car	S. S. Chaney	48, 656
Coupling, Car	J. W. Boughton	48, 787
Coupling, Car	W. C. Morse	49, 292
Coupling, Car	S. D. Locke	49, 348
Coupling, Car	J. Couch	49, 385
Coupling, Car	J. G. W. Coolidge	49, 676
Coupling, Car	A. J. Hobbs	49, 879
Coupling, Car	J. Lacey and G. Watkins	50, 010
Coupling, Car	A. Melet and J. T. Fry	50, 148
Coupling, Car	L. Moody	50, 152
Coupling, Car	G. G. Campbell	50, 559
Coupling, Car	S. A. Corser	50, 797
Coupling, Car	H. H. Flemming	50, 811
Coupling, Car	H. S. Shepardson	50, 882
Coupling, Car	E. W. Wilson and J. E. Erwin	50, 994
Coupling, Car	A. G. Page	51, 209
Coupling, Car	A. S. Markham	51, 330
Coupling, Car	G. L. Kitson	51, 461
Coupling, Car	T. Arndt	51, 535
Coupling, Car	L. Moody	51, 608
Coupling, Car, Railroad	H. J. Gilman	48, 926
Coupling, Car, Railway	A. Roll	51, 223
Coupling, Gas-pipe	D. L. Freeborn	50, 111
Coupling, Pipe	A. E. Barnard	48, 038
Coupling, Pipe	J. Chamber	48, 517
Coupling, Pipe	A. M. George	48, 674
Coupling, Pipe	C. W. Emery	48, 709
Coupling, Pipe	W. Dutemple	48, 797
Coupling, Pipe	J. Old	49, 142
Couplings, Railway	J. Old	50, 619
Coupling, Rod, Connecting	D. H. Hise	45, 713
Coupling, Thill	H. S. Dodge	51, 512
Coupling, Thill	H. K. Waterhouse	50, 189
Coupling for carriages	J. W. Innis	51, 457
Coupling conducting wire	J. Bundy	48, 653
Coupling for drill or pump rods	G. W. Beardslee	47, 918
	J. R. Cross	49, 386

Invention or Discovery.	Name of Patentee.	No.
Coupling for railroad cars.....	J. R. Hill.....	50, 824
Coupling shaft.....	G. H. Fox.....	50, 700
Coupling shaft for carriages.....	F. B. Morse.....	47, 154
Coupling shaft, Jack for.....	A. J. Settle.....	48, 984
Coupling shaft for boring tools.....	J. N. Bolles.....	47, 613
Coupling shaft of boring tools.....	J. Esler.....	48, 667
Coupling shaft for boring tools.....	R. H. Lecky.....	47, 535
Coupling shaft of boring tools.....	J. Watson.....	50, 190
Coupling shaft of boring tools.....	E. Kayler.....	50, 138
Coupling shaft of boring tools.....	A. A. Wilson.....	47, 907
Coupling shaft of boring tools.....	D. G. Coppin.....	48, 793
Coupling shaft of boring tools.....	R. H. Lecky.....	47, 554
Coupling shaft of boring tools.....	J. B. Stockton.....	50, 287
Coupling shaft for clutch pulleys.....	E. O. Potter.....	51, 619
Coupling for shafting, &c.....	R. Briggs.....	47, 388
Coupling spring, Gum elastic.....	S. M. Hoover.....	47, 305
Coupling for thills.....	E. D. Clapp.....	47, 520
Coupling tools for drilling.....	J. and R. Moore.....	47, 031
Coupling and buffer, Car.....	E. Miller.....	46, 126
Coupling and chair, Railroad.....	W. Hendershott.....	47, 820
Cradle, Self-rocking.....	H. G. Williams.....	46, 744
Cradle and chair.....	G. W. Hawk.....	47, 542
Cradle and crib.....	H. H. Eastman.....	46, 091
Cranberry gatherer.....	G. Shove.....	46, 760
Cranberry gatherer.....	C. Thacher.....	48, 136
Cranes.....	B. J. Burnett.....	46, 213
Cranes, Elevating.....	J. T. Wright.....	49, 579
Crank to machinery, Attaching.....	A. Westcott.....	47, 885
Crank-pin boxes.....	T. Welch.....	49, 185
Crank, wrist connections.....	J. Clayton.....	47, 522
Crib, Bed, and sofa.....	S. Chapin.....	46, 879
Crib and cradle.....	H. W. Eastman.....	46, 091
Crimping machine, Boot.....	J. S. Landes.....	46, 427
Crimping and shoeing forms.....	J. H. Jillson.....	50, 074
Croquet mallets.....	L. Byrnes.....	51, 016
Crucible.....	G. Nimmo.....	49, 141
Crucible, Drying and preparing.....	G. Nimmo.....	48, 713
Crucible, Moulding.....	G. Nimmo.....	49, 140
Crucible for metallic baths.....	B. S. Stokes.....	49, 009
Crupper.....	F. Howe.....	47, 953
Crusher, Clod.....	W. Fenstermacher.....	45, 705
Crushing machines.....	A. Hitchcock.....	50, 247
Crushing and baling machine.....	J. Price, jr.....	51, 212
Crutches.....	T. E. Gordon.....	45, 709
Crutches.....	G. F. Alamy and J. G. Bugbee.....	47, 265
Crutches.....	A. Bieckel.....	47, 695
Crutches.....	G. T. Alamy and J. G. Bugbee.....	51, 677
Crutch-pot, Revolving.....	J. G. Bugbee.....	49, 371
Cryptographic alphabet.....	E. H. Hawley.....	48, 681
Cuffs, collars, &c., Manufacture of.....	A. Taylor.....	50, 513
Culinary and household operations, Facilitating.....	H. S. Shepardson.....	50, 779
Cultivating land by steam.....	J. Fowler, jr.....	45, 892
Cultivators.....	I. Barber, jr.....	45, 687
Cultivators.....	A. B. Cass.....	45, 700
Cultivators.....	L. Sherwood.....	45, 758
Cultivators.....	T. Wiles and J. McGinnis.....	45, 782
Cultivators.....	W. D. Ament.....	45, 807
Cultivators.....	A. Keck.....	45, 833
Cultivators.....	C. Roberts.....	45, 860
Cultivators.....	C. Roberts.....	45, 861
Cultivators.....	E. H. Sawyers.....	45, 866
Cultivators.....	E. C. Patterson.....	45, 934
Cultivators.....	J. W. Fawkes.....	45, 987
Cultivators.....	C. Lidren.....	46, 116
Cultivators.....	S. Gulick.....	46, 349
Cultivators.....	S. Henry.....	46, 355
Cultivators.....	E. Minnick.....	46, 376
Cultivators.....	J. W. Ingle and R. H. Wright.....	46, 675
Cultivators.....	I. A. Palmer.....	46, 383
Cultivators.....	J. Harper.....	47, 017
Cultivators.....	J. M. Jenne.....	47, 021
Cultivators.....	J. H. Thomas and P. P. Mast.....	47, 055
Cultivators.....	G. F. Hassenpflug and G. Barnhart.....	47, 105
Cultivators.....	T. J. Potts and P. C. Yost.....	47, 332
Cultivators.....	L. B. Barton.....	47, 380
Cultivators.....	R. Marsh.....	47, 439
Cultivators.....	W. Rhodes and M. Porter.....	47, 568
Cultivators.....	J. Hollingsworth.....	47, 641
Cultivators.....	W. Bank-on.....	46, 537
Cultivators.....	L. D. Haugley.....	46, 066
Cultivators.....	J. Mills.....	47, 655
Cultivators.....	J. H. Gwin, H. Hutsonpiller, and C. Gilbert.....	46, 657

Invention or Discovery.	Name of Patentee.	No.
Cultivators	W. E. Bates	47, 693
Cultivators	J. Brewer	47, 699
Cultivators	P. S. Carhart	47, 618
Cultivators	E. Phifer	47, 904
Cultivators	S. G. Horning	48, 066
Cultivators	H. Howe	48, 068
Cultivators	W. G. Savage	48, 102
Cultivators	E. S. Gillies	48, 271
Cultivators	B. Holtz and W. Enoch	48, 281
Cultivators	H. M. Teasdale	48, 324
Cultivators	J. T. Bever	48, 358
Cultivators	C. Roberts	48, 445
Cultivators	H. S. Mead	48, 575
Cultivators	J. Lacey	48, 627
Cultivators	L. G. Youngs	48, 758
Cultivators	P. H. Allstott	48, 783
Cultivators	C. M. Jenne	48, 817
Cultivators	W. D. Ament	48, 884
Cultivators	F. C. Leffler	48, 959
Cultivators	G. B. St. John	49, 008
Cultivators	J. Brewer	49, 075
Cultivators	H. Ingraham	49, 111
Cultivators	G. Ekstrand and A. P. Cassell	49, 512
Cultivators	E. McEwen	49, 540
Cultivators	J. G. Page	49, 547
Cultivators	H. H. Webster	49, 667
Cultivators	G. Calkins	49, 715
Cultivators	J. A. Bardell	49, 845
Cultivators	L. B. Walker	49, 938
Cultivators	A. J. Manny	50, 018
Cultivators	J. P. Tostevine	50, 052
Cultivators	W. J. Burton	50, 093
Cultivators	A. Bouton	50, 217
Cultivators	W. H. L. King	50, 141
Cultivators	I. Denham	50, 229
Cultivators	R. McCorkell	50, 257
Cultivators	R. Thayer and J. McClelland	50, 403
Cultivators	L. B. Barton	50, 439
Cultivators	D. Churchill and S. C. Brewer	50, 453
Cultivators	S. Hall	50, 930
Cultivators	J. Fernald	51, 031
Cultivators	H. Ingraham	51, 055
Cultivators	W. W. St. John	51, 096
Cultivators	J. T. Bever	51, 286
Cultivators	B. A. Grant	51, 306
Cultivators	J. Townsend	51, 365
Cultivators	J. Copeland	51, 428
Cultivators	J. H. Thomas, P. P. Mast, and T. Harding	51, 494
Cultivators	D. Dennett	51, 567
Cultivators	J. Armstrong	51, 680
Cultivators	W. H. Howell	51, 721
Cultivators, Corn	J. Harper	47, 016
Cultivators, Corn	J. Chapman	49, 856
Cultivators, Hand	J. Naugle	46, 926
Cultivators, Horse-hoe	A. Webb	49, 354
Cultivators, Root, and weeder	C. Jarvis	45, 831
Cultivator, seeder, and roller, Combined	J. P. Long	46, 480
Cultivator, Teeth for	H. Francisco	46, 664
Cultivator, Wheel	A. P. Durant and D. M. Buckley	46, 550
Cultivator and corn planter, Combined	J. Palmer	48, 991
Cultivator and gang plough	S. H. Mitchell	46, 378
Cultivator and grain drills, Combined	E. Badlam	50, 438
Cultivator and harrow	T. Short	46, 274
Cultivator and harrow, Combined	E. D. and O. B. Reynolds	46, 025
Cultivator and planter	E. M. Wright	49, 204
Cultivator and planter, Combined	D. W. McCaffey	47, 029
Cultivator and potato digger, Combined	M. and J. W. Chandler	48, 616
Cultivator and seeder, Combined	P. Simhold	49, 661
Cultivator and seeder, Combined	C. Norwood	47, 975
Cultivator and seeder, Combined	S. Keller	48, 871
Cultivator, seeder, and potato planter, Combined	B. F. Field	50, 202
Cultivator and seeding machine, Combined	O. M. Pond	48, 590
Cups, Drinking, for the sick	M. P. Codman	50, 906
Cups, Funnel, and canteen plates	C. O. Farciot	46, 095
Cups, Grease	G. Hugemeyer	49, 259
Cups, Lubricating	J. Sangster	48, 776
Cups, Oil	E. Weissenborn	45, 945
Cups, Oil	R. Poole	49, 352
Cups, Oil, Globe	V. Girond	49, 624
Cups, Oil, Tip for	T. P. Ploghar and W. Shöllhorn	46, 586
Cups, Oil, ejecting	H. E. Stager	50, 183
Curry-brush and card	J. Vonk	46, 510
Curtain, Window, Cord tightener for	M. Hay	51, 045

Invention or Discovery.	Name of Patentee.	No.
Curtain clasp.....	J. G. Whittier and T. M. Powell.....	50, 193
Curtain fastening.....	J. R. Cook.....	49, 381
Curtain fixture.....	J. Chase and W. S. Loughborough.....	47, 392
Curtain fixture.....	J. B. Bailey.....	47, 891
Curtain fixture.....	H. H. Trenor.....	49, 571
Curtain fixture.....	P. Miles.....	50, 149
Curtain fixture.....	E. M. Judd.....	51, 594
Curtain knobs.....	C. Z. Kroh.....	49, 634
Cutlery.....	C. L. Butler.....	51, 648
Cutlery, edge tools, &c., Substance for making.....	T. H. Jenkins.....	51, 724
Cutlery, Table.....	N. Mills.....	46, 304
Cut-off, Variable.....	W. G. Pike.....	51, 081
Cutter, Beef and vegetable.....	W. and J. T. Bird.....	51, 288
Cutter, Bolt.....	E. Schlenker.....	48, 594
Cutter, Bolt.....	R. Sischo.....	50, 395
Cutter, Bolt.....	G. A. Rees.....	51, 300
Cutter, Bolt.....	C. Draper.....	46, 003
Cutter, Bread.....	F. Hüllhorst.....	47, 450
Cutter, Bread.....	J. T. Plass.....	48, 127
Cutter, Bread.....	J. Buckett.....	48, 985
Cutter, Bread and meat.....	S. D. Simmons.....	49, 225
Cutter, Button-hole.....	W. Budd and J. L. Husband.....	46, 028
Cutter, Button-hole.....	F. G. Sanborn.....	48, 962
Cutter, Cake, and rolling-pin.....	F. C. Leyboldt.....	50, 732
Cutter, Cheese curd.....	I. M. Pyle.....	49, 631
Cutter, Curd.....	H. Keeney.....	50, 290
Cutter, Leather shoestring.....	C. Wadsworth.....	47, 340
Cutter, Meat.....	J. A. Safford.....	45, 744
Cutter, Meat.....	J. G. Perry.....	45, 788
Cutter, Meat.....	W. G. Bell.....	47, 875
Cutter, Meat.....	Le Roy S. Starrett.....	49, 762
Cutter, Meat.....	R. V. Jones.....	50, 984
Cutter, rule, square, blotter, and paper, Combination of.....	D. Bearly.....	50, 404
Cutter, Sod.....	A. H. Trego.....	45, 926
Cutter, Stalk, and seed sower, Combined.....	W. A. L. Kirk.....	49, 997
Cutter, Straw.....	B. A. Grant.....	45, 925
Cutter, Straw.....	J. C. Kennedy.....	45, 997
Cutter, Straw.....	C. R. Hewitt.....	46, 839
Cutter, Straw.....	J. R. Whittemore.....	48, 403
Cutter, Straw.....	E. F. Holloway.....	48, 597
Cutter, Straw.....	B. Spencer.....	48, 649
Cutter, Straw.....	J. Brockway.....	49, 190
Cutter, Straw.....	G. T. Wright.....	49, 478
Cutter, Straw.....	J. McMahon.....	49, 554
Cutter, Straw.....	W. D. Schooley.....	50, 366
Cutter, Straw.....	D. S. Kahler.....	51, 116
Cutter, Straw, and feed mixer, Combined.....	R. Leggett and R. Gittus.....	47, 386
Cutter, Tube sheet.....	E. F. Bishop.....	47, 983
Cutter, Vegetable.....	D. E. Rice and W. Evered.....	46, 002
Cutter, Vegetable.....	F. Hüllhorst.....	49, 499
Cutter, Vegetable.....	J. Caldwell.....	50, 679
Cutter stock.....	A. T. Bleyley.....	45, 742
Cutter for barrel heads.....	J. Pease.....	50, 677
Cutter for bread, meat, &c.....	W. H. Bennett.....	48, 014
Cutter bars for harvesting machines.....	D. Campbell.....	45, 879
Cutter for stone channelling machinery.....	G. G. Taylor.....	51, 273
Cutter for wood-turning lathes.....	G. J. Wardwell.....	49, 161
Cutter and corer, Apple.....	J. Shannon.....	50, 197
Cutting cornstalks on the ground.....	J. Wroten.....	48, 704
Cutting machine, Band.....	T. W. McDill.....	48, 280
Cutting stalks.....	W. U. Hoover.....	48, 312
Cutting stalks and stubble in fields preparatory to ploughing.....	J. B. Ryder.....	51, 507
Cutting tool, Screw-thread.....	G. W. Wilson.....	50, 808
Cutting wood gear.....	C. Dreher.....	49, 881
Cylinders, Carding, Cleaning.....	C. R. James.....	49, 679
Cylinders, Picking, of machines for disintegrating fibrous materials.....	A. A. Hawley.....	46, 294
Cylinders of tool-burring and similar machines.....	S. Boyden.....	49, 625
D.		
Dam, Coffier.....	A. Folsom.....	46, 098
Damper.....	N. R. Ramsey.....	48, 491
Damper.....	J. Knickerbocker.....	48, 695
Damper.....	W. J. Johnson.....	50, 133
Damper.....	A. E. Elmer.....	50, 569
Damper, Draught, and stove-pipe ventilator.....	G. G. Woffe.....	46, 414
Damper, Self-regulating.....	C. H. Davis.....	48, 291
Damper, Smoke-pipe.....	E. M. Gardner.....	47, 293
Damper, Stove.....	G. Asmus.....	50, 216
Damper, Stove-pipe.....	F. Mackwitz and W. Frankfurth.....	46, 007
Damper, Stove-pipe.....	J. L. Howard.....	46, 670
Damper, Stove-pipe.....	H. Kipe.....	47, 111

Invention or Discovery.	Name of Patentee.	No.
Damper, Stove-pipe	H. C. Brown	47, 923
Damper, Stove-pipe	J. Bradshaw and S. C. Wilson	48, 046
Damper, Stove-pipe	A. V. and A. F. Fletcher	48, 058
Damper, Stove-pipe	C. Kathan	48, 932
Damper, Stove-pipe	J. Fowler	49, 619
Damper, Stove-pipe	J. C. and A. B. Arlington	51, 409
Damper, Ventilating and check draught	J. A. Lawson	46, 249
Damper and ventilator	J. H. Littlefield	49, 899
Damper for violins	A. F. H. Braun	48, 648
Dancer, automatic	C. Chinnock	50, 452
Dead centre lifts	J. G. Gorman	46, 102
Decanter, Photographers'	E. W. Doty, E. A. and W. F. Stein	48, 664
Deflectors for photographic pictures	D. Shive	50, 284
Dental apparatus	W. H. Dibble	50, 461
Dentists, Plugging tool for, Self-feeding	M. Burchardt	50, 428
Dentists' pins, Heading	W. A. Duff and J. J. Griffith	46, 786
Dentures, Artificial	S. C. Taylor	50, 186
Deodorizing composition	A. Ranken	51, 216
Derrick, Hay	W. Minick	50, 150
Derrick, Portable	J. Greives	48, 808
Derricks and horse powers	D. Woodbury	45, 890
Desk	F. Baltz	47, 915
Desk, Folding	J. F. McNee	49, 428
Desk, School	W. Johnson	51, 727
Desk, School, and seat	J. P. Allen	46, 980
Desk and seat, School	W. Disbrow	47, 093
Desk and table	C. Baldwin	47, 378
Desk or table	W. Hemmer	48, 939
Desk or work table, Combined	J. Trevor	47, 058
Detectors, Low water	J. Yates	46, 173
Detectors, Low water	J. Cosfeldt	48, 158
Detectors, Low water	J. R. Supplee and R. K. Wright	51, 759
Detectors, Low water, for steam generators	D. C. Mead and C. Maggi	50, 660
Detergents, Manufacture of	S. Coburn	50, 336
Diagrams for testing the value of mutilated currency notes	L. Fox	49, 099
Diamonds, Glaziers', Setting and adjusting	M. Kleeman	47, 605
Dice, &c., Tool for making	C. B. Rogers	47, 571
Dice, Throwing	B. F. Bee	49, 700
Die, Roller	G. W. Wicks	48, 472
Die, Screw-cutting, Stock for holding	E. C. C. Kellogg	47, 898
Die, Screw-cutting, Stocks for holding	W. Pimlott	50, 731
Die stocks	J. Koberle	49, 687
Die stocks	W. and J. Holroyd	51, 048
Die for curving springs	A. Komp	50, 721
Die for cutting paper collars	G. K. Snow	51, 235
Die for cutting screw threads	B. S. Hill	47, 543
Dies for forging and shaping pistol frames	S. P. Legg	51, 327
Dies for furniture nails	W. H. Van Gieson	49, 808
Dies for making augers	E. N. Tracey	48, 633
Dies for making buttons	A. C. Sweetland	50, 185
Dies for making railroad-crossing points	H. Bains	51, 527
Dies for spike machines	S. Cameron	47, 928
Die and punch	W. K. Lewis	46, 681
Diggers, Rotary	H. Stanley	47, 996
Digging machine	C. H. Stratton	45, 877
Diseases, Treatment of, Applying heat and cold in the	J. Chapman	46, 535
Diseases, Treating, by condensed air	O. Stone	50, 641
Dish or cup, Batter	B. Wieland	49, 019
Dish washer	J. A. Hotchkiss and R. Eaves	48, 814
Distillates, Spirits and other, Measuring and testing	E. Payne	46, 058
Distilling	C. F. Frederici	48, 672
Distilling petroleum, &c.	E. Braggius	46, 633
Distilling and brewing, Cooling and condensing apparatus used in	D. E. Somes	46, 394
Distilling and evaporating apparatus	W. P. Wheeler	49, 328
Ditching machine	J. H. Snyder	47, 229
Ditching machine	N. Starbuck	49, 166
Ditching machine	A. W. Cox	49, 235
Ditching machine	W. H. Dalby	49, 239
Ditching machine	S. F. Jones	49, 276
Ditching machine	P. Lugenbell and J. S. Armstrong	51, 067
Dividers	S. A. Shurtleff	50, 173
Docks, Construction of	S. J. Seely	46, 146
Docks, Dry	J. Ryan	50, 390
Docks, Floating	E. Turner	47, 501
Docks, Lifting	Z. P. Leach	45, 724
Dolls, Arms for	C. F. Blakeslee	45, 691
Doll heads and other toys, Constructing	L. E. Sallee	46, 270
Doors, Elastic studs for	A. Eliners	45, 984
Doors, Furnace	J. Wickersham	51, 618
Doors, Furnace, for boilers	J. Penketh	46, 423
Doors, Sliding, of Railway cars	A. G. Safford	49, 308
Doors, Spring, Catch for	J. C. Plumer	46, 607
Doors, Weather strip for	I. F. and A. A. Lynch	50, 016

Invention or Discovery.	Name of Patentee.	No.
Doors, Weather strip for	G. H. Collins	51, 296
Door fastener	E. H. Crane	46, 451
Door fastener	G. W. Sayre	49, 656
Door knobs, Extension	W. T. Munger	48, 874
Door knobs, Fastening, to their shanks	M. V. Nobles	48, 024
Door knobs, Fastening, to their shanks	M. V. Nobles	48, 025
Door knobs, Rose for	M. V. Nobles	48, 023
Door knobs, Securing necks to	T. Kennedy	45, 836
Door mat	F. V. Noyes	49, 780
Door threshold	C. Loring	51, 066
Doors and windows, Rendering water-tight	W. C. Fuller	47, 368
Door and window fastener	H. Jordan	51, 059
Double-tree for carriages	J. Hoover	46, 904
Dough, Aerating	E. Fitzgerald	45, 706
Dough, Kneading	G. R. Baker	50, 322
Dough, raising	T. Stockton	47, 050
Dough kneader	T. C. King	48, 979
Draught equalizer, Three-horse	E. J. Toof	51, 632
Drag, roller, and seeding machine, Combined	W. H. Hartman and S. Sheller	45, 825
Drag and seeding machine roller, Combined	W. H. Hartman	48, 063
Draining machine, Centrifugal	A. N. Glass and H. W. Bartol	47, 714
Drain tiles	J. D. Evans and T. J. Smedley	50, 097
Drawers	J. Ware	50, 308
Drawers, Coffee and tea	J. O. Shriner	49, 929
Drawer fastening	J. Serrill	51, 625
Draw-heads, Frames of, for railroad cars, Bending and punching	P. L. Weimer	50, 755
Draw-head plates, Bending and punching	P. L. Weimer	50, 756
Drawing-board, Symmetrical	C. D. Hillman	50, 583
Drawing frame rolls	J. M. Stone	47, 667
Dredging machine for harbors and rivers	A. J. Gove	46, 463
Dresses, Head, Waterfall, for ladies'	P. Walter	46, 961
Dresses, Ladies', Finding waist and chest measurement of	M. M. Turner	46, 409
Dress facing	J. A. Mackie	45, 840
Dress protector, Ladies'	T. D. Day	46, 218
Drills	C. L. Noé	46, 815
Drills	A. Shiland	46, 949
Drills	R. G. Wells	48, 609
Drills	L. G. Marshall	48, 819
Drills	L. G. Marshall	48, 872
Drills	J. M. May	49, 129
Drills	H. Loftie and E. Hinman	51, 065
Drills, Boring	D. R. Erdmann	47, 001
Drills, Expanding	F. Gleason	48, 548
Drill, Grain	J. W. H. Doubler	46, 523
Drills, Grain	B. Regan	46, 821
Drills, Grain	J. Ingals	48, 069
Drills, Grain	J. B. Amos	48, 145
Drills, Grain	W. P. Penn, J. Geiss, and J. Brosius	48, 432
Drills, Grain	J. D. Jones	49, 117
Drills, Grain	J. D. Jones	49, 882
Drills, Grain	J. D. Jones	50, 134
Drills, Grain	J. H. Thomas and P. P. Mast	50, 545
Drills, Grain	J. Davis	50, 914
Drills, Grain	G. W. Farley	51, 707
Drills, Grain, Adjustable drag bar for	J. D. Jones	49, 883
Drills, Grain, and cultivator, Combined	E. Badlam	50, 438
Drills, Grain, Drag bars for	J. H. Thomas and P. P. Mast	48, 112
Drills, Grain, Drag bar and teeth for	J. D. Jones	50, 135
Drills, Mounting	H. Haupt	47, 541
Drills, Oil	L. H. Bowman	49, 704
Drills, Oil well	E. Baker	49, 065
Drills, Pneumatic	H. Haupt	46, 668
Drills, Ratchet	E. H. Ashcroft	46, 981
Drills, Reservoir, for tube wells	C. Houghton and R. S. Lewis	51, 051
Drills, Rock	T. J. Lovegrove	46, 757
Drills, Rock	T. J. Lovegrove	47, 601
Drills, Rock	J. C. Dickey	47, 805
Drills, Rock	J. Moulton	47, 850
Drills, Rock	J. Y. Smith	47, 870
Drills, Rock	G. Mulhaupt	48, 301
Drills, Rock	J. M. May	48, 823
Drills, Rock	J. C. Dickey	48, 914
Drills, Rock	C. W. Johnson	49, 034
Drills, Rock	O. B. Leatham	49, 281
Drills, Rock	J. M. May	50, 020
Drills, Rock	E. J. Graham	50, 576
Drills, Rock	G. W. Smith and C. F. Herris	51, 230
Drills, Rock	T. Mayhew	51, 336
Drills, Rock	H. B. Williams and J. C. Wilson	51, 376
Drills, Rock	J. M. Linscott	51, 598
Drills, Rock	W. S. Fickett	47, 290
Drills, Rock	J. D. Butler	47, 390
Drills, Seed	G. M. Murphey	47, 153

Invention or Discovery.	Name of Patentee.	No.
Drills, Seed.....	A. H. Wagner.....	48, 117
Drills, Seed.....	W. B. Porter.....	48, 433
Drills, tubes, &c., Extractor of, from oil wells.....	W. R. Hinsdale.....	49, 628
Drills, Well.....	A. Crandall.....	48, 524
Drills, Well.....	L. G. Peck.....	48, 835
Drills, Well.....	J. Hofner.....	49, 587
Drills, Wheat.....	G. King.....	47, 024
Drills, Wheat.....	J. B. Crowell.....	48, 262
Drills, Wheat.....	W. Rice.....	48, 441
Drills, Wheat.....	J. F. Keller.....	50, 140
Drill bit.....	W. W. Grier and R. H. Boyd.....	47, 812
Drill gauge.....	N. C. Wells.....	51, 248
Drill jar.....	C. A. Read.....	51, 217
Drill rod attachment.....	R. S. Torrey.....	50, 857
Drill for artesian wells.....	J. Shaw.....	49, 798
Drill for boring rocks, &c.....	W. Bickel.....	48, 785
Drill for boring wells.....	J. Sheffield.....	45, 869
Drill for boring wells.....	D. H. Wisewell and G. W. Shaw.....	48, 006
Drill for boring wells.....	C. Bates.....	48, 892
Drill for boring wells.....	O. B. Latham.....	49, 123
Drill for boring wells.....	C. F. Chase.....	49, 717
Drill for wells.....	J. H. S. Tuck.....	49, 177
Drill from wells, Extracting.....	J. Beoger.....	48, 615
Drill for oil and other wells.....	W. G. Oliver.....	48, 026
Drill and reamer for oil and other wells.....	J. Burnes.....	51, 138
Drilling, Coupling tool for.....	J. and R. Moore.....	47, 031
Drilling machines.....	W. Lyon.....	46, 123
Drilling machine.....	J. S. Lauback.....	46, 478
Drilling machine.....	J. Moulton.....	46, 813
Drilling machine.....	J. Button.....	50, 985
Drilling machine.....	A. Hatch.....	51, 113
Drilling machine.....	A. P. Jackson and L. Thompson.....	51, 189
Drilling machine, Rock.....	R. Hood.....	50, 001
Drilling machinery.....	W. S. and S. B. Wells.....	48, 467
Drilling and boring machine.....	J. Haupt.....	47, 819
Drum, Stove-pipe.....	J. B. Hyzer.....	47, 833
Drum, Stove-pipe.....	T. Whitson.....	47, 887
Drum, Stove-pipe.....	G. D. Greenleaf.....	47, 945
Drum, Stove-pipe.....	W. Kroeger.....	48, 784
Drum, Stove-pipe.....	J. C. Palne.....	48, 716
Drying apparatus.....	D. K. Boswell.....	50, 895
Drying straw boards.....	W. O. H. Severson.....	50, 380
Dumb bells.....	D. P. Butler.....	48, 514
Dumb bells, Graduated.....	G. B. Winship.....	46, 413
Duster for brick machines.....	C. Chambers, jr.....	45, 974
Dust-pan and brush.....	C. H. Parker and G. Burnham.....	48, 582
Dyes and colors, Preparation and manufacture of.....	G. H. Reed.....	50, 495
Dyers, Coloring matter for, Producing.....	J. Eberhardt.....	46, 888
Dyeing and printing, Aniline colors for, Preparing.....	A. S. L. Leonhardt.....	49, 958
E.		
Ear-spoon, knife, and tweezer, Combined.....	B. C. English.....	50, 106
Earthenware, Making.....	C. W. Saladee.....	47, 043
Eave troughs.....	F. J. Emery.....	46, 093
Eave-trough brackets.....	W. Yapp.....	49, 466
Eccentric, Adjustable.....	D. F. Walker.....	46, 737
Eccentric adjustment.....	J. M. Stone.....	46, 278
Eggs, Desiccating.....	C. A. Lamont.....	50, 421
Eggs, Desiccating.....	T. H. Quick.....	51, 084
Eggs, Packing, Box for.....	E. M. Coombs.....	50, 341
Eggs, Preserving.....	W. Hansford.....	47, 202
Eggs, Preserving.....	C. A. Lamont.....	51, 268
Eggs, Preserving.....	R. S. Rhodes and E. Whyte.....	51, 480
Egg beater.....	M. G. Crane.....	48, 525
Egg beater.....	H. Tilden.....	49, 176
Egg beater.....	W. B. Smith.....	51, 758
Egg boiler.....	A. Sharlow.....	47, 228
Egg boiler.....	F. Ashley.....	49, 062
Egg cooker.....	W. Loucks.....	48, 190
Egg holder and packer.....	O. T. Bedell.....	48, 507
Ejectors, Fluid.....	R. McGrath.....	47, 654
Ejectors, Liquid.....	A. Brear.....	49, 602
Ejectors, Oil.....	H. Carl.....	46, 824
Ejectors, Oil.....	G. M. Mowbray.....	46, 925
Ejectors, Oil.....	F. S. Pease.....	46, 931
Ejectors, Oil.....	W. R. Greenleaf.....	47, 011
Ejectors, Oil.....	F. S. Pease.....	47, 034
Ejectors, Oil.....	G. L. Witsil and E. Burke.....	47, 148
Ejectors, Oil.....	L. W. Turrell, S. Stanton, and L. C. Ward.....	47, 174
Ejectors, Oil.....	S. P. Schoonmaker.....	47, 226
Ejectors, Oil.....	E. Crooker.....	47, 399
Ejectors, Oil.....	G. E. Mills.....	47, 444

Invention or Discovery.	Name of Patentee.	No.
Ejectors, Oil.....	A. Brear.....	47, 793
Ejectors, Oil.....	J. Y. Smith.....	47, 871
Ejectors, Oil.....	J. Y. Smith.....	48, 106
Ejectors, Oil.....	W. R. Greenleaf.....	48, 170
Ejectors, Oil.....	W. W. Hubbell.....	50, 710
Ejectors, Oil.....	R. Boeklen.....	51, 008
Ejectors, Oil.....	N. S. Chappell.....	49, 603
Ejectors for deep wells.....	J. Blackie.....	50, 893
Ejector for oil wells.....	G. M. Mowbray.....	45, 849
Ejector for oil wells.....	G. M. Mowbray.....	46, 485
Ejector for steam boilers.....	S. Maltby and C. Osborn.....	50, 205
Ejectors for steam-boiler furnaces.....	J. N. Snowden and H. Wilkins.....	48, 218
Electricity, Heating oil wells by.....	G. T. Parry and W. S. Warner.....	48, 584
Elevators.....	O. B. Nimbs.....	48, 851
Elevators.....	W. Sawyer.....	50, 778
Elevators.....	J. H. Jenkins.....	51, 190
Elevator, Hay.....	E. J. Toof.....	47, 671
Elevator, Hay.....	W. F. Totton.....	49, 805
Elevator, Hydraulic.....	D. Bickford.....	51, 129
Elevators, Water.....	A. Tarbox.....	46, 403
Elevator, Water.....	J. H. Best.....	49, 217
Elevators, Water.....	P. Perrine.....	49, 914
Elevators, Water.....	H. H. May.....	50, 944
Elevators, Well, Deep.....	T. Byrne.....	50, 986
Elevator and excavator, Horse-power.....	S. T. Bishop and A. Stevely.....	49, 965
Elevator and excavator, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 966
Elevator and excavator, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 967
Elevator and excavator, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 968
Embroidery, Imitation of.....	B. Muller.....	51, 668
Enamel.....	T. L. Oest.....	48, 500
Enamels, paints, &c., Composition for.....	M. W. Brown.....	49, 708
Engines, Air.....	D. Bickford.....	48, 043
Engines, Air.....	S. Wilcox, jr.....	50, 061
Engines, Air, Hot.....	M. G. Crane.....	46, 084
Engines, Air, Hot.....	C. W. Baldwin.....	46, 320
Engines, Air, Hot.....	H. Messer.....	46, 689
Engines, Air, Hot.....	S. Wilcox, jr.....	47, 759
Engines, Air, Hot.....	C. W. Baldwin.....	48, 639
Engines, Air, Hot.....	S. Wilcox, S. Wilcox, jr.....	50, 062
Engines, Air, Hot.....	C. Stevens.....	50, 506
Engines, Air, Hot.....	H. Kilbourne.....	50, 875
Engines, Carbonic acid.....	N. H. Barbour.....	46, 769
Engines, Carding.....	E. Leigh.....	50, 211
Engines, Carding.....	H. L. Moulton.....	50, 377
Engines, Carding.....	H. Marsden and T. Blamires.....	51, 333
Engines, Carding, Doffing apparatus for.....	R. Lord and L. Hutton.....	46, 120
Engines, Carding, Waste saving attachment to.....	A. A. Bennett.....	47, 274
Engines, Carding, picking, and other similar, Means of feeding wool and other fibrous material to.....	S. R. Parkhurst.....	47, 976
Engines, Cylinder, Revolving.....	J. S. Foster.....	51, 166
Engines, Fire.....	J. N. Dennison.....	46, 219
Engines, Gas.....	P. Hugon.....	49, 346
Engines, Hydraulic, and meter.....	J. S. Barden.....	50, 651
Engines, Hydro-pneumatic.....	J. A. Huss.....	49, 410
Engines, Hydrostatic.....	J. Hansbrow and B. B. Redding.....	46, 795
Engines, Oscillating.....	W. H. King.....	48, 563
Engines, Paper-mill, Bedplate for.....	O. Morse.....	47, 849
Engines, Piston, Vibrating.....	J. B. Root.....	47, 459
Engines, Rag, of paper-making machinery.....	T. Lindsey.....	47, 739
Engines, Rotary.....	E. B. Adams, R. P. Trimble, and H. N. Adams.....	46, 201
Engines, Rotary.....	W. Aven and F. Bradley.....	46, 436
Engines, Rotary.....	J. R. Ellis.....	46, 457
Engines, Rotary.....	T. Merriam and J. Cushing.....	48, 577
Engines, Rotary.....	D. Bickford.....	49, 070
Engines, Rotary.....	H. Durre.....	49, 391
Engines, Rotary.....	J. H. Warren.....	49, 594
Engines, Rotary.....	S. M. Davis.....	49, 610
Engines, Rotary.....	J. T. Warren.....	50, 666
Engines, Rotary.....	E. Matteson.....	51, 335
Engines, Screw, Releasing.....	A. Kieffer.....	48, 339
Engines, Spring and weight piston, and stamping machine.....	E. F. and J. McFarland.....	51, 737
Engines, Steam.....	D. Sexton.....	45, 756
Engines, Steam.....	T. Welham.....	46, 165
Engines, Steam.....	W. C. Hicks.....	46, 470
Engines, Steam.....	D. H. Paullins.....	46, 582
Engines, Steam.....	W. Huston.....	46, 672
Engines, Steam.....	C. W. Isbell.....	46, 800
Engines, Steam.....	J. Baird.....	47, 377
Engines, Steam.....	H. Johnson.....	47, 424
Engines, Steam.....	E. Danford.....	47, 621
Engines, Steam.....	W. S. Phelps.....	47, 748
Engines, Steam.....	R. H. Davies.....	47, 766
Engines, Steam.....	G. B. Brayton.....	47, 792

Invention or Discovery.	Name of Patentee.	No.
Engines, Steam.....	R. Wyatt.....	48, 139
Engines, Steam.....	O. M. Stillman.....	48, 321
Engines, Steam.....	D. Demming and D. A. Porter.....	48, 529
Engines, Steam.....	W. Golding.....	48, 549
Engines, Steam.....	W. M. Storm.....	48, 777
Engines, Steam.....	G. J. Washburn.....	49, 809
Engines, Steam.....	G. Yellott.....	50, 983
Engines, Steam.....	L. Towne.....	51, 496
Engines, Steam.....	T. A. DeBlois.....	51, 565
Engines, Steam, Automatic stop motion for.....	J. Jackson, jr.....	47, 357
Engines, Steam, Automatic stop motion for.....	J. Jackson, jr.....	47, 358
Engines, Steam, Automatic stop motion for.....	J. Jackson, jr.....	47, 359
Engines, Steam, Automatic stop motion for.....	A. Nadow.....	48, 426
Engines, Steam, Automatic stop motion for.....	T. I. Bailey.....	51, 412
Engines, Steam, Cut-offs for.....	J. H. Paine.....	46, 020
Engines, Steam, Oscillating.....	D. Nation and T. B. Hall.....	49, 293
Engines, Steam, Portable.....	W. Wright.....	49, 334
Engines, Steam, Rotary.....	S. Harris.....	47, 636
Engines, Steam, Rotary.....	J. W. Simonton and O. T. Struble.....	47, 751
Engines, Steam, Rotary.....	H. T. Briggs.....	48, 362
Engines, Steam, Rotary.....	H. T. Briggs.....	48, 362
Engines, Steam, Rotary.....	G. Westinghouse.....	50, 759
Engines, Steam, Rotary.....	J. Torrance.....	51, 122
Engines, Steam, Rotary.....	M. Fletcher.....	51, 165
Engines, Steam, Rotary.....	G. A. Lamb.....	51, 389
Engines, Steam, Stuffing boxes for.....	V. Duterne.....	50, 541
Engines, Steam, Valve gear for.....	C. E. Gage.....	47, 492
Engines, Steam, Valve gear for.....	W. H. Stanton and A. D. Spencer.....	50, 966
Engines, Steam, Valve gear for, Cut-off.....	H. O. Perry.....	46, 932
Engines, Traction, for common roads.....	J. Frye.....	49, 746
Engine head lights.....	S. M. Davies.....	46, 998
Engine for operating rock drills.....	J. D. Butler.....	47, 390
Engines for preparing paper stock.....	J. G. Fuller.....	46, 893
Engraving, Bank-note.....	W. L. Ormsby.....	47, 744
Engraving, Line, Producing, Heliographic and photographic, spectrum for.....	F. Von Egloffstein.....	51, 103
Engraving metallic plates.....	W. L. Ormsby.....	47, 745
Envelope.....	E. L. Barrett.....	51, 549
Envelope, Letter.....	T. S. Lambert.....	46, 911
Envelope, Letter.....	J. G. Arnold.....	47, 508
Envelope, Paper collar packing.....	G. K. Snow.....	48, 848
Envelope and letter sheet, Combination of.....	C. Rowland.....	51, 623
Epilobium, Fibres of, manufacture from the.....	R. B. Miller.....	46, 922
Eraser.....	A. G. Shaver.....	46, 032
Eraser, Mark, and pencil-point protector.....	J. B. Hodgskin.....	46, 358
Eraser and burnisher.....	A. G. Shaver.....	49, 538
Eraser and burnisher.....	A. G. Shaver.....	49, 539
Eraser and pencil.....	W. R. Evans and L. D. Benner.....	47, 406
Escapements for timepiece.....	D. J. Mozart.....	46, 576
Evaporating and distilling apparatus.....	W. P. Wheeler.....	49, 328
Evaporator.....	W. Canning.....	47, 795
Evaporator.....	F. A. Lord.....	47, 966
Evaporator.....	F. M. Love.....	48, 628
Evaporator.....	T. and J. M. Scantlin.....	48, 982
Evaporator.....	I. H. Palmer.....	48, 990
Evaporator.....	J. Bogue.....	49, 851
Evaporator.....	J. E. Moeller.....	51, 206
Evaporator.....	J. C. Bell.....	51, 683
Evaporator, Cane-juice.....	F. Groves.....	46, 969
Evaporator, Cane-juice.....	W. Edgerton.....	49, 392
Evaporator, Sorghum.....	J. H. Merrill.....	47, 970
Evaporator, Sorghum.....	S. Heaton.....	48, 397
Evaporator, Sorghum.....	J. Kindley.....	49, 534
Evaporator, Sorghum.....	R. Bullard.....	49, 974
Evaporator, Sorghum.....	E. R. Skinner.....	50, 424
Evaporator, Sorghum.....	L. M. Myers.....	50, 726
Evaporators, Sugar.....	T. C. Bartle.....	49, 363
Evaporator for saccharine and other liquids.....	J. E. Morse.....	46, 260
Evaporator and sirup boiler.....	L. Thomas.....	50, 644
Excavators.....	J. Hodges.....	47, 908
Excavators.....	J. C. Osgood.....	48, 581
Excavators.....	H. W. Farley.....	48, 669
Excavators and elevators, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 965
Excavators and elevators, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 966
Excavators and elevators, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 967
Excavators and elevators, Horse-power.....	S. T. Bishop and A. Stevely.....	45, 968
Exercising machine.....	F. P. Thorpe.....	47, 399
Extracts, desiccated and vegetable.....	W. J. Rand.....	48, 719

Extracts, Obtaining.....	B. P. Martin.....	46, 809
Extracts, Obtaining, from vegetables, &c.....	J. Chilcott.....	47, 393
Extracts from tan bark.....	L. W. Pingree.....	50, 626
Extractor, Sediment, for steam boilers.....	E. Thayer.....	47, 332

Invention or Discovery.	Name of Patentee.	No.
Extractor, Stump and grub	I. VanKerson	48, 748
Extractor of tubes, drills, &c., from oil wells	W. R. Hinsdale	49, 628
Eye-water	N. Pike	46, 494
Eyes and books	J. P. Culver	45, 979
Eyeletting machine	H. S. Lipman	45, 727
F.		
Fabrics, Elastic	H. Hyves	46, 674
Fabrics, Felted	E. Waite	46, 837
Fabrics, Felted	E. D. McCracken	48, 131
Fabrics, Felted	E. Waite	48, 353
Fabrics, Netted or laced	H. A. Oesterle	51, 744
Fabrics, Water-proof	T. Crossly	48, 015
Fabrics, Water-proof	T. Crossly	48, 762
Fabrics, Weaving, with button-holes therein	J. Conner	47, 151
Fabrics, Weaving three-ply Jacquard	J. S. Ferguson	46, 892
Fabrics for hats, bonnets, &c.	H. Loevenberg	46, 568
Fabrics for hats, Water-proof	W. E. Mahon	49, 775
Fabrics for shirt lining and binding	C. Spannagel	50, 317
Fagots, Construction of	F. W. Webb	47, 077
Fans	B. M. Smith	51, 228
Fans, Rotary	G. Leach	47, 538
Fan blower	R. Porter	45, 749
Fan blowers	C. G. Sargent	48, 593
Fan blowers	W. Kendrick	51, 321
Fan blowers	M. Smith	48, 986
Farming implements, Attaching teams to	H. A. Cook	50, 908
Faucets	R. Murray	45, 949
Faucets	H. Strater, jr.	46, 726
Faucets	H. Strater, jr.	46, 727
Faucets	H. Strater, jr.	46, 728
Faucets	J. N. Smith	46, 862
Faucets	J. Matthews, jr.	48, 421
Faucets	G. G. Percival	48, 995
Faucets	N. Jenkins	49, 527
Faucets, Beer	J. Miller	47, 442
Faucets, Beer	A. Hallowell	48, 273
Faucets, Beer	L. Poh	48, 588
Faucets, Measuring	T. M. Girt	48, 296
Faucets, Measuring	J. N. Smith	48, 318
Faucets, Measuring	S. H. Wheeler	48, 778
Faucet measures, Graduating	G. H. Henkel	48, 556
Faucets, Stop valves for	W. Krull	49, 894
Faucet and funnel, Combined	H. Mitchell	46, 690
Faucets for oil and other liquids	J. D. Frary	46, 555
Faucets and valves, Grinding	T. Shaw	48, 216
Feather renovator	W. McArthur	48, 762
Feed-mixer and straw-cutter, Combined	E. F. Bishop	47, 386
Feed regulating mechanism for hoppers	J. S. Bodge	48, 646
Feed-water apparatus	J. G. Washburn	49, 941
Feed-water apparatus	G. A. Riedell	50, 033
Felt, Drying, for paper-making machines	S. W. Baker	50, 323
Fence	M. Brown and O. J. Shannon	46, 541
Fence	E. Hollinger	46, 799
Fence	J. K. and C. B. Clark	46, 881
Fence	O. H. Woodworth	46, 964
Fence	D. Harvey	47, 203
Fence	W. Nevins	48, 086
Fence	D. L. Pettigrew	48, 774
Fence	S. Stanbro	49, 313
Fence	W. D. Woodruff	49, 820
Fence, Field	T. R. Byrnes	51, 691
Fence, Field, and gate, Combined	P. W. Kuiskern	46, 052
Fence, Iron railing for	J. C. Lee	50, 605
Fence, Portable	S. Crowell	47, 801
Fence, Portable	J. M. May and E. B. Godfrey	48, 701
Fence, Wire	S. Bryan	50, 446
Fence post, Boring	J. W. Norcross	45, 852
Fender for horse's leg	J. Agnew	51, 676
Ferrules for boiler tubes	S. Rossman	48, 097
Fertilizer	G. W. Durall	49, 987
Fertilizer	J. D. Whelpley	49, 943
Fertilizers, Distributing	O. Lugo	50, 940
Fertilizers, Distributing	J. M. Wiltse	46, 515
Fertilizers, Manufacture of	J. H. Thomas and P. P. Mast	47, 138
Fertilizers to growing plants, Distributing	F. Klett	49, 891
Fetter for animal	D. C. Colby	48, 155
Fibres, Vegetable, Disintegrating	M. E. Burlingame	49, 081
Fibres, Vegetable, Removing mineral, gummy, and resinous substances from	C. Heaton	49, 106
Fibres, Vegetable, and cloth for bleaching, Preparation of	A. Mencei	47, 068
Fibres, Vegetable, Separating gummy and silicious matter from	G. W. Billings	46, 774
	C. Heaton	47, 301

Invention or Discovery.	Name of Patentee.	No.
Fibres, Vegetable, for the manufacture of paper pulp.....	J. W. Dixon	51, 706
Fibres of epilobium, Manufacture from the.....	R. B. Miller	46, 922
Fibrous material, Disintegrating, Picking cylinders of machines for.....	S. Boyden	46, 294
Fibrous material for spinning, &c., Rolls for preparing	D. Read	48, 134
Fibrous plants from pulpy matter, Separating.....	J. R. Beckwith	51, 413
Fibrous and porous materials, Impregnating	S. Gwynn	46, 466
Field marker for planting	W. Goltry	48, 551
Fifes and flutes	A. H. Stratton	47, 582
Files, Cutting.....	A. Weed	46, 865
Files, Grinding	I. H. Spencer	49, 042
File, Letter.....	J. W. Hauxhurst	50, 580
File, Letter or invoice	R. Boeklen	50, 652
File, Newspaper.....	W. Burnet	46, 072
File, Paper and letter.....	H. Riggs	51, 520
Files, saws, &c., Tempering	J. Small	49, 451
File blanks, Forging	W. S. Nicholson	45, 850
File-cutting machine	J. D. Croker	46, 545
File-cutting machine	M. G. Crane	46, 720
File-cutting machine	J. K. Barker	49, 214
File-cutting machine	J. Jervis	50, 595
File-cutting machine	M. D. Whipple	50, 647
File holder	W. C. McGill	51, 470
Filings, Metallic, Separating.....	J. Johnson	46, 005
Filters	C. Clemmshaw	46, 079
Filters	E. Andrews	47, 074
Filters	M. A. Espirat and E. Sause	47, 251
Filters	T. Simmons	47, 261
Filters	H. H. Tilden	49, 013
Filters, Water	N. Downes	46, 646
Filters for artesian wells	J. Clary and E. B. Forrey	50, 686
Filter and cooler, Combined	L. Scharff	51, 485
Filter and cooler	W. P. Dickinson	51, 703
Filter for oils	P. Hall	48, 172
Fire alarm	C. Dion	49, 686
Fire annihilator.....	H. Baragwanath and M. Van Visker	51, 284
Fire-arms, Ball screw for.....	A. D. Wilzlesben	46, 220
Fire-arms, Bayonets to, Attaching	H. Berden	45, 901
Fire-arms, Breech-loading.....	F. Clark	45, 701
Fire-arms, Breech-loading.....	J. Rider	45, 797
Fire-arms, Breech-loading.....	C. G. Saez	45, 801
Fire-arms, Breech-loading.....	H. Berden	45, 899
Fire-arms, Breech-loading.....	I. M. Millbank	46, 125
Fire-arms, Breech-loading.....	J. A. Miller	46, 259
Fire-arms, Breech-loading.....	J. Rider	46, 532
Fire-arms, Breech-loading.....	F. W. Howe	46, 671
Fire-arms, Breech-loading.....	I. Sutvan	46, 866
Fire-arms, Breech-loading.....	D. Williamson	46, 977
Fire-arms, Breech-loading.....	J. W. Cochran	47, 088
Fire-arms, Breech-loading.....	C. Chabot	47, 163
Fire-arms, Breech-loading.....	A. M. White	47, 350
Fire-arms, Breech-loading.....	W. H. Elliot	47, 372
Fire-arms, Breech-loading.....	J. W. Cochran	47, 396
Fire-arms, Breech-loading.....	C. E. Snieder	47, 755
Fire-arms, Breech-loading.....	W. H. Elliot	47, 809
Fire-arms, Breech-loading.....	W. H. and G. W. Miller	47, 902
Fire-arms, Breech-loading.....	B. F. Joslyn	48, 073
Fire-arms, Breech-loading.....	W. Morgenstern	48, 133
Fire-arms, Breech-loading.....	B. F. Joslyn	48, 288
Fire-arms, Breech-loading.....	E. Maynard	48, 423
Fire-arms, Breech-loading.....	M. L. M. Descoutures	49, 057
Fire-arms, Breech-loading.....	E. Maynard	49, 130
Fire-arms, Breech-loading.....	W. F. Wilson and H. Flather	49, 463
Fire-arms, Breech-loading.....	E. Allen	49, 491
Fire-arms, Breech-loading.....	L. W. Broadwell	49, 583
Fire-arms, Breech-loading.....	C. Chabot	49, 718
Fire-arms, Breech-loading.....	J. D. Dougall	49, 844
Fire-arms, Breech-loading.....	E. S. Allin	49, 950
Fire-arms, Breech-loading.....	T. L. Sturtevant	50, 045
Fire-arms, Breech-loading.....	C. Howard	50, 125
Fire-arms, Breech-loading.....	N. S. Clement	50, 334
Fire-arms, Breech-loading.....	C. Howard	50, 358
Fire-arms, Breech-loading.....	W. Richards	50, 432
Fire-arms, Breech-loading.....	J. Stillman	50, 507
Fire-arms, Breech-loading.....	J. V. Der Poppenburg	50, 670
Fire-arms, Breech-loading.....	H. F. Wheeler	50, 760
Fire-arms, Breech-loading.....	F. B. Prindle	51, 213
Fire-arms, Breech-loading.....	F. Schopp	51, 225
Fire-arms, Breech-loading.....	W. Tibballs	51, 243
Fire-arms, Breech-loading.....	J. Davis	51, 258
Fire-arms, Breech-loading.....	W. H. and G. Miller	51, 739
Fire-arms, Breech-loading, Cartridge retractor for.....	F. Beals	46, 207
Fire-arms, Breech-loading, Cartridge retractor for.....	E. Allen	46, 617

Invention or Discovery.	Name of Patentee.	No.
Fire-arms, Breech-loading, Cartridge retractor for.....	G. P. and G. Foster	49, 994
Fire-arms, Breech-loading, Magazine	H. F. Wheeler	46, 286
Fire-arms, Breech-loading, Rifling	H. Berdan	45, 898
Fire-arms, Cartridge retractor for many-chambered.....	W. C. Dodge	45, 912
Fire-arms, Converting muzzle into breech loading	C. E. Snelder	46, 054
Fire-arms, Hammer of. Safety guard for the	H. E. Gibbon	46, 100
Fire-arms, Implement for detaching and replacing the parts of.....	A. Grillet	47, 715
Fire-arms, Magazine	V. Fogerty	46, 459
Fire-arms, Magazine	E. Stabler	46, 828
Fire-arms, Magazine	B. F. Parkinson	48, 201
Fire-arms, Magazine	G. W. Hughes and J. G. Pusey	49, 409
Fire-arms, Magazine	J. Gray	48, 622
Fire-arms, Many-chambered	W. H. Elliot	50, 232
Fire-arms, Many-barrelled	W. H. Elliot	51, 440
Fire-arms, Percussion-cap holder for	R. S. Pickett	47, 127
Fire-arms, Rear sight base for	F. W. Howe	46, 000
Fire-arms, Revolving	W. C. Dodge	45, 983
Fire-arms, Revolving	R. H. Plass	46, 023
Fire-arms, Revolving	W. H. Elliot	46, 235
Fire-arms, Revolving	B. F. Joslyn	46, 243
Fire-arms, Revolving	P. Haughian	46, 562
Fire-arms, Revolving	C. E. Snelder	46, 612
Fire-arms, Revolving	A. Guerriero	47, 252
Fire-arms, Revolving, Cylinder pin of	W. H. Elliot	47, 707
Fire-arms, Revolving	G. H. Gardner	47, 712
Fire-arms, Revolving	J. H. Vickers	47, 775
Fire-arms, Revolving	B. F. Joslyn	48, 287
Fire-arms, Revolving	L. C. Rodier	48, 775
Fire-arms, Revolving	S. Crispin	50, 224
Fire-arms, Revolving	H. Smith and D. B. Wesson	51, 092
Fire-arms, Revolving	W. Mason	51, 117
Fire-arms, Revolving	J. Rider	51, 269
Fire-arms, Revolving	E. T. Starr	51, 628
Fire-arms, Revolving	G. C. Bunsen	51, 690
Fire-arms, Revolving	J. Reid	51, 752
Fire-arms, Revolving, Rammer for	F. D. Newbury	46, 131
Fire-arms, Rifling	A. Frauth	50, 433
Fire-arms, Self-loading	C. M. Spencer	45, 952
Fire-arms, Self-loading, or magazine	W. Fitzgerald	45, 919
Fire blank	H. H. Baker	45, 956
Fire-chamber cleaner	G. R. Moore	45, 933
Fire escape	R. Wyatt	48, 333
Fire escape	C. J. and E. W. Jones	50, 596
Fire-kindling apparatus	J. Smith	50, 503
Fire machines	C. L. Crowell	49, 387
Fireplace	W. H. James	47, 423
Fireplace	M. D. Wellman and J. Old	48, 752
Fireplace, Movable, with gridiron attachment	J. W. Wetmore	47, 176
Fire plugs	J. Fricker	50, 235
Fire pots for stoves, &c.	W. Ennis	47, 895
Fire pots for stoves, furnaces, &c.	P. P. Stewart	47, 049
Fire-proof composition	N. E. Blake	47, 275
Fire-shrinking machine	J. A. Lloyd	46, 118
Fire-shrinking machine	M. Scott	50, 171
Fire-sprinkling machine	J. M. Kellogg	50, 716
Fire and steam heating extinguishing apparatus	C. S. Brown	46, 328
Fish, Curing and drying	B. Robinson	48, 723
Fish decoy	I. B. Quinby	51, 120
Fishing-line sinkers	E. F. Decker	46, 453
Fish, meat, fruit, &c., Preserving	J. G. Staunton	45, 765
Flask	W. T. Fry	51, 303
Flask pin	B. B. Whaley	47, 059
Flax, Cleaning, drying, and cutting	E. Phillips	47, 604
Flax, &c., Gathering and loading	G. W. Hatch	48, 064
Flax, hemp, &c., Filures of. Separating	J. B. Fuller and J. P. Upham	47, 539
Flax, hemp, jute, grass, &c., Treating	S. M. Allen	48, 782
Flax, hemp, &c., for the manufacture of paper pulp, Treating	M. A. Cushing	50, 419
Flax, hemp, &c., Preparing for spinning	J. B. Fuller and J. P. Upham	47, 538
Flax, Preparing	J. B. Fuller	51, 652
Flax, Pulling	A. Burchard	46, 857
Flax-pulling machine	J. Silvers	48, 731
Flax, Separating	C. S. Davis	47, 190
Fleece folders	C. W. Rudgers	50, 040
Floats, Shoemakers'	J. W. Foard	48, 544
Flood gate, Revolving	J. DuBois	45, 913
Floor cloths	C. L. Lawrence	49, 537
Floor covering	A. H. Piatt	45, 937
Flour, Bolting	J. E. Madigan	46, 919
Flour bolts	F. S. Thayer	47, 233
Flour bolts	S. Hefebower	48, 684
Flour bolts	J. Beall and L. K. Shaffer	49, 365
Flour bolts	J. E. Huston	49, 629
Flour bolts	S. Lewis	50, 371
Flour bolts	J. Brown	51, 548

Invention or Discovery.	Name of Patentee.	No.
Flour packer	I. Cook	49, 859
Flour sacks	J. M. Hurd	51, 722
Flour and meal for transportation, Preparing	E. B. Larcher	48, 697
Flowers, Natural, Preserving and restoring	A. J. Knox	46, 247
Flue cleaners	N. W. Wheeler	51, 249
Fluid, Printing	E. Whitefield	48, 471
Fluid, Writing	H. C. Baildon	49, 843
Fluid ejector	J. Wood	48, 861
Fluid extracts, Concentrated	N. S. Thomas	46, 156
Flutes and fifes	A. H. Stratton	47, 582
Flyers for roving frames	T. Mayer	46, 921
Focusing plate holder	S. W. Bureaw	50, 555
Fodder, Cutting and grinding	I. Fulton	49, 396
Folders, Fleece	C. W. Rudger	50, 040
Food, Preservation of, Buildings or rooms for the	D. E. Somes	46, 276
Food for transportation, Preserving	M. Brune	48, 898
Foot rest	C. S. Adams	48, 638
Foot warmer	A. Eckert	46, 649
Foot warmer	C. L. Palmer	47, 327
Foot warmer	A. Palmer	49, 433
Foot warmer	H. Hock and J. Zilz	50, 123
Foot warmer	J. J. Andrews	51, 534
Foot warmer and spittoon, Combined	G. B. Clark	47, 280
Forge	C. N. Taylor and E. J. Holmes	47, 467
Forge, Blacksmiths'	J. H. Gould	46, 792
Forge, Portable	J. H. Dickerson	45, 911
Forging apparatus	E. F. McFarland	45, 928
Forging apparatus	E. A. Raymond	51, 267
Forging machine	J. C. Jewell	48, 560
Forks, Hay	W. F. Rundell	47, 042

Furnace, Isomeric diaphragm, for desulphurizing.....	D. Minthorn.....	50, 836
Furnace, Portable kettle.....	J. Murdock.....	48, 302
Furnace, Puddling.....	W. and J. Groves.....	48, 390
Furnace, Puddling.....	J. Williams.....	50, 319
Furnace, Puddling.....	D. and J. Hall.....	50, 929
Furnace, Puddling.....	R. Keenan and E. O'Conner.....	50, 937
Furnace, Puddling, Fixing for.....	H. McDonald.....	50, 483
Furnace, Reverberatory.....	W. Kendrick.....	50, 718
Furnace, Smelting.....	W. Quam and W. T. Smith.....	51, 266
Furnaces, Steam blower for.....	J. A. Bassett.....	49, 823
Furnaces, Stoves, &c., Fire-pot for.....	P. P. Stewart.....	47, 049
Furnaces, Tinman's.....	E. B. Gibbald.....	49, 517
Furnace, Welding and steam-boiler, Arrangement of.....	H. J. Davidson.....	53, 562
Furnace for converting brass into steel.....	T. S. Blair.....	51, 289
Furnace for burning gas.....	C. Schinz.....	46, 536
Furnace for boiling iron.....	C. D. Baker.....	48, 355
Furnace for desulphurizing and treating auriferous and other metallic ores.....	M. B. Mason.....	45, 804
Furnace for finishing sheet iron.....	W. D. Wood.....	46, 841
Furnace for melting metals.....	W. A. Sweet.....	48, 739
Furnace for puddling iron.....	N. S. Snedeker.....	49, 565
Furnace for steam boilers, &c., Hydrocarbon blowers for.....	H. Gerner.....	48, 866
Furnace for treating ore.....	W. Kendrick.....	50, 717
Furniture, Caster for.....	R. J. Beardsley.....	46, 334
Furniture, Caster for.....	M. L. Babb.....	48, 146
Furniture, Caster for.....	P. B. Holmes.....	50, 249
Furniture, Spring caster for, Combination.....	J. H. Wilhelm and F. G. Ensign.....	51, 770
Furrowing and pulverizing device.....	C. Shabley.....	51, 757
Fuze, Blasting.....	T. H. Walton.....	45, 774
Fuze, Concussion, for explosive shells.....	G. P. Ganster.....	48, 167
Fuze, Concussion, for explosive shells.....	J. A. Curran.....	47, 803
Fuze, Safety.....	A. F. and J. H. Andrews.....	51, 679
Fuze, Time, for explosive shells.....	G. Wright.....	46, 965
Fuze hood for explosive shells.....	T. Taylor.....	47, 231
Fuze for blasting.....	J. S. Bickford.....	47, 677
Fuze for shells.....	E. Estabrook.....	45, 986
G.		
Gaining machine, Power.....	H. Bickel.....	48, 042
Gaiters, Spring.....	F. M. Blodgett.....	48, 897
Gaiter boots.....	S. Babbitt.....	46, 622
Gaiter boots.....	T. Powell.....	50, 030
Galley, Ship's.....	W. Young.....	46, 313
Galvanic batteries.....	J. Blackie.....	49, 824
Game.....	B. E. Mead.....	45, 731

Invention or Discovery.	Name of Patentee.	No.
Game boards	J. T. Edson	47, 491
Game boards	J. Smith and E. M. Nutter	47, 867
Gardening implement	R. W. Porter and J. F. Spaulding	50, 305
Garment measuring	J. B. West	45, 780
Gas	C. Noble	48, 714
Gas, Burning, Furnace for	C. Schinz	46, 536
Gas, Carbonic acid, Generating	P. and F. Hinkel	47, 205
Gas, Carburetting	S. T. McDougall	45, 729
Gas, Generating	J. Bagot	50, 548
Gas, Illuminating	W. Elmer	45, 915
Gas, Illuminating	J. Jennings	46, 473
Gas, Illuminating	O. Collins	49, 505
Gas, Illuminating	E. A. Pond	50, 385
Gas, Illuminating, Flexible tubing for	W. B. S. Taylor	46, 507
Gas, Lighting	T. W. Houchin	47, 207
Gas, Manufacture of	S. C. Salisbury	47, 986
Gas, Pressure and delivery of, Regulating	W. A. Simonds	49, 449
Gas, Purification of	A. A. Croll	47, 160
Gas and other retorts	J. Chilcott	45, 908
Gas-burner chimney	J. Stratton	49, 010
Gas engines	P. Hugon	49, 346
Gas fitter's clamp	J. Peace	48, 431
Gas fitter's hook blank	E. P. Gleason	49, 257
Gas heater	J. H. Jones	47, 426
Gas heater	J. Q. Birkey	50, 678
Gas heater, or blowpipe, for heating soldering irons	E. A. Leland	46, 527
Gas lamp posts, Street	J. T. P. Hunt	45, 717
Gas light, Fulminate	H. B. Stockwell	48, 459
Gas lighter, Electric	E. J. Frost and G. A. Lawrence	49, 254
Gas-light multiplier	J. F. Boynton	49, 705
Gas-lighting device	J. G. Harper	48, 932
Gas metres, Dry	N. Tufts, jr.	49, 935
Gas-pipe coupling	D. L. Freeborn	50, 111
Gas regulator	C. M. Cresson	47, 189
Gas regulator	J. S. Wood	49, 188
Gas regulator	W. A. Simonds	51, 664
Gas retorts, Head, neck, and connections of, Constructing the	J. Chilcott	49, 231
Gas retorts, Incrustation from, Removing	A. J. White	49, 329
Gas from petroleum, Generating	D. M. Graham	47, 634
Gates	G. Stovel	46, 954
Gates	F. Ball	46, 985
Gates	W. Tallman	48, 322
Gates	J. M. May	49, 286
Gates	S. L. Fisher	49, 615
Gates	S. Grenell, G. Bez, and H. C. Stoll	49, 753
Gates	S. M. Gillett	49, 873
Gates, Automatic folding	J. B. Mahana	45, 842
Gates, Canal, Lock-valves for	W. W. Jerome and L. K. Cole	47, 643
Gates, Canal-lock, Raising	W. Thomas	47, 138
Gates, Construction and hanging	J. Healy	46, 607
Gates, Farm	J. Martin	46, 920
Gates, Farm	J. G. Hunt	47, 307
Gates, Farm	J. Lee	47, 840
Gates, Farm	W. F. Smelley	47, 994
Gates, Farm, Hanging and latching	J. Kinman	47, 429
Gates, Fence	T. Raymond	45, 858
Gates, Fence	T. Raymond and A. Miller	48, 309
Gates, Flood	A. Ralston	48, 977
Gates, Flood, Revolving	J. Du Bois	45, 913
Gates, Flood, for mill dams	M. Colton	46, 883
Gates, Hanging	T. S. Minniss	46, 377
Gates, Railway	S. N. Cushing	46, 884
Gates, Self-acting	J. Lee	48, 698
Gates, Water-wheel, Governors for	J. H. Wooster	46, 430
Gate fastening	J. P. Woodcock	49, 819
Gate fastening	W. Broomhal	51, 417
Gate latch	J. Leonard	48, 292
Gate posts	G. O. Hutson	50, 005
Gate and field fence, Combined	J. C. Lee	50, 605
Gauges, calipers, and rules, Connecting	N. H. Bundy	49, 337
Gauges, Carpenters'	G. Miller	45, 932
Gauges, Carpenters'	M. Horton	47, 824
Gauges, Carpenters'	B. T. Currier	48, 663
Gauges, Carpenters'	J. McCrum	48, 703
Gauges, Carpenters'	G. Miller	50, 448
Gauges, Conical turning	M. Bowker	49, 073
Gauges, Diaphragm pressure	R. C. Robbins	48, 877
Gauges, Drill	W. C. Wells	51, 248
Gauges, Hemming, for sewing machines	W. Gaskill	46, 790
Gauges, Steam	T. Shaw	47, 578
Gauges, Steam	C. Barnes	49, 961
Gauges, Steam	H. W. Evans	50, 107
Gauges, Steam	C. F. Hunt	50, 581
Gauges, Steam	C. C. Smith	50, 991

Invention or Discovery.	Name of Patentee.	No.
Gauges, Steam pressure.....	E. H. Ashcroft.....	45, 685
Gauges, Steam pressure.....	E. A. Wood.....	45, 786
Gauges, Steam pressure.....	J. Davis.....	47, 936
Gauges, Steam pressure.....	J. P. Wigal.....	48, 331
Gauges, Steam pressure.....	J. D. Ingram.....	49, 033
Gauges, Steam pressure.....	C. C. Schmidt.....	50, 208
Gauges, Steam pressure.....	T. Poore.....	45, 856
Gauges, Water, for steam generators.....	H. Belfield.....	49, 366
Gauges, Water, for steam generators.....	C. T. Woodman.....	51, 274
Gauge cocks.....	J. Broughton.....	51, 418
Gauge cocks, &c.....	E. A. Walker.....	49, 016
Gauge cocks, Steam.....	V. Girond.....	49, 623
Gauges for setting the pitch to wagon axles.....	J. Horton.....	48, 928
Gauging and enlarging casks.....	W. C. Cooper.....	50, 689
Gear, Shifting.....	C. D. Rogers.....	45, 864
Gear, Wood, Cutting.....	C. R. James.....	49, 881

Hair, Brushing, Barber's apparatus for.....	C. P. Kroll.....	49, 893
Hair restorative.....	R. W. Carr.....	50, 901
Hair restorative.....	M. Howard.....	51, 319
Hair and wool from animals, Clipping.....	C. W. Emery.....	46, 226
Hair or wool from animals, Clipping.....	C. W. Emery.....	45, 821
Halters.....	H. B. Ware.....	49, 939
Halter, Neck rope.....	K. Gibbs.....	51, 582
Halter clasp.....	J. H. Plumstead.....	48, 307
Hame, Harness.....	J. E. Brown.....	51, 256
Hame fastener.....	J. B. Woolsey.....	47, 762
Hame fastener.....	A. J. Preston.....	50, 842
Hame fastening.....	W. W. Kittleman.....	47, 735
Hame and horse collar.....	M. Killackey.....	46, 606
Hammer.....	J. H. Littlefield.....	49, 898
Hammer.....	C. Monson.....	50, 262
Hammer, Atmospheric.....	W. D. Grimshaw.....	43, 896

Invention or Discovery.	Name of Patentee.	No.
Hammer, Atmospheric	H. Shattuck	49, 592
Hammer, Carpenter's	J. O. Montignani	46, 574
Hammer, Dental	J. C. Dean	43, 703
Hammer, Drop	J. Evans	47, 405
Hammer, Steam, Valve gear for	C. W. Willard	49, 462
Hammer, Steam, Valve gear of	J. Watt	50, 407
Hammer, Trip	H. C. Fessel and F. Krautwadel	46, 229
Hammer, Trip	T. J. Root	46, 267
Hands, Artificial	O. Lindsay and I. Vance	50, 014
Hands, Artificial substitutes for	J. Reichenbach	48, 440
Hands and arms, Artificial	T. Uren	46, 159
Hands and arms, Artificial	T. Uren	46, 158
Handles, Horn, Attaching to knives, &c.	M. Bradley	49, 222
Handle attachment to small-arms	E. Charlesworth	50, 312
Handles to whitewash brushes	W. W. Burnett and J. P. McIntosh	50, 449
Handles for lamp chimneys	M. W. Brown	46, 212
Handle for tea and coffee pots	G. B. Halsted	48, 061
Harmoniums	J. Gilmour	48, 881
Harmoniums or cabinet organs	T. Atkins	47, 081
Harness	E. E. Hardy	47, 949
Harness	J. Calkins	48, 790
Harness	F. D. Ladenberger	51, 062
Harness, Fastening for	J. Shepard	47, 500
Harness, Loom, Wire heddles for	M. Finkle	49, 251
Harness saddles	O. B. North	47, 244
Harness saddles	P. Bottryer	47, 276
Harness saddletrees	S. E. Tompkins	45, 880
Harness saddletrees	O. B. North	46, 489
Harness saddletree	A. Koehler	47, 647
Harness snap	H. Harris	46, 468
Harness snap	H. Harris	46, 796
Harrows	M. Easterbrook	49, 867
Harrows	C. Jillson	50, 478
Harrow, Adjustable	H. Pulse	51, 750
Harrows, rotary	J. D. Parrot	50, 729
Harrow and cultivator	T. Short	46, 274
Harrow and cultivator, Combined	E. D. and O. B. Reynolds	46, 025
Harrow and roller, Combined	W. H. Converse	47, 090
Harrow and roller, Combined	W. R. Mears	50, 259
Harrow and seeder	D. L. and J. M. Barlow	45, 903
Harvester	J. W. Bope	45, 810
Harvester	D. D. Gitt	45, 823
Harvester	J. W. Bope	45, 905
Harvesters	J. W. Bope	45, 906
Harvesters	A. Wood	46, 170
Harvesters	W. F. Cochrane	46, 178
Harvesters	W. F. Cochrane	46, 179

Harvesters	J. F. Seiberling	51, 359
Harvesters	W. N. Whiteley, jr.	51, 374
Harvesters	F. Bramer	51, 546
Harvesters	J. L. Garver	51, 579
Harvesters, Beam	N. Chappell	46, 216
Harvesters, Beam	D. B. Munger	47, 320
Harvester, Binding attachment to	R. D. Brown	48, 363

Invention or Discovery.	Name of Patentee.	No.
Harvester, Clover.....	F. Decker.....	46, 547
Harvesters, Corn.....	J. W. Pope.....	45, 811
Harvesters, Corn.....	J. W. Smith.....	47, 995
Harvesters, Corn.....	S. Lane.....	48, 750
Harvesters, Corn.....	J. S. Williams.....	51, 505
Harvester, Driving-wheel of.....	E. P. Russell.....	49, 439
Harvesters, Gearing.....	A. Warner.....	50, 969
Harvesters, Guard-fingers for.....	S. Copeland.....	47, 702
Harvesters, Guard-fingers for.....	C. T. Bush.....	49, 713
Harvesters, Guard-fingers for.....	A. Wissler.....	51, 380
Harvesters, Pitman connection for.....	D. M. Osborne.....	50, 879
Harvesters, Pitman connection for.....	D. M. Osborne.....	50, 880
Harvester, Rake for.....	W. J. and R. Case.....	49, 976
Harvester, Rake for.....	W. F. Cochrane.....	50, 066
Harvesters, Rake attachments to.....	L. M. Batty.....	49, 964
Harvesters, Rake attachments to.....	W. B. Parsons.....	48, 834
Harvesters, Rake attachments to.....	L. Miller.....	51, 070
Harvesters, Rake attachments to.....	L. Miller.....	51, 071
Harvesters, Rake attachments to.....	H. Fisher.....	51, 111
Harvesters, Rake attachments to.....	R. D. Brown.....	51, 550
Harvesters, Raking attachments to.....	S. N. Page.....	46, 930
Harvesters and reel attachments to.....	R. Hoffheims.....	48, 557
Harvesters, Raks and reels for, Combined.....	S. Johnston.....	46, 300
Harvesters, Reels for.....	E. P. Russell.....	47, 338
Harvesting machines, Cutter bars for.....	G. G. Taylor.....	45, 879
Harvesting machines.....	E. P. Russell.....	46, 394
Harvesting machines.....	A. Belchambers.....	46, 628
Harvesting machines.....	S. N. Page.....	46, 929
Harvesting machines.....	J. L. Fountain.....	48, 335
Harvesting machines.....	I. H. Collar.....	48, 658
Harvesting machines.....	W. F. Cochrane.....	49, 024
Harvesting machines.....	M. A. Wheaton.....	49, 186
Harvesting machines.....	C. R. Brinkerhoff.....	49, 497
Harvesting machines.....	H. Chandler.....	49, 501
Harvesting machines.....	J. S. Davis.....	49, 506
Harvesting machines.....	L. M. Batty.....	49, 963
Harvesting machines.....	J. Werner, jr.....	50, 191
Harvesting machines.....	G. Murphy.....	50, 206
Hats.....	R. S. Nickerson and J. Wallace.....	47, 974
Hats.....	C. L. Rahmer.....	48, 092
Hats.....	D. K. Albright and L. H. De Lange.....	48, 222
Hats.....	J. P. Beatty.....	48, 357
Hats.....	R. Dunlap.....	48, 384
Hats.....	E. Morris.....	48, 828
Hats.....	W. H. Towers.....	49, 570
Hats.....	J. H. Earle.....	50, 809
Hats.....	D. W. Gitchell.....	51, 172
Hats, Attaching mourning badges to.....	T. H. Lowerre.....	48, 417
Hats, bonnets, &c., Fabrics for.....	H. Loewenberg.....	46, 568
Hats, Brushing.....	C. Faure.....	48, 235
Hats, Fabric for, Water-proof.....	W. E. Mahon.....	49, 775
Hats, Felt, Printed and embossed.....	A. Bailey.....	47, 269
Hats, Finishing.....	J. A. Roche and J. J. Stewart.....	50, 165
Hats, Printing.....	T. Byrne and T. Henry.....	47, 516
Hats, Ventilating.....	W. Smith.....	50, 285
Hats, Ventilating.....	D. K. Albright and L. H. De Lange.....	50, 999
Hat bodies, Forming and napping.....	R. Eickemeyer.....	46, 552
Hat bodies, Stiffening.....	T. Trowbridge.....	48, 328
Hat bodies, Stretching.....	R. Eickemeyer.....	46, 553
Hat frames.....	A. Komp.....	48, 412
Hat frames, Skeleton, Metallic.....	A. Komp.....	47, 431
Hats and bonnets, Embossing.....	H. E. West.....	49, 049
Hats and bonnets, Pressing.....	H. E. West.....	49, 048
Hats and bonnets, Pressing.....	E. Copleston.....	49, 384
Hay, Cutting and preparing, for baling.....	S. Colahan.....	46, 993
Hay, Cutting and pressing.....	R. Wakeman and J. L. Balance.....	47, 883
Hay, Loading.....	S. R. Higgins.....	45, 826
Hay, Loading.....	R. Cobb.....	51, 294
Hay, Raking and bunching.....	L. Wallace.....	51, 500
Hay, Raking and loading.....	W. A. Duncan.....	46, 647
Hay, Raking and loading.....	J. N. Smith.....	46, 863
Hay, Raking and loading.....	M. K. Lewis, J. C. Durbin, and L. P. Lewis.....	49, 423
Hay, stone, &c., Gathering and loading.....	G. W. Holley.....	48, 175
Hay-elevating fork.....	W. S. Newton.....	46, 018
Hay elevators.....	S. Rogers.....	46, 027
Hay elevator and stacker.....	A. W. Tooker.....	48, 742
Hay forks, Horse.....	R. Reynolds and C. Young.....	47, 982
Hay loaders.....	M. K. Lewis and J. C. Durbin.....	45, 726
Hay loaders.....	W. Platt and A. G. Burnham.....	46, 139
Hay racks.....	A. Naramor.....	46, 017
Hay spreaders.....	W. C. Gifford.....	45, 992
Hay spreaders.....	D. Lyman.....	47, 437
Hay spreaders.....	H. Beers.....	47, 919

Invention or Discovery.	Name of Patentee.	No.
Hay spreader and elevator, Combined	T. C. Craven	51,650
Hay spreader and horse rake, Combined	G. N. Palmer	51,473
Hay-spreading machines	C. Willard	49,021
Hay for baling, Preparing	G. H. Nye	45,853
Head, Coverings for the	T. Brachter	48,510
Head dresses, Bands for	N. Grant and G. Downs	48,677
Head dresses, Waterfall, for ladies	P. Walter	46,961
Head-rest for railroad car seats	N. Gates	48,270
Head-rest for railroad car seats	W. R. Phelps	48,586
Heat, Utilizing, from a furnace	P. Bennett	50,551
Heaters	J. Chilcott	49,504
Heaters	E. C. Robinson	49,652
Heaters	C. C. Hare	50,354
Heaters, Feed-water	R. Poole	47,499
Heaters, Feed-water	W. B. Cross	50,459
Heaters, Feed-water, for steam boilers	W. A. Lighthall	46,252
Heaters, Fireplace	H. H. Welch	49,325
Heaters, Gas	J. H. Jones	47,426
Heaters, Gas	J. Q. Birkey	50,678
Heaters, Mercurial	T. C. Hargrave and W. King	48,276
Heaters, Sad-iron	H. W. Dopp	48,380
Heaters, Steam	L. V. Fichet	50,346
Heater, Water, Laundry	J. Keane	48,561
Heater, Water, Stove-pipe	J. Baumeister	48,253
Heater for buildings	J. A. Lawson	46,250
Heaters for liquids, Portable	W. N. Hancock	46,665
Heater for skates	O. W. Taft	51,492
Heating, cooling, and ventilating	D. E. Somes	51,236
Heating, Steam, and fire-extinguishing apparatus	C. S. Brown	46,328
Heating apparatus, Steam, Coils for	J. Trageser	49,509
Heating apparatus, Water	J. McClosky	50,422
Heating and cooking apparatus	E. Edwards	47,706
Heating and fuel-saving device	D. C. Colby	47,489
Heat-controller attachment	M. T. Hitchcock	49,029
Heat-radiating attachments for stoves or furnaces	J. B. Hyzer	48,180
Heat radiators	H. Rugee	46,500
Heat radiators	D. G. Fletcher	47,535
Heat radiators	A. Edwards	58,540
Heat radiators for stoves	W. E. Rennolds	46,941
Heat radiators for stove-pipe	N. F. Goodrich	50,069
Heat and cold, Applying, in the treatment of diseases	J. Chapman	46,535
Hedges, Trimming	W. C. Hooker	48,946
Hedge trimmer	A. Selover	49,311
Heel calks	T. Symonds	51,241
Heel-polishing machine	J. M. Thompson and S. D. Tripp	46,761
Heel-trimming machine	J. A. Sargent	47,341
Heel-shave	J. Ross	48,448
Hemming guides	W. Gaskill	47,629
Hemmers for sewing machines	H. Goebel	47,632
Hemming guide	W. Gaskill and G. H. Knight	47,630
Hemp, flax, &c., Fibres of, Separating	J. B. Fuller and J. P. Upham	47,539
Hemp, flax, jute, grass, &c., Treating	S. M. Allen	48,782
Hemp, flax, &c., Manufacture of paper pulp, Treating	M. A. Cushing	50,419
Hemp, flax, &c., Preparing, for spinning	J. B. Fuller and J. P. Upham	47,538
Hides, Hair from, Removing	M. Bray	49,496
Hides, Hair from, Removing	S. S. Weed	49,839
Hides, Hair and lime from, Removing	S. S. Weed	49,811
Hides, liming	S. J. Miller, A. B. Barnett, and W. H. Study	48,578
Hinges	N. Sehner	48,630
Hinges	S. R. Dummer	49,511
Hinges	J. Close and I. Buckman, jr	49,982
Hinges	H. Young and M. Stachelin	50,411
Hinges	M. Riley	50,423
Hinges	S. R. Dummer	50,506
Hinges	J. Close and I. Buckman, jr	51,426
Hinges	E. W. Gilmore	51,447
Hinges	E. N. Porter	51,476
Hinges	W. C. McGill	51,604
Hinges	S. H. Frink	51,711
Hinges	L. Upham	50,861
Hinges, Shutter	R. Lee	46,251
Hinges, Shutter	C. P. Knauer	48,075
Hinges, Shutter	S. Drum	48,264
Hinges, Shutter	D. G. Coppin	50,009
Hinges, Shutter, and fastening	W. S. Gerard	50,230
Hobby-horse	P. J. Marqua	46,258
Hod	J. Short	50,741
Hoes	A. Patterson	49,640
Hoes, Weeding	J. Naugle	48,304
Hoes, Weeding	C. Croft	49,985
Hoes, Weeding, Adjustable	A. C. Arnold	50,436
Hog scalders, Portable	A. Clark	51,781
Hog tamer	T. G. Pelton	47,329

Invention or Discovery.	Name of Patentee.	No.
Hoisting apparatus.....	W. K. Marvin.....	46, 257
Hoisting apparatus.....	C. R. Otis.....	46, 580
Hoisting apparatus.....	G. Ambrose.....	47, 782
Hoisting apparatus.....	J. A. Talpey.....	47, 878
Hoisting apparatus.....	S. M. Longley.....	50, 607
Hoisting apparatus, Steam.....	C. R. Otis.....	47, 773
Hoisting apparatus, Steam.....	C. R. and N. P. Otis.....	51, 076
Hoisting machine.....	C. Abel.....	45, 962
Hoisting machine.....	S. B. Phelps and C. A. Slack.....	47, 036
Hoisting machine.....	M. Willard.....	47, 761
Hoisting machine.....	J. Bird.....	48, 044
Hoisting machine.....	W. Miller.....	48, 579
Hoisting machine.....	P. Higdon.....	51, 719
Hoisting tackle.....	J. W. Norcross.....	51, 742
Hoisting and lowering apparatus.....	I. J. Lancaster.....	48, 414
Holder, Book-stand.....	W. W. Marston.....	49, 639
Holder, Chalk, for billiard tables.....	H. M. Wall.....	51, 499
Holder, Clutch or rope.....	C. A. Emery.....	49, 990
Holder, Plate, Focusing.....	L. W. Burcaw.....	50, 555
Holder, Rein and backstrap, Combined.....	J. Bullene.....	51, 420
Holder, Sand-paper.....	J. and N. W. Redding.....	46, 702
Holder, Self-sustaining chuck for.....	T. H. Worrall.....	48, 612
Holder, Tool, Adjustable.....	C. P. Benoit.....	46, 438
Holder for fruit jars.....	C. G. Imlay.....	50, 301
Hoods, Ladies'.....	E. Hill.....	48, 867
Hooks.....	W. W. Knight and J. H. Orne.....	49, 535
Hooks, Bench, and clamp.....	E. P. Wood and A. E. Blood.....	48, 498
Hooks, bending and punching.....	P. L. Weimer.....	50, 757
Hooks, Breeching.....	J. H. Littlefield.....	48, 415
Hooks, Breeching, for vehicles.....	E. Brown.....	48, 513
Hooks, Chain.....	M. Colgan.....	47, 241
Hooks, Elastic mousing for.....	E. E. Stone.....	49, 316
Hooks, Fish.....	W. Davis and J. Johnson.....	51, 651
Hooks, Fish, Double-lever.....	G. Crandell.....	50, 799
Hooks, Fish, Making.....	C. O. Crosby.....	46, 644
Hooks, Pruning.....	L. M. Harris.....	46, 797
Hooks, retaining and releasing.....	T. E. Purchase.....	46, 385

Ice, Cutting and shaving	S. E. Blake	46, 331
Ice, Levelling and smoothing	W. Wharton, jr.	47, 237
Ice, Manufacture of	C. M. Keller and T. Henderson	49, 887
Ice scraper	H. W. Harkness	48, 173
Ice creeper	T. Symonds	50, 512
Ice creeper	D. Green	50, 253
Ice crusher	W. W. Armington	50, 198
Illuminating public clocks	T. I. Bailey	51, 411
Incendinary compound	H. W. Libbey	48, 187
Inclinometers	A. Chase	49, 675
India rubber, Curing	J. B. Forsyth	51, 036
India-rubber fabrics, Binding for	C. A. Ensign	51, 161
India-rubber packing former	W. Webster	47, 477
Indicators, Low-water	J. W. Bishop	47, 183
Indicators, Low-water, for steam boilers	G. A. Riedel	47, 365
Indicators, Time, for railroad trains	J. C. S. Fitzpatrick	46, 787
Indicators, Steam-pressure	W. M. Davis and C. T. Webber	47, 166
Injectors, Air	J. A. Bassett and O. C. Smith	48, 011
Injector, Gifford	W. Sellers	49, 445
Injectors, Liquid, Gaseous	C. Schultz and T. Warker	50, 500
Ink, Printers'	G. Duryee	48, 385
Ink, Printing	A. A. Hulot	47, 909
Ink, Red	T. J. Lummas	46, 684
Inkstand	F. L. Hicks	45, 794
Inkstand	S. Darling	49, 083
Inkstand	J. Axtman	49, 211
Inkstand	B. S. Fletcher	49, 617
Inkstand, Fountain, Operating parts of	W. A. Wheeler	47, 060
Inkwells	F. C. Brownell	47, 616
Insects, Preventing them from injuring fruit trees, &c	C. Fisher	49, 869
Insignia, Military, Woven into cloth	A. M. Dorman	49, 330
Instruments for curing piles	J. P. Gilbert	47, 540
Insulators for telegraphs	S. F. Van Choute	47, 141
Insulators for telegraph wires	L. A. Cauvet	48, 906
Insulators for telegraph wires	H. H. Ward	49, 482
Invalids, Table and apparatus for	S. Ustick	46, 807
Iron, Curling	H. D. Jennings	48, 626
Iron, Curling	H. Christian	50, 085
Iron, Hardening	T. H. Jenkins	51, 723
Iron, Manufacture of	A. H. Everett	48, 483
Iron, Manufacture of	J. D. Williams	49, 331
Iron, Manufacture of	J. D. Williams	51, 771
Iron, Manufacture of, and composition	A. H. Everett	47, 198
Iron, Puddling	J. Griffiths	48, 485
Iron, Sheet	D. L. Pratt	46, 384
Iron, Sheet	J. and T. Grey	50, 203

Invention or Discovery.	Name of Patentee.	No.
Iron, Sheet, Annealing and polishing	J. W. Ells	42, 918
Iron, Sheet, Cleansing	E. A. Harvey	47, 103
Iron, Smelting	F. Lang and C. A. Frey	51, 531
Iron, Smoothing	J. W. Currier	48, 526
Iron, Soldering, Heating, Blow-pipe or gas-heater for	E. A. Leland	46, 527
Iron, Wrought	R. Thomas and G. Edwards	49, 175
Iron, Wrought, from the ore, Manufacture of	H. Boardman	48, 478
Iron, Upsetting, cutting, and punching	J. J. Rose	49, 158
Iron railings for fences	S. Crowell	47, 801
Iron and steel	H. Bessemer	49, 051
Iron and steel	H. Bessemer	49, 052
Iron and steel	H. Bessemer	49, 053
Iron and steel	H. Bessemer	49, 055
Iron and steel, Bars, shafts, and other articles of	C. Sanderson	50, 084
Iron and steel, Cast, Uniting with wrought or cast iron surfaces	J. D. Whelpley and J. J. Storer	50, 976
Iron and steel, Malleable	H. Bessemer	51, 399
Iron and steel, Malleable	H. Bessemer	51, 400
Iron and steel, Malleable	H. Bessemer	51, 401
Iron and steel, Manufacture of	G. Perry	47, 506
Iron and steel, Manufacture of	J. Henderson	50, 474
Iron and steel, Manufacture of	H. Bessemer	51, 397
Iron and steel, Manufacture of	H. Bessemer	51, 398
Iron and steel, Ovens for converting	W. A. Sweet	45, 878
Iron and steel, Plating	E. Savage	51, 754
Iron and steel from the ore, Manufacture of	C. H. Dupuy	46, 549
Iron for strap points	W. D. Rinehart	49, 683
Irregular forms, Rolling	J. Dodge	48, 915
Ivory, Artificial	C. F. Dupper	51, 109
Ivory, Cutting	C. B. Rogers	47, 572
Ivory, cutting rings for	C. H. Bassett	49, 191

Looms	W. Tunstill	47, 687
Looms	J. Braun	49, 369
Looms	S. C. Mendenhall	49, 644
Looms	J. Welsh	49, 814
Loom, Circular	R. W. Andrews	50, 215
Looms, Cloth registering attachment for	J. J. Greenough	51, 040
Looms, Hand	C. C. Temple	48, 325
Looms, Hand	J. G. and H. T. Henderson	46, 798
Looms, Hand	J. W. Hayes	49, 589
Looms, Hair-cloth, Weft-feeding device for	J. Seamon and W. G. Henderson	50, 041
Looms, Heddle frames for	J. Blanchard	46, 442
Loom, Jacquard apparatus for	M. Finkle	48, 057
Looms, Let-off for	L. D. Valetton	50, 993
Looms, Let-off for	H. Flake	49, 472
Looms, Let-off for	W. W. Pomeroy	49, 479
Looms, Let-off for	P. Phillips	50, 156
Looms, Let off and take up motion for	D. Bassett	51, 003
Looms, Motion, Let off	S. Estis	49, 950
Looms, Picker for	B. F. Day and C. H. Nelson	50, 227
Looms, Picker checks for	L. J. Labounty	49, 830
Looms, Picker motion for	J. Cady	47, 517
Looms, Picker-staff connection in	W. Wieland	49, 182
Looms, Power, Harness motion for	C. Duckworth	49, 096
Looms, Shuttles for	W. Wilder	46, 040
Looms, Shuttles for	J. H. Coburn	48, 154
Looms, Tape, Spooling machine for	J. Gibbs	51, 038
Looms, Warp-beam of, Friction mechanism for the	O. Kenison and O. J. McClary	46, 475
Loom-shuttle, Operating	D. Bickford	51, 006
Looms for cross-weaving	C. Roder	50, 990
Loom harness, Wire beddles for	M. Finkle	49, 251
Loom for lappet weaving	W. Aspinall	50, 764
Loom for weaving embroidered fabrics	J. G. Spitzli	51, 095
Loom for weaving double-faced pile fabrics	P. Joyot, jr.	46, 433
Loom for weaving goods with elastic strands, Tension mechanism for	L. Hull	49, 271
Loom for weaving plush or piled fabrics	S. Holt	40, 754
Lounge or sofa	E. Smith	50, 397
Lowering and hoisting apparatus	I. J. Lancaster	48, 414
Lubricant for wood	B. A. Earle	46, 551
Lubricating apparatus	J. F. A. Aerts	51, 276
Lubricating compound	J. Lossiel	50, 015
Lubricating compound	D. C. Taylor	50, 049
Lubricating compound for journal boxes	H. Colby	49, 983
Lubricating machinery	P. E. Proust	46, 836
Lubricating the packing of stuffing-boxes, &c.	J. B. and W. H. Miller	47, 170
Lubricators	J. Broughton	45, 694
Lubricators	J. F. A. Aerts and P. F. Aerts	46, 196
Lubricators	T. W. Goodwin	46, 231
Lubricators	F. Bresson	47, 367
Lubricators	L. H. Olmsted	47, 561
Lubricators	T. G. Polton and J. Brewer	49, 148
Lubricators	J. H. Ferguson	50, 233
Lubricators	S. E. Kleinschmidt	50, 719
Lubricators	J. Broughton	51, 419

Moulds, Brick	G. I. Washburn	48, 607
Moulds, Brick	J. Hamer and T. Lippincott	49, 105
Moulds, Butter	J. F. Schuffenecker	46, 272
Moulds, Crucible	O. Allen	46, 319
Moulds, Facing	T. G. French	50, 812
Moulds, Facing, Powder for	J. and A. Hursh	49, 272
Moulds, Metal, Casting grooved rolls in	J. Nichols and W. Batty	46, 578
Moulds, Shank of, Holding, for glass buttons	R. C. Totten	50, 187
Moulds for button making	G. Matthewman	50, 374
Moulds for casting, Forming	G. Matthewman	48, 082
Moulds for casting metal safes, vaults, and similar substances	W. T. Horrobin	46, 564
Moulds for casting railroad bars	L. Lillie	51, 125
Moulds for enema syringes	H. Jenkins	50, 362
Moulders' bench	F. B. Richardson	50, 957
Moulders' match plates	C. L. Bishop	46, 209
Moulders' sprues	C. Truesdale and A. Smith	51, 366
Moulding, Enamelling	M. R. Howell	45, 716
Moulding cores	B. McEachren	50, 146
Moulding potters' ware	J. P. Davis	47, 937
Moulding and frames	E. N. Blackmer	50, 791
Mouth piece, Safety, Submarine	G. Henze	49, 829
Mouth piece for cigars	J. Hawkins	46, 902
	J. Ball	46, 986

Packages, boxes, &c, Manufacture of.....	H. Everett	47, 532
Packages, letters, &c., Transmitting and delivering.....	A. E. Beach	49, 699
Packages and mails, Delivering, from railroad cars.....	C. D. Everett	51, 162
Packages and mails on railroad cars, Receiving and delivering.....	W. J. Ketcham	48, 954
Packing, Elastic, for the exterior of pumps in deep wells.....	J. Moulton	46, 860
Packing, Metallic, for steam piston.....	H. D. Dunbar	50, 697
Packing, Piston.....	A. J. Stevens	46, 723
Packing, Piston.....	W. R. Thomas	46, 733
Packing, Piston, for pumps.....	D. B. Fuller	45, 989
Packing, Tube.....	S. L. Fox	45, 822
Packing, Well.....	J. Calkins and J. Frazier	50, 558
Packing former, India-rubber.....	W. Webster	47, 479
Packing rings for piston rods.....	W. C. Conwell	49, 725
Packing tubes of oil wells.....	R. A. Wilder	50, 194
Packing for artesian wells.....	S. Swartz	48, 599
Packing for deep wells.....	F. Martin	49, 903
Packing of pistons in deep wells, Adjusting.....	E. D. Brown	50, 898
Packing for oil wells.....	J. R. Cross	46, 217
Packing for oil wells.....	J. R. Cross	50, 910
Packing for oil well tubes.....	C. L. Noe	49, 544
Packing for oil well tubes.....	P. Scicouret	49, 579
Packing for oil well tubes.....	G. E. Mills	49, 778
Packing for oil well tubes.....	J. Parham, jr	49, 783
Packing for pistons, &c.....	J. V. and W. H. Miller	47, 119
Packing for rifled projectiles.....	F. Schenkl	45, 951
Packing of stuffing boxes, &c., Lubricating.....	J. B. and W. H. Miller	47, 170
Packing for tubes of boilers or condensers.....	J. Newkirk	49, 295
Pads, Breast, Ladies'.....	J. A. Mason	45, 843
Paddlewheel, Feathering.....	G. A. Keene	45, 835
Padlock.....	W. Bohannan	46, 539
Padlock.....	E. Coyle	46, 643
Padlock.....	H. Jackson	49, 113
Padlock.....	H. D. Blake	49, 468
Padlock.....	T. Slaight	51, 488
Padlock.....	V. Enders	51, 576
Paging and numbering machine.....	G. J. Hill	48, 488
Pails, Painting, Tool for.....	J. Carter	46, 075
Paint.....	E. Battley	49, 467
Paint.....	J. B. Hodgskins	51, 317
Paints, enamels, &c., Composition for.....	M. W. Brown	49, 705
Paint composition.....	J. Ball and J. Ford	49, 066
Paint composition.....	J. C. Wendrem	49, 201
Paint compound.....	D. P. Flinn	50, 608
Paint for ships' bottoms.....	J. G. Tarr and A. H. Wonson	48, 221
Paint for ships' bottoms.....	D. Parkhurst	48, 583
Paint for the bottoms of ships.....	J. G. Tarr and A. H. Wonson	48, 323
Painting pails, Tool for.....	J. Carter	46, 075
Pan, Amalgamating.....	S. W. Bullock	48, 480
Pan, Dust, and brush.....	C. H. Parker and G. Burnham	50, 270
Pan, Evaporating.....	G. Bez	47, 511
Pan, Evaporating.....	H. F. Bartlett	49, 694
Pans, Metal, Sheet.....	C. F. Chambers	48, 516
Pans, Metal, Sheet, Pressing.....	F. M. Woods	50, 410
Pans, Milk.....	F. J. May	50, 256
Pan, Rendering.....	A. Black	47, 788
Pan, Sap.....	H. Earl	47, 401
Pan, scale and funnel.....	A. A. Smith	50, 636
Panoramic and photographic views, Taking.....	J. R. Johnson and J. A. Harrison	51, 279
Pantaloon.....	B. J. Greeley	50, 242
Pantaloon guard, boot drawer and spur carriers, Combined.....	E. P. Watson	45, 776
Pantry.....	J. Shattuck	48, 631
Pap or slop of clay for potters' use.....	J. Muir	45, 736
Paper.....	J. M. Allen	49, 209
Paper.....	J. W. Dixon	51, 568
Paper.....	J. B. Read	51, 751
Paper, blotter weight, rule, cutter, and square, Combination of.....	A. H. Trego	50, 404
Paper, Cigarette.....	F. X. Huzman and L. L. Arnold	48, 936
Paper, Cutting.....	C. Wells and H. Barth	49, 018
Paper, Cutting, in sheets.....	J. Hatch	48, 395
Paper, Delivering, from printing presses.....	C. O. Furbush	47, 411
Paper, Drying.....	J. R. Rogers	46, 026
Paper, Fastening for, Adhesive.....	G. R. Burdon	46, 071
Paper, Lace, Make.....	C. Lang	46, 115
Paper, Lining, Substitute for.....	G. Munger	50, 485

Invention or Discovery.	Name of Patentee.	No.
Paper, Preparing, for photographic use	J. D. W. Brinkerhoff	51,010
Paper, Punching, for telegraphs	M. Lefferts	51,464
Paper, Sheets of, Plating or finishing	C. T. Brainbridge	49,691

Reamer and drill for oil and other wells	J. Burns	51, 138
Reapers, Binding attachments to	J. M. Ring	49, 889
Reaping machine	D. Wolf	46, 169
Reaping machine	H. W. Bill	46, 630
Reaping machine	J. O. Brown, A. Ingham, and T. T. Lomont	49, 077
Reaping machine	H. Fisher	49, 194
Reaping machine, Binding attachment for	J. Behel	49, 970
Reaping machine, Binding attachment to	J. S. Jones	48, 690
Reaping machines, Guard finger for	A. Winterburn	48, 473
Reaping and mowing machines	T. Swain	45, 798
Reaping and mowing machines	O. T. Holbrook	45, 827
Reaping and mowing machine	T. Welch	49, 184
Reed, Expandible, for warp dressing and weaving	A. J. Nichols	46, 381
Reed, Fishing-line	W. M. Stewart	49, 663
Reels for harvester	E. P. Russell	47, 338
Reflector, Fastening for, Adjustable	S. D. Ingram	49, 525
Reflector for lamp and gas burners	J. Redding	51, 344
Refrigerator	T. S. Blake and O. E. Mosher	45, 690
Refrigerator	O. E. Mosher	47, 123
Refrigerator	L. D. Buñ	47, 617
Refrigerator	A. Forbes and J. Macbeth	51, 035
Refrigerators, packing and preserving houses, and other similar structures, Cooling	D. E. Somes	46, 595
Refrigerator for preserving articles of food	D. E. Somes	46, 277
Refrigerator or house for preserving animal and vegetable substances	J. H. Fisher	49, 098
Refrigerators and condensers	W. A. Lighthall	46, 368
Registers, Grain	J. T. Wiley	49, 817
Registers, Passenger	E. Hackett	46, 663
Registers for counting revolutions	V. Girond	48, 927
Register for libraries	W. T. Ray	49, 788
Register for street cars	J. B. Greenhut	51, 453
Register and summer piece, Combined	S. S. Bent	45, 688
Registering the number of shoes soled by a sewing machine	A. J. Tewksbury	50, 642
Regulators, Gas	C. M. Cresson	47, 189
Regulators, Electro-magnetic	F. F. A. Achard	49, 842
Regulators, Valve, Safety	P. Riordan	46, 142
Regulators, Water	J. W. Bishop	47, 184
Regulators for the wicks of lanterns	H. W. Bleyer	48, 254
Rein-holder	T. L. Tripp	49, 806
Rein-guards for vehicles	C. B. Guy	51, 041
Rein and back-strap holder, Combined	J. Bullene, jr.	51, 420
Rendering apparatus	C. E. Gray	46, 793
Reservoir for beer, wine, &c.	M. Tschirgi	47, 347
Reservoir for compressed air	L. Ransom	49, 787
Retorts, Clay, Decarbonizing	G. W. Edge	49, 989
Retorts, Gas or other	J. Chilcott	45, 908
Retorts, Gas, Head-necks and connections of	J. Chilcott	49, 231
Retorts, Gas, Incrustation from, Removing	A. J. White	49, 329
Retorts for distilling petroleum	G. H. S. Duffus	46, 088
Retorts for distilling petroleum	G. H. S. Duffus	46, 089
Retorts for distilling petroleum	G. H. S. Duffus	46, 090
Ribbons, tapes, and threads for use, Arranging	M. B. Westhead	50, 318
Ribbons for hand-stamps, Composition for preparing	H. Holt	47, 494
Rice, Hulling, cleaning, and polishing	C. E. Rowan	46, 708
Rigging standing, Attaching shear-pole to	E. Smith	50, 046
Ring, Clinch	J. A. Coleman	48, 157
Ring, Cutting, from iron	C. H. Bassett	49, 191
Ring, Strap-clamp	J. Cogan	50, 688
Ripping sutures in cloth	F. B. Converse	48, 662
Rivets	J. N. Dennison	46, 297
Rivets	J. W. Smith	46, 504
Road-making device	T. T. Barber	49, 693
Rock crusher	S. F. Hodge	48, 813
Rock-drill apparatus	W. S. Fickett	47, 290
Rockets, Sky	J. W. Hadfield	51, 176
Rods, Pump and other oscillating, Protection for	L. Wilson	48, 880
Rolls, Drawing-frame	J. M. Stone	47, 667
Rolls for machines for preparing fibrous material for spinning, &c.	D. Read	48, 134
Rolls for rolling railroad rails	A. J. Gustin	50, 816
Roller, Covering, for wringers	R. B. Huganin	47, 827
Roller, Covering with cloth or canvas, Clamp for	H. H. Holly	51, 182
Roller, cultivator, and seeder, Combined	J. P. Long	46, 480
Roller, Dough	D. B. Baker	51, 539

Invention or Discovery.	Name of Patentee.	No.
Roller, Fluted	W. Weild	50, 997
Rollers, Guide for	H. Waters	48, 466
Rollers, Leather	D. H. Priest	50, 079
Rollers, Mill	W. S. Seymour	50, 281
Roller, plaster, and seed sower, Combined	H. S. Babcock and S. H. Jenks	45, 686
Roller, Printers', Refining the surface of	C. Sentell	48, 453
Roller, Seeding machine and drag, Combined	W. H. Hartman	48, 063
Roller, Spring	J. and G. S. Goodspeed	46, 896
Roller, Washing	H. L. Meservy	49, 288
Roller, Washing	J. E. Atwood	49, 359
Roller-cleat for trunks	J. A. Lieb and J. Schmadel	47, 114
Roller crushing machine	A. Hitchcock	50, 247
Roller for cotton-gins	I. F. Brown	45, 695
Roller for trunks	J. Schmadel and J. A. Lieb	48, 214
Roller of washing machines, Covering	R. B. Huganin	50, 712
Roller and corn-planter, Combined	P. Conrad	46, 083
Roller and drag, and seeding machine, Combined	W. H. Hartman and S. Sheffer	45, 825
Roller and harrow, Combined	W. H. Converse	47, 090
Roller and harrow, Combined	W. R. Mears	50, 259
Rolling apparatus	E. Wassell	48, 496
Rolling irregular forms	J. Dodge	48, 915
Rolling-pin	C. E. Phillips	47, 979
Rolling-pin	G. L. Witsil	50, 528
Rolling-pin and cake-cutter	I. N. Pyle	50, 732
Rolling tapering bars or plates of metal	J. Holmes	48, 863
Roofs, the decks of vessels, &c., Applying covering to	J. Hall	48, 060
Roofing	J. W. Kingman	45, 723
Roofing, Mastic, Preparing	R. Skinner, G. Duncan, and C. Merighi	50, 177
Roofing, tubing, tanks, wainscoting boats and other structures, Material for	J. K. Mayo	51, 735
Roofing bracket	C. A. Kirkpatrick	48, 818
Roofing composition	W. L. Potter	46, 495
Roofing composition	N. Groh	47, 416
Roofing composition	L. Groneweg, J. H. Palte, and C. F. Jones	51, 309
Roofing material, Preparing	A. Robinson	48, 311
Rooms or buildings for preservation of food and for other purposes	D. E. Soines	46, 276
Root cultivator and weeder	C. Jarvis	45, 831
Ropes, cards, &c., Making	J. O. Matthias	46, 057
Rosin, oil, spirits of turpentine, and other products from pine wood, Obtaining	A. H. Emery	46, 092
Rosin, Substitute for	D. T. Wilson	48, 634
Roving frames	T. Mayor	46, 530
Rowlocks	J. W. Norcross	46, 132
Rowlocks	J. W. Norcross	46, 816
Rowlocks	J. W. Norcross	48, 975
Rowlocks	I. C. and F. W. Flagg	49, 395
Rowlocks	P. W. Neefus	50, 264
Rowlocks	M. L. Babb	50, 547
Rowlocks	I. C. and F. W. Flagg	51, 032
Rubber, &c., Cutting	E. Hubner	47, 421
Rubber, Hand	D. D. Parmelee	48, 993
Rubber, Hard, Article made of	G. S. Rice	47, 457
Rubber, Hard, or vulcanite	D. D. Parmelee	48, 992
Rubber, Moulding	J. R. Moffitt	51, 207
Rubber, Packing, for dental purposes	F. C. Brown	49, 969
Rubber, White	F. Marquard	51, 331
Rubber rolls to shafts, Uniting	F. Marquard	51, 332
Rubber for dental purposes	W. H. Grant	46, 464
Rudder	I. Woolworth	51, 642
Rudder	T. G. Crosby	45, 959
Rudder	J. Higbee	46, 753
Rudder	N. D. Le Pelley	46, 807
Rudder	J. Higbee	48, 940
Rudder with corrugated surfaces	S. J. Seely	46, 147
Rules, Carpenters'	B. G. Martin	49, 037
Rules, Folding, Joint of	J. A. Traut	48, 327
Rules, gauges, and calipers, Connecting	N. H. Bundy	49, 337
Rules, Gear cutting	C. B. Long	47, 436
Rules, Square, cutter, blotter, weight, and paper, Combination of	A. H. Trego	50, 404
Rulers	S. L. Simpson	48, 454
Rulers, Metallic	D. Munson	51, 609
Rulers, Parallel	E. C. Gillette	46, 348
Rulers, Parallel	W. L. Woods	50, 980
Ruler and paper cutter	J. Woodward	48, 756
Ruling and printing machines, Combination of	H. J. Hewett	50, 475
S.		
Saccharine liquids, Boiling and evaporating	D. M. Cook	48, 522
Saccharine liquids, Evaporating	B. Brown	46, 069

Invention or Discovery.	Name of Patentee.	No.
Saccharine solution and sirups, Treating.....	E. P. Eastwick.....	47, 402
Sacks, Catamenial.....	E. L. Perry.....	49, 915
Sacks, Flour.....	J. M. Hurd.....	51, 722
Saddles, Harness.....	O. B. North.....	47, 244
Saddles, Harness.....	P. Böttyer.....	47, 276
Saddles, Riding.....	G. H. Meeker.....	47, 771
Saddle-tree.....	A. Koehler.....	47, 960
Saddle-tree, Harness.....	S. E. Tompkins.....	45, 880
Saddle-tree, Harness.....	O. B. North.....	46, 489
Saddle valise.....	R. McMurray and J. S. Topham.....	47, 028
Sad-iron.....	R. Drake.....	48, 129
Sad-iron fixture.....	D. L. Shaw.....	49, 446
Safes.....	M. Briggs.....	46, 634
Safes, Fire.....	J. Farrel.....	46, 228
Safes, Money.....	B. Cole.....	46, 779
Safeguard for protecting pottery ware.....	B. Jackson.....	46, 109
Sail clutch.....	E. F. Sawyer.....	48, 103
Sails, Fore and aft, Reefing.....	J. Hart.....	51, 529
Sails, Vessel, Lazy jack for.....	D. R. Arnold.....	47, 178
Salinometers.....	P. B. O'Neill.....	50, 380
Salts of chromium.....	B. Margulies.....	49, 682
Salve.....	W. Slape.....	49, 198
Sand, &c., Pulverizing.....	J. G. Savage.....	46, 713
Sand distributor for railway cars.....	C. M. Bromwich.....	51, 646
Sand-paper holders.....	J. and N. W. Redding.....	46, 702
Sandal, ice.....	T. J. Linton.....	46, 682
Sandal, ice.....	E. Fitzki.....	47, 006
Sap spile.....	M. Hays.....	45, 996
Sash, Greenhouse.....	I. F. Hersam.....	51, 717
Sash, Window, Metallic.....	C. Neer.....	46, 305
Sash, Window, Retainer for.....	J. H. Weeks.....	46, 512
Sash, Window, Supporter for.....	J. G. Perry.....	45, 747
Sash, Window, Suspenders for.....	J. H. Williams.....	45, 748
Sash fastener.....	W. C. McGill.....	46, 481
Sash fastener.....	A. Westcott.....	48, 856
Sash fastener.....	G. Leining.....	48, 960
Sash fastener.....	A. H. Howe.....	49, 159
Sash fastener.....	J. B. Masser.....	51, 469
Sash fastening.....	R. Lee.....	47, 962
Sash fastening.....	S. M. Richards.....	49, 592
Sash fastening.....	O. S. Judd.....	50, 136
Sash supporter.....	W. C. Fisher.....	47, 709
Sash supporter.....	A. M. Sawyer.....	49, 442
Sash supporter.....	W. C. McGill.....	49, 541
Sash supporter.....	W. Conner.....	50, 098
Sash supporter.....	E. A. Campbell.....	50, 332
Sash supporters, Window.....	H. F. Jenks.....	46, 472
Sash for roofs of hot-houses.....	H. N. Woodward and W. Holden.....	48, 126
Sash to window cords, Attaching.....	J. J. Adams.....	49, 489
Sash and window frame.....	C. B. Shaw.....	50, 393
Sausage filler.....	J. G. Perry.....	45, 743
Sausage filler.....	O. W. Stow.....	48, 598
Saws.....	R. Cromelien.....	46, 996
Saws.....	E. S. Drake.....	47, 255
Saws.....	A. Dawes.....	48, 376
Saws.....	J. S. and C. N. Brown.....	50, 553
Saws.....	H. P. Dillingham.....	51, 385
Saws, Circular, Centring.....	W. T. and L. H. Rand.....	51, 478
Saws, Circular, Haing.....	W. R. Close.....	47, 597
Saws, Circular, on their arbors, Adjusting.....	J. Barnard.....	46, 325
Saws, Cross-cut, Attaching handles to.....	C. Diston.....	45, 980
Saws, Cross-cut, Attaching to their handles.....	D. Bearly.....	50, 676
Saws, files, &c., Tempering.....	J. Small.....	49, 451
Saws, Grinding and polishing.....	W. J. Lippincott.....	50, 606
Saws, Hand.....	D. Welch and W. W. Armington.....	50, 667
Saws, Pitman for.....	H. C. Elliauwod.....	51, 029
Saws, Sharpening.....	J. F. Tudor.....	49, 014
Saws, Sharpening.....	R. Sparks.....	46, 951
Saws, Sharpening.....	C. P. Frazer.....	51, 168

Shade, Lamp	C. Reichmann	49, 921
Shade, Lamp, Clasp for	G. L. Kelby	47, 734
Shade, Window	J. W. Ward and S. D. Wilson	51, 501
Shade, Window, Adjuster for	E. T. Higham	46, 050
Shade-holder for lamps	C. St. John	46, 534
Shade-holder for lamps	L. J. Atwood	47, 913
Shafting	F. P. Peregoy	47, 854
Shafting, Squaring the ends of, Tool for	L. Bronson	51, 133
Shafting, Universal	T. Welham	46, 166
Shank-cutting machine	S. D. Tripp	49, 456
Shank laster	J. and A. B. Cain	48, 052
Sharpener and fork, Combined	F. C. Beach	51, 285
Shears	G. Carter	47, 250
Shears, Cutting and grasping	S. W. Valentine	49, 178
Shears, Hand, or nippers	T. Wallis and T. Witbeck	46, 960
Shears, Pruning	J. Evans	48, 803
Shear poles to standing riggings, Attaching	E. Smith	50, 046
Shears for cutting iron bolts	G. W. Hyatt	47, 832
Shears for cutting metal	J. Hornig	46, 237
Shears for cutting metal	H. Barth	50, 325
Shears for cutting paper	C. Brombacher	48, 650
Shears for marking cattle	S. D. Baldwin	47, 785

Invention or Discovery.	Name of Patentee.	No.
Sheep, Holding, while being sheared.....	M. K. and L. P. Lewis	49, 636
Sheep, Shearing	M. C. Davis	45, 703
Sheep chair	O. Barker and G. E. Blakelee	49, 067
Shelf, Folding	G. W. Gillespie	51, 583
Shells, Explosive	E. Estabrook	45, 985
Shells, Explosive	B. B. Hotchkiss	47, 544
Shells, Explosive	H. W. Libbey	47, 651
Shells, Explosive	L. E. Williams	48, 005
Shells, Explosive	J. H. Hiscock	50, 535
Shells, Explosive, Compound	H. Barton	48, 642
Shells, Explosive, Submarine	W. W. W. Wood and J. L. Lay	47, 776
Shells, Explosive, Timing by clockwork	F. Toggenger	47, 586
Shells, Explosive, for ordnance	S. Wells	49, 326
Shells, Incendiary	W. W. Hubbel	50, 711
Shell and shot, Casting	T. J. Lovegrove	48, 022
Shells or torpedoes, Submarine, Operating	W. W. W. Wood and J. L. Lay	46, 853
Shields for breast strap	H. F. Willison	47, 485
Shifting gear	C. D. Rogers	45, 864
Shingles, Measuring and counting	M. Bonney	47, 697
Shingle machine	E. R. Morrison	46, 129
Shingle machine	I. N. Voris	47, 672
Shingle machine	S. E. Anthony	48, 885
Shingle machine	G. Challoner	49, 228
Shingle machine	J. A. Burnap and J. H. Melick	50, 900
Shingle machine	S. T. Sanford	51, 484
Shingle sawing machine	C. L. Pierce	47, 449
Ships, Iron	T. B. Daft	50, 767
Ships, Ventilating	O. D. Wells	51, 504
Ships, Stem and dead wood of, Framing	J. W. Griffiths	51, 307
Ship building	J. W. Griffiths	51, 308
Ships' bottom, Coating, Composition for	C. M. Spooner	49, 567
Ships' galley	W. Young	46, 313
Ships' lights, Closing	E. S. Hidden	51, 718
Ships and other vessels, Cooling and ventilating	D. E. Somes	46, 593
Ships and other vessels, Cooling and ventilating	D. E. Somes	48, 457
Ships of war	C. Slater	47, 463
Shirt bosoms	J. Neil	46, 487
Shirt bosoms	D. T. French	49, 027
Shirt bosoms, Paper	W. E. Lockwood	46, 567
Shirt bosoms, Paper	J. B. Gardiner	49, 747
Shirt bosoms, Metallic	L. Billou	49, 703
Shirt and braces, Combined	W. H. Towers	50, 289
Shoes	J. B. Johnson	46, 299
Shoes	D. Brown and W. S. Wooton	49, 076
Shoes	J. L. Joyce	49, 415
Shoes	F. Weed	50, 057
Shoes, Brake	J. Christy	49, 948
Shoes, Fastening for	C. Burchardt	49, 854
Shoes, Sewed	H. Dunham, jr.	50, 462
Shoes, Sewed, Machine	E. Thompson and R. Mars	48, 113
Shoes, Turned	G. McKay and L. R. Blake	47, 770
Shoe-edge burnishing machine	N. S. Thompson	50, 856
Shoe fastening	C. B. Hatfield	47, 356
Shoe fastening	J. Adams	49, 061
Shoe lacing	M. Bray	47, 513
Shoe lacing	T. J. Kelleher	50, 008
Shoe lacings, Knitting	N. W. Westcott and H. G. Walcott	48, 878
Shoe-shanking machine	W. H. Kimball	46, 805
Shoe string	W. H. Towers	46, 408
Shoe soles, Voltaic	T. Hall	46, 234
Shoes soled by sewing machines, Registering the number of	A. J. Tewksbury	50, 642
Shoes and soles, Heating	F. Winslow	50, 866
Shot and shell, Casting	T. G. Lovegrove	48, 022
Shoulder-strap slide	G. D. Kellogg	47, 968
Shovels, Grain	E. P. Williams	49, 330
Shovels, Sitting	J. P. Buckland	49, 370
Shovels, Sifting, Ash	A. M. Olds	49, 781
Shovels, Snow	D. M. Thayer	50, 050
Shovel and ash sifter, Combined	R. Schnap, jr.	46, 946
Show cards, Ornamenting	F. B. Scott	49, 444
Show cases for cigars and tobacco	C. E. Brown	48, 152
Shutters, Window	W. H. Kennard, jr.	49, 632
Shutter case	J. Ingram	49, 411
Shutter fastening	J. Frick	47, 711
Shuttles, Bobbin, Securing	S. C. Mendenhall	49, 643
Shuttles, Loom, Operating	D. Bickford	51, 006
Shuttles, Tating	J. S. Warner	50, 970
Shuttle hinge and fastening	W. S. Gerard	50, 239
Shuttles for looms	W. Wilder	46, 040
Shuttles and spools of sewing machines, Delivery of thread from	W. Weiting	46, 513
Shutters, Closing and opening	G. G. Morton and E. Lamasure	40, 909
Sieve	S. V. Gifford	50, 465
Sieve for separating outs from wheat	J. H. Mather	51, 334

Spinning, Bobbin holder for.....	J. Goulding.....	50, 241
Spinning, Bobbin holder.....	E. Wright.....	50, 311
Spinning, &c., Rolls for preparing fibrous material for.....	D. Read.....	48, 134
Spinning, Self-acting mules for.....	A. H. Cunnock.....	49, 861

Invention or Discovery.	Name of Patentee.	No.
Spinning bobbins	W. Murdock	51, 340
Spinning frames, Self-lubricating spindle bolsters of	S. T. Bartlett	47, 271
Spinning frame, Self-oiling spindle bolsters for	W. F. Rippon and T. R. Robinson	45, 752
Spinning frames, Upper bearings or bolsters for spindles of	M. D. Drake	47, 195
Spinning jack	H. L. Moulton	50, 024
Spinning jack	A. and G. Simpson	50, 044
Spinning machines	T. Pye	46, 386
Spinning machine	J. Rich	46, 588
Spinning machine	W. Eberhard	48, 917
Spinning machine	J. Eaton	49, 988
Spinning machine	J. Byrkit	50, 094
Spinning machines, Paper cop tube for	M. Hullings	51, 054
Spinning machines, Thread guides for	W. J. Innis	50, 204
Spinning rollers	E. D. Hurst	45, 718
Spirits, Distilling	I. and G. S. Goodspeed	46, 896
Spirits and other distillates, Measuring and testing	A. Krenslor and W. T. Pelton	50, 876
Spirits and other liquids, distilling	E. Payne	46, 058
Spirometers	F. Haeck	51, 403
Spittoons	A. P. Barnes	51, 002
Spittoons for dental chairs	L. W. Barget	49, 493
Spittoon and foot warmer, Combined	W. W. Butler	51, 552
Splitting and skiving machine	G. B. Clarke	47, 280
Spoke, Tenoning	W. S. Marsh	48, 964
Spoke machines	L. A. Dole	50, 768
Spoke shave	J. Foster	49, 341
Spoke in wagon wheels, Setting	S. S. Mowry and A. G. Bates	51, 339
Sponge, Preparing, for stuffing, padding, &c	R. Walker	51, 765
Spool, Heads to, Fastening the	A. F. Moith	48, 970
Spools, Jack	L. N. Parks	47, 658
Spools for winding yarn for beaming	D. R. Day and J. G. Folsom	4, 507
Spools and shuttles of sewing machines, Delivery of thread from	B. Saunders	50, 392
Spoon	W. Weetling	46, 513
Spoon, Ear, knife, and tweezer combined	R. Humphrey	46, 907
Spoon, Invalid	R. C. English	50, 106
Spoon, knife, and fork-holder	D. J. Pearson	51, 748
Spoon, Metal, Sheet	G. L. Morse and L. Herrick	46, 692
Spoon, Metal, Sheet	J. Fellows	48, 164
Spouts, Funnel, Corrugated	J. Fellows	49, 471
Spouts, Sap	J. Walton	46, 162
Spout or tubes, Metallic	A. Leitch	48, 961
Spout and strainer, Combined	E. Valentine and M. T. Rider	49, 045
Spring	W. Polyblank	49, 650
Spring	T. Shaw	47, 663
Spring	J. C. Plumer	49, 786
Spring, Bumper	R. Livingston	45, 927
Spring, Car	A. Buchanan	45, 696
Spring, Car	W. Cox	45, 815

Spring, Car	R. Vose	51, 368
Spring, Car, Railroad	W. F. Converse	49, 086
Spring, Carriage	A. J. Ritter	48, 444
Spring, Carriage	H. H. Olds	49, 545
Spring, Carriage	A. Selkirk	50, 209
Spring, Carriage, braces for	T. Taylor	50, 836
Spring, Coiling	C. C. Gleason	50, 114
Spring, Coupling, Gum-elastic	G. L. Turner	47, 882
Spring, Elastic, Straightening	S. M. Hoover	47, 305
Spring, Furniture	J. W. Gray and C. H. Curtis	46, 421
Spring, Main, of watch, Contracting barrels of	W. C. Wyckoff	51, 644
Spring, Rubber, for wagons	A. S. Clackner	49, 978
Spring, Spiral	S. G. Clough	51, 697
Spring, Steel, Tempering	F. C. Payne	50, 622
Spring, &c., Steel, Tempering, Compound for	W. Hughes	49, 108
Spring, Window	L. W. Kelley	51, 728
Spring, Wire, Flat	E. K. Breckenridge	46, 874
Spring, Volute	H. Kellog	50, 420
Spring bed-bottoms	J. Freeland and D. Ward	46, 655
Spring bolt-catch	G. E. Lord	46, 119
Spring catch for doors	G. M. Norris	47, 741
Spring horse	J. C. Plumer	46, 697
Spring punch	H. F. Metzler	46, 529
Spring slat for bed bottoms	P. Bauer	49, 364
Spring for bedsteads	J. M. French	51, 443
Spring for furniture	D. Manuel	51, 516
	D. Hawkins	50, 471

Invention or Discovery.	Name of Patentee.	No.
Spring for upholstering purposes	W. H. Mallory	49, 476
Sprues, Moulders'	M. R. Howell	45, 716
Spur carrier, boot drawer, and pantaloons guard, Combined	E. P. Watson	45, 776
Spurring or driving horses	J. Davis	50, 803
Square, Carpenters', Indicating	H. K. Jones	46, 191
Square, level, compass, and plumb staff, Combined	J. R. Abbott	51, 675
Square, rule, cutter, blotter, and paper weight, Combination of	A. H. Trego	50, 404
Square, Try	J. Williams	49, 670
Stacker, Chaff and straw	W. H. Loomis	46, 918
Staging for buildings	W. Arronquier	47, 179
Staging for building purposes	E. D. Walker	49, 017
Stair-rod	W. F. Mersereau	48, 825
Stair-rod	H. M. Hoover	49, 270
Stair-rod fastening	H. Jackson	47, 422
Stake, Attaching to railroad cars	J. Fortune	51, 277
Stalk, Cutting	J. B. Ryder	48, 312
Stalk and stubble in field preparatory to ploughing, Cutting	G. W. Wilson	51, 507
Stamp, Cancelling	J. W. Foster	45, 708
Stamp, Cancelling	M. P. Norton	49, 432
Stamp, Hand	G. J. Hill	45, 893
Stamp, Hand	T. S. Hudson and A. Hardy	48, 338
Stamp, Hand	H. Holt	48, 624
Stamp, Hand	D. H. Chamberlain	49, 084
Stamp, Hand	S. J. Smith	49, 452
Stamp, Hand	A. Jones	50, 715
Stamp, Hand, Composition for preparing ribbons for	H. Holt	47, 494
Stamp, Hamp, and canceller	J. B. Secor	50, 501
Stamp, Hand, and embossing press	W. Burrows	50, 556
Stamp, Hand, for printing	D. H. Chamberlain	46, 076
Stamp, &c., Inking	C. M. Wetherill	49, 038
Stamp, Ore-crushing	H. I. Behrens	50, 326
Stamp, Ore-crushing	E. Dart	50, 342
Stamp, Postage	G. W. Bowlsby	51, 782
Stamp, Postage and revenue	S. W. Francis	48, 389
Stamp, Postage and revenue	C. S. Wells	50, 058
Stamp, Postage and revenue, Cancelling	T. S. Hudson	51, 053
Stamp, Revenue	R. L. Smith	47, 464
Stamping machines, and spring and weight piston engines	E. F. McFarland	51, 737
Stanchions, Cattle	H. Maycock	45, 728
Stand, Flower	P. B. Sheldon	47, 664
Stand, Milk	A. R. Titus	49, 321
Stand, Music	J. David	50, 460
Stand, Photographic-camera	H. Manger	48, 193
Stand, Sirup, for soda fountain	C. M. Berry and C. C. Sheldrake	49, 335
Stand, Work, Ladies'	J. B. Atwater	48, 888
Stand for ladies' cloaks	J. R. Palmenberg	48, 989
Stand for ladies' figures	J. R. Palmenberg	49, 145
Stand for latches	H. D. Stover	50, 510
Stand for preserve jars	K. E. Ashley	50, 674
Starching and glazing cords, braids, &c.	D. McInroy	51, 471
Staves, Cutting	H. M. Shaw	46, 149
Staves, Cutting	J. I. Ralya	50, 782
Stave-cutting machine	M. Randolph	48, 028
Stave machines	J. W. Bowers	46, 068
Stave machines	C. G. Dibble	46, 548
Stave machines	P. Wernum	48, 468
Stave machine	G. R. Hay	48, 486
Stave machine	J. S. Thompson	49, 330
Steak mangle	J. P. Dorman	49, 245
Steam, Blowing off	P. Taltavull	49, 318
Steam-heating and fire-extinguishing apparatus	C. S. Brown	46, 328
Steel	S. W. Young	49, 050
Steel	J. Baur	49, 495
Steel, Articles of, Sharpening and hardening	W. Rowland	51, 087
Steel, Bessemer, Gun barrels, &c., from	J. Thompson	51, 281
Steel, Cast, Making	S. W. Wood	46, 041
Steel, Hardening and tempering	E. Savage and H. Stratton	48, 213
Steel, Manufacture of	E. P. Hudson	45, 828
Steel, Manufacture of	J. Baur	47, 510
Steel, &c., Manufacture of	R. Mushet	49, 487
Steel, Manufacture of	J. Deby, A. Trippel, and E. Gaussoin	50, 804
Steel, Refining and hardening	H. Roscoe	50, 039
Steel and iron	H. Bessemer	49, 051
Steel and iron	H. Bessemer	49, 052
Steel and iron	H. Bessemer	49, 053
Steel and iron	H. Bessemer	49, 055
Steel and iron	C. Sanderson	50, 084
Steel and iron, Bars, Shafts, and other articles of	J. D. Whelpley and J. J. Storer	50, 976
Steel or iron, Cast, Uniting with wrought or cast iron surfaces	H. Bessemer	51, 399
Steel and iron, Malleable	H. Bessemer	51, 400
Steel and iron, Malleable	H. Bessemer	51, 401
Steel and iron, Manufacture of	G. Parry	47, 506
Steel and iron, Manufacture of	J. Henderson	50, 474

Thill holder, Metallic	E. Brown	47, 765
Thill tug	W. H. Noyes	47, 903
Thill tug	T. Neely and C. Bishop	50, 615
Thills to carriages, Connecting	B. E. Sampson	48, 313
Thills to carriages, Coupling	D. C. Breed	45, 812
Thimble, Stove-pipe	T. M. Losie	46, 369
Threshing machine	O. Holmes	46, 108
Threshing machine	S. E. Oviatt	47, 326
Threshing machine	N. Palmer	47, 746
Threshing machine	C. B. W. T. Brown	48, 047
Threshing machine	S. Spencer	48, 108
Threshing machine	B. H. Kepner	49, 563
Threshing machines	H. Read	49, 551
Threshing machines, Band cutter for	W. U. Hoover	48, 279
Threshing machines, Band cutter and feeder for	W. U. Hoover	46, 905
Threshing machine, Feeding	E. Valentine and M. T. Rider	49, 044
Threshing machines, Swinging gear for	J. Kline and V. Becker	45, 838
Threshing machine and straw cutter, Combined	D. Kaufman	46, 474
Threads, &c., Dressing and finishing	E. Burgoyne and L. Guillermi	46, 314
Threads, Finishing	T. Kohn	48, 988
Threads, silks, &c., Dressing	J. Day	49, 240
Threads, Spooling	A. B. Glover	50, 575
Threads, tape, ribbons for use, Arranging	M. B. Westhead	50, 318
Threads, Winding, from the skin	J. Crutchett	45, 953

Invention or Discovery.	Name of Patentee.	No.
Thread from shuttles and spools of sewing machines, Delivery of the.	W. Weitling.	46, 513
Ticket, Railroad, Identifying.	A. S. Chittenden.	47, 798
Ticket boxes.	E. Hamburger.	48, 274
Ticket holder.	V. G. Arnold.	46, 519
Ticket holder, Railroad.	J. O. Harris.	46, 469
Tide, Producing motive power by the vertical rise and fall of the.	A. W. Scharit.	45, 867
Tiles, Dressing.	J. Reilly.	51, 219
Tile and brick machine.	B. F. St. John and H. Horst.	50, 508
Timber, Preserving.	A. Hamar.	51, 528
Timber, Splicing.	H. M. Claflen.	47, 395
Time detectors, Watchmen's.	J. E. Buerk.	48, 048
Time indicators for railroad trains.	J. C. S. Fitzpatrick.	46, 787
Time-keepers.	J. Stephenson.	47, 998
Timepieces, Escapements for.	D. J. Mozart.	46, 576
Timepieces, Globe.	T. R. Timby.	47, 584
Timepieces, Universal.	W. B. Purdy.	46, 496
Timepieces, Universal.	A. H. Hall.	47, 065
Time reporters.	T. Ascherfeld.	47, 266
Timing of explosive shells by clockwork.	F. Toggenburger.	47, 586
Tires, Shrinking.	C. V. Slatler.	45, 872
Tires, Shrinking.	C. Weitman.	51, 636
Tires, Upsetting.	A. Stedman.	48, 110
Tires, Wagon, Upsetting.	G. Huntington.	48, 245
Tiro fastener.	R. Hatrick.	47, 718
Tire-upsetting machine.	H. L. Howard.	51, 456
Toaster and boiler.	T. C. Law.	51, 064
Toasters or boilers, Wire.	H. A. Hildreth and W. J. Johnson.	47, 302
Tobacco.	H. D. Smith.	46, 826
Tobacco, Baling for packing.	J. H. Stone.	50, 047
Tobacco, Curing.	W. W. Huse.	48, 689
Tobacco, Curing.	P. Rauch.	46, 387
Tobacco, Cutting.	L. Planer.	46, 620
Tobacco, Cutting.	W. W. Huse.	46, 908
Tobacco, Cutting.	F. R. Ritterhoff, C. A. Colquitt, and W. Mulchahey.	47, 131
Tobacco, Cutting.	H. A. Morse.	47, 742
Tobacco, Cutting.	W. J. Stratton and H. G. Tideman.	49, 317
Tobacco, Drying.	J. H. Balsley.	46, 323
Tobacco, Granulating.	J. H. Harris.	48, 680
Tobacco, Pressing.	J. D. King.	48, 955
Tobacco dryer.	W. H. Pease.	48, 306
Tobacco paper.	H. J. Hall.	46, 233
Tobacco-smoke purifier.	J. Bavier.	46, 989
Tobacco stopper.	J. M. Brown.	46, 211
Toe-piece for lasting machine.	A. S. McIntire and N. S. Thompson.	46, 375
Tongs, Blacksmiths'.	C. W. Le Count.	50, 603
Tongs, Fire.	B. Holly.	50, 584
Tongs, Gas-fitters'.	A. B. Lipsey.	49, 424
Tongs, Grapple, for oil wells.	O. B. Latham.	51, 325
Tongs, Pipe.	D. C. Stillson and J. C. Chapman.	50, 748
Tonic bitters.	I. Hellman.	47, 204
Tools.	A. W. Park.	48, 027
Tools, Expanding.	J. Critchley.	51, 563
Tool holder, adjustable.	C. P. Benoit.	46, 438
Tool stock.	W. W. Draper.	48, 763
Tool for drawing spikes.	G. Stone.	46, 154
Top, Spinning.	L. Cramer.	45, 816
Torpedoes.	H. Holden.	49, 474
Torpedoes, Discharging.	W. W. W. Wood and J. L. Lay.	46, 851
Torpedoes, Exploding, in artesian wells.	E. A. L. Roberts.	47, 458
Torpedoes, &c., Operating.	J. L. Lay.	46, 850
Torpedoes, Submarine, Carrying and exploding.	W. W. W. Wood and J. L. Lay.	46, 852
Torpedo room.	E. R. Chamberlain.	48, 260
Torpedoes for oil wells.	J. F. Boynton.	49, 706
Torpedoes for oil wells.	A. T. Ballantine.	50, 324
Torpedoes or shells, Submarine, Operating.	W. W. W. Wood and J. L. Lay.	46, 853
Toy.	H. C. Ketcham.	47, 552
Toys, Composition for manufacturing of.	R. Borchardt and H. Bergman.	51, 009
Toy, Dancing.	J. M. Cromwell.	46, 997
Toys, Dolls' heads and other, Constructing.	L. E. Sallee.	46, 270
Toy blocks.	S. L. Hill.	51, 720
Toy block, Mosaic.	T. G. Harrold.	46, 525
Toy spring-gun.	A. Hall.	47, 815
Traces, Attaching to whiffletrees of vehicles.	E. Brown.	50, 682
Trace connection.	J. E. Seavey.	47, 366
Trace fastener.	D. H. Cloek and F. D. Ryan.	51, 425
Trace fastening.	D. E. Holmes.	50, 585
Trace lock.	J. B. Shaw.	46, 590
Trace trimmer.	W. L. Hutchinson.	49, 110
Trace to whiffletrees, Attaching.	E. Calderwood.	48, 364
Tracks, Car, Railway.	D. H. Dotterer.	49, 510
Tracks, Car, Raising.	J. Temple.	51, 523

Invention or Discovery.	Patentee.	No.
Track clearer, Railroad	G. C. Sharp	50, 634
Track layer, Automatic	J. L. Nichols	47, 033
Tracks for railroads	A. C. Beach	49, 698
Trains, Railway, Supplying with water	L. H. Lezott	50, 013
Tram-way for ferry-boats	N. W. Wheeler	47, 479
Training the muscles in writing	E. G. Squires	46, 827
Traps, Animal	W. S. Gitchell	46, 557
Traps, Animal	J. Wheelock	46, 741
Traps, Animal	G. W. Pagett	47, 563
Traps, Animal	W. F. Caswell	48, 905
Traps, Animal	J. W. Churchill	49, 378
Traps, Animal	A. Edwards	49, 735
Traps, Animal	L. J. Baker	51, 283
Traps, Animal	B. F. Sanford	51, 356
Traps, Animal	S. Knight	51, 463
Traps, Animal	G. E. Clark	51, 777
Traps, Animal, Self-setting	H. B. Myers	46, 379
Traps, Bed bug	W. Tapper	51, 493
Traps, Bird	R. Rex	49, 923
Traps, Box, for animals	B. B. and J. R. Hill	46, 356
Traps, Coal, Safety	T. W. Pratt	50, 387
Traps, Fly	D. Lake	45, 839
Traps, Steam	L. W. Woodward	46, 416
Traps, Steam	J. C. and G. Shackleton	46, 825
Traps, Steam	P. Hogg	47, 304
Traps, Steam	J. W. Bishop	47, 181
Traps, Steam	L. H. Thomas	49, 174
Treadle for operating machinery	J. J. Kimball	45, 837
Treadle motion	A. L. Dewey	47, 282
Trees, Disease in, Remedy for	H. Funnell	47, 099
Trees, Fruit, &c., Preventing insects from injuring	C. Fisher	49, 869
Trees, Protecting, from injury while ploughing	R. Alden	46, 616
Tree protectors	T. Hilton	46, 298
Tree protectors	A. T. Ring	48, 838
Tree protectors	L. Sanford	49, 440
Tree protectors	J. C. Starbuck	49, 453
Tremolo attachment	R. W. Carpenter	48, 386
Trimnings, Fluting	S. Totten	46, 157
Troughs, Eave	F. J. Emery	46, 093
Trough for raising dough	H. S. McKean	46, 688
Trucks, Car	E. Thurston and J. R. Ledyard	47, 880
Trucks, Car	C. H. Hall	49, 400
Trucks, Car	C. F. Jauriet	50, 594
Trucks, Car, Frames for	D. B. Rogers	47, 863
Truck, Car, Keybolt connection of	J. J. Sherman	49, 163
Trucks, Car, Railroad	C. Schouberszky	46, 316
Trucks, Car, Railroad	J. P. Laird	51, 063
Truck irons, Bending and punching	P. L. Weimer	50, 753
Truck for pulling stones	G. L. Sheldon	48, 315
Trunks	J. H. Whitfield	50, 059
Trunks, Roller cleat for	J. A. Lieb and J. Schmadel	47, 117
Trunk caster	W. O. Headley	48, 937
Trunk stays	J. M. Dailey	47, 092
Trusses	C. W. Botzell	47, 612
Trusses	S. S. Ritter	49, 437
Trusses	R. E. Downie	51, 108
Trusses, Car, Railroad	J. F. Keeler	45, 834
Tub for washing and other purposes	J. Danner	46, 085
Tubes, Boring	A. Wyckoff	51, 252
Tubes, drills, &c., Extractor of, from oil wells	W. R. Hinsdale	49, 628
Tubes, Draught, for soda water apparatus	F. A. Weber and W. H. Greene	46, 284
Tubes, Inhaling	C. Bullock	48, 789
Tubes, Lap-welded, Finishing	P. L. Weimer	50, 781
Tubes, Metallic	E. Valentine and M. S. Ridout	46, 311
Tubes, Oil well, Packing for	C. L. Noe	49, 544
Tubes, Oil well, Packing for	J. Parham, jr	49, 783
Tubes, Packing, for oil well	G. E. Mills	49, 778
Tubes, Well, Deep	H. R. Koon	49, 418
Tubes, Well, Deep, Sinking	H. R. and M. T. Barnes	49, 362
Tubes, Well, Packing for	P. Sicouret	49, 599
Tubes, Well, Sinking	C. W. Kinne	50, 142
Tube expander	J. H. Knickerbocker	49, 765
Tube packing	S. L. Fox	45, 822
Tube sheet cutter	D. E. Rice and W. Evered	47, 983
Tubes from wells, Withdrawing	W. H. Downing	47, 194
Tubes for caves in oil or other wells	J. A. Patterson	46, 818
Tubes of boilers or condensers, Packing	J. Newkirk	49, 295
Tubes of sheet metal, Forming	M. G. Wilder	47, 888
Tubes or pipes for wells	T. Dutton and T. Maguire	50, 343
Tubes or spouts, Metallic	E. Valentine and M. T. Rider	49, 045
Tubes to boilers, Sealing, Tool for	J. Daley and J. H. Marvill	46, 339
Tubes and pumps for wells	J. H. Bump	51, 136
Tubing, Flexible	E. P. Glenison	46, 558
Tubing, Flexible	D. K. Hoxie and T. L. Reed	51, 052

Invention or Discovery.	Name of Patentee.	No.
Tubing, Flexible, for illuminating gas.....	W. B. S. Taylor.....	46, 507
Tubing, Metal, Sheet.....	S. M. Cate.....	51, 017
Tubing tanks, roofing, wainscoating boats, and other structures, Material for.....	J. K. Mayo.....	51, 735
Tumblers, pitchers, &c.....	G. G. Percival.....	48, 996
Tumblers, Washing.....	B. Hart.....	48, 934
Tunnel and scale pan.....	A. A. Smith.....	50, 636
Tunnelling and mining machine.....	H. Haupt and J. Y. Smith.....	47, 168
Turn-table, Railroad.....	J. I. Kiugsley.....	51, 192
Turpentine, &c.....	A. H. Emery.....	49, 249
Turpentine, Spirits of.....	J. Johnson.....	50, 132
Turpentine, Spirits of, oil, resin, and other products from pine wood, Obtaining.....	A. H. Emery.....	46, 092
Turpentine and other products from resinous wood, Extracting.....	D. Hull.....	48, 406
Turrets, Monitor, Raising by hydraulic pressure.....	S. Wilmarth.....	51, 378
Turrets and guns, Operating.....	J. B. Eads.....	46, 223
Tuyere.....	J. R. Harrington.....	46, 526
Tuyere.....	D. S. Lay.....	48, 963
Tuyere.....	W. P. Cain.....	51, 692
Tuyere, Adjustable.....	B. G. Noble.....	48, 974
Tuyere, Forge.....	R. Patt.....	48, 998
Tweezer, knife, and ear spoon, Combined.....	B. C. English.....	50, 107
Tweezer and screw-driver.....	D. F. Hartford.....	47, 102
Twine, Paper.....	J. P. Tice.....	46, 405
Twine, Paper, Manufacture of.....	E. B. Bingham.....	46, 208
Type, Flexible, and apparatus for printing.....	H. Tubessing.....	47, 262
Type, Photo-electro.....	W. A. Leggs and G. E. Desbarats.....	48, 035
Type, Printing, Scrip.....	H. J. Hewitt.....	50, 245
U.		
Umbrellas.....	J. S. Fee.....	48, 267
Umbrellas.....	G. L. Peabody.....	49, 912
Umbrellas.....	W. Damerel.....	49, 986
Umbrellas.....	H. Hotchkiss.....	50, 587
Umbrellas.....	J. H. Parsons.....	51, 616
Umbrellas, &c., Inserting glass in.....	E. A. Pond and M. S. Richardson.....	50, 492
Umbrella holders.....	J. A. Minor.....	50, 261
Uterine supporters.....	S. L. Hockert.....	49, 406
V.		
Valise, Saddle.....	R. McMurray and J. S. Topham.....	47, 028
Valise, Travelling.....	F. W. Lamour-ux.....	49, 896
Valise for artillery harness.....	W. H. Wilkinson.....	47, 889
Valise and seat, Combined.....	S. B. Holden.....	46, 187
Valve.....	D. D. Allen.....	48, 883
Valve, Automatic, for steam radiators.....	J. P. Wood.....	47, 240
Valve, Balance plug.....	S. Smith and B. Pickering.....	51, 329
Valve, Balance puppet.....	R. C. Bristol.....	50, 443
Valve, Balance slided.....	C. E. Emery.....	47, 284
Valve, Core.....	G. Shield.....	50, 394
Valve, Cut-off.....	W. McClintock.....	50, 304
Valve, Cut-off.....	J. L. Albertson.....	50, 320
Valve, Cut-off, for steam engines.....	H. O. Perry.....	46, 932
Valve, Escape, for pumps.....	E. A. Floyd.....	48, 543
Valve, Globe.....	W. Chesley.....	50, 219
Valve, Governor.....	O. L. Brown.....	48, 652
Valve, Governor.....	C. W. Le Count.....	49, 422
Valve, Governor.....	R. W. Gardner and J. Robertson.....	51, 037
Valve, Governor, for steam engines.....	S. Mills.....	48, 969
Valve, Lock, for canal gates.....	J. Jerome and L. K. Cole.....	47, 643
Valve, Oscillating.....	G. Davis.....	45, 910
Valve, Pump.....	C. B. and J. Hardick.....	51, 653
Valve, Safety.....	J. Y. Smith.....	47, 869
Valve, Safety, Operating.....	W. S. Hudson.....	46, 238
Valve, Safety, for spring balances.....	T. S. Ray and S. E. Cleveland.....	51, 350
Valve, Safety, for steam generators.....	S. G. Barker.....	49, 068
Valve, Safety, for steam generators.....	R. Wood.....	50, 376
Valve, Slide.....	S. Nowland.....	51, 610
Valve, Slide.....	C. C. H. Brightly.....	46, 991
Valve, Slide.....	J. B. Cochrane.....	47, 932
Valve, Slide.....	J. G. Ives.....	48, 070
Valve, Slide.....	J. A. Woodbury.....	48, 611
Valve, Slide.....	A. Buchanan.....	50, 231
Valve, Slide.....	S. D. White.....	50, 527
Valve, Slide, Balanced.....	H. Spangler.....	50, 746
Valve, Slide, Balanced.....	A. S. Cameron.....	48, 901
Valve, Slide, Balanced.....	J. Rankin.....	47, 453
Valve, Slide, Balanced.....	J. Rowbotham.....	51, 393
Valve, Slide, for steam engines.....	S. F. Hodge.....	49, 267
Valve, Slide, for steam engines.....	G. Thackeray.....	50, 750
Valve, Slide, for steam engines.....	C. W. Crawford.....	51, 023
Valve, Slide, for steam engines.....	A. W. Jones.....	51, 656

Invention or Discovery.	Name of Patentee.	No.
Valve, Steam	J. Johnson	49, 414
Valve, Steam regulator	G. H. Fox	48, 166
Valve, Steam, or water	C. E. Ricker	51, 221
Valve, Stop	J. McClelland	46, 571
Valve, Stop	E. Andrews	51, 533
Valve, Stop, Refitting	S. Wing	49, 203
Valve cocks	W. Chesley	46, 077
Valve cocks, Globe	F. Luinkenheimer	46, 685
Valve cocks, Steam, Screw	S. D. Fales	47, 097
Valve gear, Cut-off	K. H. Loomis	49, 284
Valve gear, Throttle	H. W. Warner	48, 120
Valve gear for direct-acting steam engines	W. H. Guild and W. F. Garrison	51, 454
Valve gear for oscillating engines	H. T. Carter	48, 904
Valve gear for steam engines	C. E. Gage	47, 492
Valve gear for steam engines	J. W. Maloy	48, 418
Valve gear for steam engines	A. S. Cameron	50, 218
Valve gear for steam engines	J. S. Barden	50, 414
Valve gear for steam engines	W. H. Stanton and A. D. Spencer	50, 966
Valve regulators, Safety	P. Riodan	46, 142
Valve spindles, Stuffing boxes for	T. and J. Barber	48, 147
Valve for faucets, Stop	W. Krull	49, 894
Valve for steam engines	O. T. Earle	45, 820
Valve for steam engines	J. E. Thorpe	47, 072
Valve for steam engines	A. Morton	47, 122
Valve for steam engines	J. W. Carhart	48, 902
Valve for steam engines	T. Clark	49, 858
Valve for steam engines	C. W. Tremain	50, 050
Valve for steam engines	E. Rogers	50, 389
Valve for steam engines	W. M. Henderson	51, 314
Valve for steam hammers	J. Watt	50, 407
Valve for steam pipes	S. R. Warner	47, 073
Valve for steam pipes	A. R. Treadway and S. R. Warner	47, 057
Valve for steam radiators	F. Presser	49, 918
Valve for submarine ordnance	J. F. Cleu	46, 080
Vapors, Antiseptic, Impregnating the air of rooms with	A. J. Sax	48, 352
Vapors, Inhaling	A. P. Lighthill	47, 434
Vapors, Noxious, Disinfecting	W. Adamson	46, 317
Vapor inhalers	D. Russell	50, 735
Varnish, &c., Composition for	P. Prescott	46, 024
Vegetables, Cutting and reducing	T. J. Sloan	48, 316
Vegetables, Disease in, Composition for preventing	J. B. Tribble	46, 957
Vegetables, &c., Extracts from, Obtaining	C. Chilcott	47, 393
Vegetables, Skimming	O. Hase	48, 779
Vegetable slicer	T. Mason	48, 700
Vegetable washer	F. W. Bacon	48, 477
Vegetable washer	F. Arnold	50, 888
Vegetable or animal substances, Case for preserving during transportation	J. G. Staunton	45, 764
Vegetable and animal substances, Preserving	F. Stabler	50, 965
Vegetable and animal substances, Preserving	R. Jones	51, 280
Vehicles	Z. B. Wakeman	47, 473
Vehicles	O. E. Miles	49, 289
Vehicles, Breaching hooks for	E. Brown	48, 513
Vehicles, Tops of, Attaching and detaching	D. A. King and V. N. Gardner	47, 959
Vehicles, Whiffletrees of, Attaching traces to	E. Brown	50, 682
Velocipedes	W. Quinn	47, 220
Velocipede trotting or pacing horse	H. A. Reynolds	46, 705
Ventilating	H. A. Gouge	47, 633
Ventilating, heating and cooling	D. E. Somes	51, 226
Ventilating apparatus	E. Y. Robbins	48, 722
Ventilating apparatus for railroad cars	J. B. Talmadge	46, 831
Ventilating apparatus for steam vessels	J. G. Woodward	50, 434
Ventilating car windows	G. Mann, jr.	50, 831
Ventilating pads	J. P. McLean	50, 147
Ventilating railroad cars	T. H. B. Sanders	50, 960
Ventilating windows for railroad cars	R. Monroe, E. Stone, and E. St. John	51, 607
Ventilating and cooling dwellings, churches, hospitals, theatres, and other buildings	D. E. Somes	46, 596
Ventilating and cooling ships and other vessels	D. E. Somes	46, 593
Ventilator	B. J. Burnett	45, 814
Ventilator	P. Lear	46, 913
Ventilator	H. A. Gouge	47, 413
Ventilator	B. J. Burnett	50, 794
Ventilator, Centrifugal	A. P. Blake	46, 067
Ventilator, Hat	A. Komp	49, 767
Ventilator, Self-regulating	N. Hammond	46, 898
Ventilator, Stove-pipe and draught damper	G. G. Wolfe	46, 414
Ventilator for houses	B. J. Burnett	49, 373
Ventilator for ships	B. J. Burnett	49, 374
Ventilator and damper	J. H. Littlefield	49, 899
Vermn, Destroying, Compound for	J. B. Hyde	50, 006
Vessels	J. P. Curry	48, 795
Vessels, Centreboards for, Windlass for operating	J. C. and H. W. Hamilton	46, 351
Vessels, Decks of, roofs, &c., Applying coverings to	J. Hull	48, 060

Invention or Discovery.	Name of Patentee.	No.
Vessels, Deck and side lights for	C. Parley	45, 536
Vessels, Navigable connection of the gulf of the mast of	C. B. Fisher	47, 444
Vessels, Rig, Loading for	S. Cowan	45, 552
Vessels, Stowage for	D. Fields	51, 149
Vessels, Stowage, or other loading and unloading	D. L. Somes	46, 331
Vessels, Steam, Ejecting refuse matter from	J. Palmer	50, 541
Vessels, Steam, Ventilating apparatus for	J. G. Woodward	50, 434
Vessels, Sunk, Cargo of, Discharging the	P. E. Fulton	49, 156
Vessels, Sunk, Stowing	T. Bell	46, 335
Vessels, Sunk, Stowing	A. B. Page	48, 494
Vessels, Sunk, Stowing	C. W. Fuller	48, 142
Vessels, Sunk, Stowing, Self-discharge for	T. P. Edison	48, 169
Vessels, Sunk, Tug boat for	D. R. Arnold	47, 175
Vessels, for loading	W. Knepper	47, 425
Vessels, for loading petroleum	J. M. Bamberger	47, 316
Vessels, for loading petroleum	J. W. Barron and P. M. McNish	48, 492
Vessels, for preserving timber or other substances	J. G. Shannon	45, 763
Vessels, for the transport and transportation of night-soil	A. A. Smith	45, 247
Vessels, for	J. S. Underhill	46, 337
Vessels, and steamboats, Landing platform for	N. W. Wadner	47, 423
Vests	A. H. Brumhard	45, 693
Vests	J. Kenschaw	45, 522
Vests	C. B. Durr	45, 394
Vests	F. B. Curtis	49, 386
Vinegar	C. Wessner	50, 523
Vinegar	M. Baker	51, 159
Vinegar, Manufacture of	M. Bink	46, 241
Vinegar, Storage for	A. F. Brown	48, 448
Vulcanite, A tape of aluminum with, Combination of	N. C. Fowler	47, 147
Vulcanite or hard rubber	D. H. Furman	48, 492
Vulcanite and other materials, Aluminum with, Combining	N. C. Fowler	47, 226
W		
Wadding, Surface lining, &c., Machine for	S. Buxendell	46, 365
Wagons	J. David	47, 381
Wagons, Fwags, Handboards of, Stopping and unshipping	F. W. Bishop	49, 399
Wagons, Hay, Loading and unloading	S. Rogers	47, 445
Wagons, Hay-racks for	W. M. Thomas	47, 435
Wagons, Light	H. L. Schum	49, 130
Wagons, Spring seat for	T. J. Alexander	50, 735
Wagons, Tumbards of, Releasing the	C. Grover	49, 734
Wagons, unloading attachment for	J. E. Stevens	48, 106
Wagon boxes, Means of fastening	E. Conditine	50, 549
Wagon bells, Boring	F. Bremerman	51, 588
Wagon shaft shackles	E. Dickinson, Jr.	50, 545
Wagon-shackles	A. Fancher	51, 567
Wall brackets and other ornaments	A. W. Packer, Jr.	49, 547
Washboards, Soap-board	J. Eby	47, 137
Washboards, Wash and pour	J. B. Hyde	49, 476
Washing apparatus, Steam	C. A. Wilson	49, 332
Washing apparatus, Steam	C. A. Wilson	50, 554
Ways, Dressing and dressing	W. Foster and A. W. Sacklin	51, 582
Ways dressing and working, Expansion-resist for	A. J. Nichols	49, 384
Watchboards	N. Hester	47, 508
Watchboards	L. B. Hart	48, 541
Watchboards	J. S. Lash	49, 535
Watchboards, Attachment for	C. H. Warren and A. C. Baldwin	50, 434
Watchboards, Cutting Tool for	C. H. Hudson	46, 381
Watchers, direct	C. A. King and C. A. Smith	50, 600
Watching machine, &c., Apparatus for	J. McCalland	46, 375
Watching apparatus	S. S. Foss	50, 544
Watching apparatus	C. C. H. Glendon	49, 745
Watching apparatus	R. W. Chappell	49, 977
Watching frames	L. A. Alexander	50, 800
Watching machines	G. W. Sayre	49, 340
Watching machine	S. Gamble	49, 250
Watching machine	G. M. Boues	48, 175
Watching machine	O. Bremer	48, 265
Watching machine	E. Burke	46, 287
Watching machine	L. Martin	48, 460
Watching machine	W. H. Perry and W. Woodworth	49, 316
Watching machine	S. S. Putnam	47, 828
Watching machine	B. Wright	47, 662
Watching machine	J. H. Cook and E. S. Gould	47, 587
Watching machine	A. F. Latham	47, 630
Watching machine	J. T. Mudge	47, 445
Watching machine	E. Holbrook	47, 840
Watching machine	H. L. Beckman	47, 875
Watching machine	E. Culbert	47, 802
Watching machine	E. Brown	47, 924
Watching machine	D. Davidson	47, 874
Watching machine	J. Adams	48, 171
Watching machine	E. Douglas	48, 363

Invention or Discovery.	Name of Patentee.	No.

Watches, Winding and setting.....	C. E. Laederich.....	47, 370
Watches, Winding and setting.....	F. A. Giles.....	47, 412
Watches, Winding and setting.....	H. Rothfelder.....	48, 725
Watches, Winding and setting.....	F. A. Giles.....	49, 397
Watch escapement.....	G. P. Reed.....	49, 155
Watch escapement.....	L. Billou.....	51, 414
Watch mainsprings, Contracting barrels of.....	A. S. Clackner.....	49, 978
Watch regulator.....	G. P. Reed.....	49, 154
Watch safes.....	C. N. Devereux.....	49, 863
Water, Cooling, in wells.....	D. E. Somes.....	50, 399
Water apparatus, Portable.....	J. F. Rochow.....	48, 839
Water-boiling apparatus.....	H. W. Horton.....	50, 586
Water conductors, Cut-off for.....	J. Ash.....	49, 960
Water coolers and purifiers.....	A. J. Gibson and G. Emerson.....	46, 556
Water-fall head dress for ladies.....	P. Walter.....	46, 961
Wearing apparel, Clasps for.....	F. Wood.....	46, 288
Weather prophets.....	A. C. Rund.....	51, 477
Weather strips.....	A. M. Peniston.....	50, 480
Weather strip and stop.....	J. G. C. Horton.....	51, 049
Weaving button-holes in fabrics.....	I. J. Knowles.....	46, 679
Weaving fabrics with button-holes therein.....	J. Connor.....	47, 151
Weaving three-ply fabrics, Jacquard.....	J. S. Ferguson.....	46, 821
Weaving and warp dressing, Expansible reel for.....	A. J. Nichols.....	46, 384
Weighing apparatus.....	B. Churchill.....	49, 377
Weighing apparatus.....	O. S. Bliss.....	51, 416
Weighing attachment for penholders and pencils.....	D. A. B. Savy.....	49, 059

Invention or Discovery.	Name of Patentee.	No.
Weights, Hoisting and lowering.....	W. C. McGill.....	47, 969
Weight-lifting apparatus.....	D. P. Butler.....	48, 050
Weight-pulling apparatus.....	D. P. Butler.....	48, 051
Welding, Composition for.....	G. Harpst.....	50, 355
Wells, Artesian, Boring.....	T. J. Lovegrove.....	48, 343
Wells, Artesian, Boring.....	W. A. Fisher.....	48, 388
Wells, Artesian, Boring apparatus for.....	J. Theaker.....	50, 643
Wells, Artesian, Boring machine for.....	G. W. Wicks.....	48, 004
Wells, Artesian, Boring tools for.....	H. H. Daniels.....	47, 804
Wells, Artesian, Boring tools for, Operating.....	J. Ross.....	50, 777
Wells, Artesian, Drilling.....	S. J. Wadsworth.....	48, 605
Wells, Artesian, Operating.....	E. Huson.....	50, 934
Wells, Artesian, Packing for.....	S. Swartz.....	48, 599
Wells, Boring.....	C. E. Foster.....	46, 968
Wells, Boring.....	C. A. Saxe.....	47, 225
Wells, Boring.....	M. Campbell and J. H. Cole.....	48, 515
Wells, Boring.....	P. J. Hynes.....	51, 592
Wells, Boring, Devices for.....	J. Donnell.....	47, 400
Wells, Deep, Packing.....	A. H. Fowler and E. J. Morgan.....	51, 167
Wells, Deep, Packing for.....	F. Martin.....	49, 903
Wells, Deep, Packing of pistons in, Adjusting.....	E. D. Brown.....	50, 898
Wells, Deep, Piston packing for.....	C. H. Jackson.....	49, 759
Wells, Deep, Tubular apparatus for.....	M. J. Dickerson and J. Stuber.....	50, 919
Wells, Oil.....	G. T. Parry.....	48, 994
Wells, Oil, Deep, Elastic packing for the exterior of pumps in.....	J. Moulton.....	46, 860
Wells, Oil, Electro-magnets for.....	M. Knickerbocker.....	51, 729
Wells, Oil, Heating by electricity.....	G. T. Parry and S. S. Warner.....	48, 584
Wells, Oil, Operating.....	P. Casamajor.....	50, 902
Wells, Oil, Operating.....	P. Casamajor.....	50, 903
Wells, Oil, Packing for.....	J. R. Cross.....	50, 910
Wells, Oil, Packing tubes.....	R. A. Wilder.....	50, 194
Wells, Oil, Testing.....	J. C. Lyons.....	46, 124
Wells, Oil, Tool for removing obstructions in.....	W. Bowden.....	50, 896
Wells, Oil, Treating, to remove paraffine, tar, &c.....	J. Frazier.....	47, 410
Wells, Oil, and other, Tubes for caves in.....	J. A. Patterson.....	46, 818
Wells, Sinking.....	B. Mudge.....	50, 614
Wells, Sinking.....	R. H. St. John.....	50, 967
Wells, Sinking.....	E. Ashton and G. W. Galpin.....	51, 382
Wells, Sinking and tubing.....	G. D. Pettingill and L. H. Mericle.....	50, 949
Wells, Water in, Cooling.....	D. E. Somes.....	50, 399
Well borers.....	G. L. Witsill and E. Burke.....	46, 517
Well borers.....	W. Hyde.....	46, 673
Well-boring apparatus.....	J. Greives.....	48, 809
Well-boring apparatus.....	C. E. Foster.....	46, 420
Well-boring apparatus, &c.....	C. E. Foster.....	46, 844
Well-boring apparatus.....	H. Howson.....	46, 849
Well-boring devices.....	T. J. Parke.....	50, 881
Well tubes, Deep, Sinking.....	A. A. Wilson.....	47, 249
Welt machine.....	H. R. and M. T. Barnes.....	49, 362
Welt trimmer.....	B. U. Lyon.....	49, 349
Whales, Killing, Bomb-lance for.....	J. B. Reed.....	51, 519
Whales, Killing, Bomb-lance for.....	S. Barker.....	46, 437
Wharf, pier, and warehouse.....	E. Pierce.....	49, 548
Wheels.....	J. B. Hyde.....	49, 475
Wheels, Anti-friction, for belt gearing.....	J. Stollker.....	50, 425
Wheels, Car.....	D. Eldridge.....	49, 614
Wheels, Car.....	S. J. Seely.....	46, 145
Wheels, Car, Annealing.....	J. Harris.....	50, 579
Wheels, Car, Lubricating.....	H. W. Moore.....	51, 338
Wheels, Car, Railroad.....	W. Youmans.....	48, 230
Wheels, Car, Upon axles, Adjusting.....	J. D. Murphy.....	47, 780
Wheels, Carriage.....	H. Helm.....	50, 823
Wheels, Carriage.....	J. Goodman.....	46, 524
Wheels, Carriage.....	J. Raddin.....	48, 207
Wheels, Carriage.....	C. S. Winchester.....	51, 251
Wheels, Carriage, F-lloe-clamp and spoke-support for.....	J. Scott.....	51, 756
Wheels, Caster, Glass.....	J. C. Plumer.....	51, 620
Wheels, Corundum, Making.....	J. B. Capewell.....	50, 795
Wheels, Feed, as substitute for ratchets or pawls.....	E. H. Danforth.....	48, 160
Wheels, Fly.....	O. C. Phelps.....	47, 126
Wheels, Friction, and oil chamber.....	D. Eldridge.....	46, 890
Wheels, Paddle.....	A. J. Ambler.....	46, 867
Wheels, Paddle.....	B. G. Martin.....	48, 771
Wheels, Paddle.....	C. A. Kirkpatrick.....	48, 956
Wheels, Paddle, Feathering.....	W. Choate.....	50, 417
Wheels, Paddle, Feathering.....	J. A. Keene.....	45, 835
Wheels, Paddle, Feathering.....	A. Gilman.....	49, 102
Wheels, Paddle, Feathering.....	J. Burson.....	49, 226
Wheels, Paddle, Feathering.....	M. G. Collins.....	50, 338
Wheels, Paddle, Feathering.....	S. F. Gates.....	50, 702
Wheels, Paddle, Feathering.....	E. Haight.....	50, 817
Wheels, Propelling, for river and canal boats.....	H. Penton.....	48, 541
Wheels, Spinning.....	J. M. Flood.....	51, 532
Wheels, Friction, for rotary ploughs.....	L. S. Fithian.....	47, 005

Invention or Discovery.	Name of Patentee.	No.
Wheels, Wagon	J. M. Howe	48, 687
Wheels, Wagon	B. Pearson	51, 747
Wheels, Wagon, Dressing	S. T. Jackson	50, 130
Wheels, Wagon, Spokes in, Setting	R. Walker	51, 766
Wheels, Water	J. Sanford	45, 755
Wheels, Water	R. Stewart	45, 875
Wheels, Water	J. F. Letellier	46, 367
Wheels, Water	J. H. Wooster	46, 429
Wheels, Water	G. F. Wright	48, 613
Wheels, Water	S. J. Kindleberger	48, 694

Wheels, Water	J. A. and A. Allen	48, 781
Wheels, Water	H. Wenger	48, 855
Wheels, Water	L. S. Fairchild	48, 866
Wheels, Water	A. Jamison	49, 114
Wheels, Water	J. M. Clark	49, 380
Wheels, Water	C. D. Wright	49, 578
Wheels, Water	U. H. Goble	50, 928
Wheels, Water, Turbine	G. Talbot	51, 760
Wheels, Wind	L. Reese	47, 039
Wheels, Wind	H. O. Cook	49, 485
Wheels, Wind	J. E. Hubbard	50, 003
Wheels, Wind	A. H. Hanson	50, 705
Wheels, Wind	E. F. Hough	50, 825
Wheel for axles	C. J. Crane	50, 655
Wheels for the propulsion of vessels in shoal water	O. Olds	48, 715
Wheels and pulleys to shafts, Fastening	Z. Wheeler	50, 761
Wheelbarrows	N. C. Sanford	48, 101
Whiffletrees	J. Elder	48, 163
Whiffletrees	J. H. Littlefield	48, 416
Whiffletrees	T. B. Markillie	49, 285
Whiffletrees	I. D. Flanagan	50, 347
Whiffletrees	G. Woerber	50, 763
Whiffletrees, Rotating	C. C. Lee	51, 597
Whiffletrees, Snap-hook for	C. W. Saladee	51, 089
Whiffletree attachment	J. C. Gardner	51, 712
Whiffletree irons	W. M. Bryant	47, 894
Whiffletree rackets and neck yokes	C. C. Holman	50, 124
Whiffletree of vehicles, Traces to, Attaching	E. Brown	50, 682
Whip sockets	J. Lake	46, 680
Whip sockets	J. F. Brewer and T. E. Stow	47, 277
Whip socket fastening	H. W. Catlin	46, 215
Whiskey, Distilling and rectifying	E. F. Prentiss and R. A. Robertson	48, 436
Whistle, Steam	C. Kupferle and J. H. Ward	46, 910
Whistle, Steam	A. Fitts	48, 921
Whiting, Waste, Utilizing	H. W. Gray	49, 518
Wicks, Lamp	P. Noyes	51, 611
Wicks, Lamp, Trimming	H. F. Bond	45, 692
Wicks, Making	A. Menuci	46, 607
Wicks, Rendering, incombustible	E. P. Furlong and E. M. Lang	47, 100
Wick scraper	C. W. Cahoon	47, 254
Wick trimmer	C. L. Topliff	48, 743
Wicks of lanterns, Regulator for the	H. W. Bleyer	48, 254
Winders for oyster diggers	H. S. Lawson	46, 912
Windlass	P. H. Jackson and S. Eddy	46, 110
Windlass	W. C. McGill	46, 811
Windlass	P. H. Jackson	48, 282
Windlass, Screw, and capstan	H. Heitman and J. Radican	47, 104
Windlass for operating centre-boards for vessels	J. C. and H. W. Hamilton	46, 351
Windlass for tightening ships' standing rigging	J. G. Codmus	47, 164
Window	S. Wales	48, 749
Window	W. Maurer	49, 426
Window, Car, Ventilating	G. Mann, jr.	50, 831
Window, Double	T. S. Lambert	47, 837
Window, Ventilating, for railroad cars	R. Monroe, E. Stone, and E. St. John	51, 607
Window blinds, Locking and stopping	J. Wetzell	48, 003
Window blind fastenings	A. C. Arnold	50, 546
Window blind rod, Wiring	D. Kelley	49, 888
Window cords, Sash to, Attaching	H. J. Adams	49, 489
Window frame and sash	A. B. Shaw	50, 303
Window shade adjuster	E. T. Higham	46, 050
Window sashes, Hoisting and lowering	J. M. Merrymon and K. Ferguson	49, 134
Window sash, Metallic	C. Neer	46, 305
Window sash, Operating	J. R. Baker	48, 889
Window sash, Spring latch for	W. Toshuch	48, 463
Window sash lock	A. C. Arnold	50, 321
Window sash supporters	J. G. Perry	45, 747
Window sash supporters	J. H. Williams	45, 784
Window shutter	G. J. Colby	48, 908
Window stops, Adjustable	W. Shaw	49, 660
Window and doors, Rendering water-tight	W. C. Fuller	47, 368
Window and door fastener	H. Gordon	51, 059
Wine, Age to, Imparting	J. Searle	48, 728

Invention or Discovery.	Name of Patentee.	No.
Wires, Bedstead	E. Craft	46, 967
Wires, Coupling conducting	G. W. Beardslee	47, 918
Wires, Covering	T. S. Sperry	47, 343
Wires, Line, for telegraphs	M. G. Farmer and G. F. Milliken	47, 940
Wires, Rolling	G. Bedson	49, 598
Wires, Skirt	T. S. Sperry	46, 718

Wires, Skirt, Covered, Sizing and finishing	W. E. Frost	48, 766
Wires, Skirt and other, Braiding machine for covering	O. R. Burnham	47, 487
Wires, Telegraph, Composition for insulating	S. C. Bishop	46, 750
Wire cloth, Crimping	W. Zerns	49, 356
Wire cutting machine	L. W. Johanning, jr.	47, 956
Wire fork for toasting, &c.	T. G. Harrold	46, 235
Wire hurdles for loom harness	M. Finkle	49, 251
Wire pointing machine	C. Jillson	47, 954
Wire pointing machine	C. Jillson	47, 955
Wire pointing machine	C. Jillson	48, 283
Wire straightening machine	G. I. Washburn	48, 608
Wire in the coil, Pointing	C. Jillson	46, 242
Wiring window blind rods	D. Kelley	49, 888
Wood, applying colors to	E. Knabeschuck	51, 194
Wood, Bending	S. A. King	50, 601
Wood, Bending	G. Kriebel	50, 602
Wood, Burnishing and polishing	G. Bricker, sr.	49, 192
Wood, Carbonizing	P. Hugon	48, 882
Wood, Coloring and polishing	E. Knabeschuck	51, 462
Wood, Embossing	H. May	50, 608
Wood, Grinding	R. A. Adams	51, 774
Wood, Pine, Obtaining spirits of turpentine, oil, rosin, and other products from	A. H. Emery	46, 092
Wood, Pores of, Composition for filling	D. W. C. Cooley, C. F. Smith, and C. E. Bradley	49, 382
Wood, Pores of, Filling the, Composition for	E. S. Pixley	50, 384
Wood, Preserving	L. S. Robbins	47, 132
Woods, &c., Preserving	G. Palmer	49, 146
Wood, Resinous, Extracting turpentine and other products from	D. Hull	48, 406
Wood, Splitting	W. L. Williams	51, 506
Wood, Straw, &c., Pulping	J. W. Dixon	51, 704
Wood, straw, and other vegetable fibres, Treating	J. W. Dixon	51, 705
Wood-bending machine	J. P. Lelezelter	46, 479
Wood-bending machine	F. Smith	48, 591
Wood-bending machine	S. Keeler	48, 181
Wood-bending machine	M. F. Connett	48, 661
Wood-bending machine	P. Hurn	49, 109
Wood-bending machine	T. D. Roberts	51, 353
Wood-bending machine	J. E. Crane	51, 562
Wood gear, Cutting	C. R. James	49, 881
Wood gear, Cutting	J. Jackson	51, 458
Wood-splitting machine	J. H. Hildebrandt	47, 019
Wood-splitting machine	B. F. Perry	49, 913
Wood from decay, Preserving	A. Hamar	48, 636
Wood and oil barrels, Preserving, Composition for	C. Brandenburg	46, 873
Wooden piles, Surface of, Protecting the	L. J. Henry	46, 049
Wool, Fleeces of, Putting up	S. G. Chase	50, 450
Wool, Lubricant for	B. A. Earle	46, 551
Wool, Lubricating material for	H. Bottomley	48, 509
Wool, Oiling	B. H. Lightfoot	46, 006
Wool, Oiling	J. Kelley	47, 427
Wool, Oiling	B. A. Earl and H. Holcroft	47, 938
Wool, Oiling	J. Shinn	48, 348
Wool, Oiling	M. J. Roberts	48, 351
Wool, Oiling, in carding machines	G. S. Harwood	46, 104
Wool, Oiling, in carding machines	J. W. Hussey	46, 189
Wool, Oiling, in carding machines	J. Shinn	46, 194
Wool, Oiling, in carding machines	J. Eccles	47, 767
Wool, Refuse, Preparing for use	L. T. Stiasny	45, 768
Wool, Washing	J. A. Clark	46, 078
Wool, Washing	J. Petrie, jr., and J. Kenworthy	46, 306
Wool-washing machine	C. G. Sargent	50, 961
Wool or hair from animals, Clipping	C. W. Emery	45, 821
Wool and hair from animals, Clipping	C. W. Emery	46, 226
Wrench	G. Meader	45, 931
Wrench	A. Y. McDonald	47, 067
Wrench	J. White	49, 208
Wrench	L. Jordan and L. E. Smith	50, 364
Wrench	J. P. Lindsey	51, 465
Wrench, Screw	J. W. Penney and E. M. Thurston	51, 617
Wringer, Clothes	H. W. Love	49, 128
Wringers, Rollers for, Covering	D. Lyman	50, 482
Wringers, Washing-machine	R. B. Huganin	47, 827
Wringer and scrubbing-brush mop	J. T. Hagerty	49, 519
Wringer and washing machine	L. Frey and J. Hahn	50, 701
	N. B. Webber	49, 684

Invention or Discovery.	Name of Patentee.	No.
Wringing machine	G. N. Bolles	46, 046
Wringing machine	C. H. Amidon	47, 079
Wringing machine	M. Harris and R. G. Bush	48, 933
Wringing machine	J. O. Couch	49, 025
Wringing machine	J. N. Rose	49, 043
Wringing machine	J. E. Atwood	49, 361
Wringing machine	J. D. Burdick	49, 372
Wringing machine	J. O. Couch	50, 531
Wringing and washing machine	E. Springer	50, 401
Wringing and washing machine	R. A. Gawler	51, 580
Wrist pins, Making	L. Saarback	49, 307
Writing, Training the muscles in	E. G. Squires	46, 827
Y.		
Yarns, Felted	J. H. Bloodgood and M. A. Johnson	49, 367
Yarns, Printing	E. J. Stephens and H. E. Green	46, 829
Yarns, Spinning, Jacks and mules for	J. Goulding	47, 547
Yokes, Ox	J. H. Whitney	46, 742
Yokes, Ox	E. S. Woodford	47, 263
Z.		
Zinc, Manufacture of	J. Webster	46, 198

REISSUES—1865.

A.		
Air, Carburetting	H. L. McAvoy and E. S. Hutchinson	2, 069
Amalgamators	T. Varney	1, 924
Articles of irregular form, Forming and punching	L. Dodge	2, 084
Augers	R. Jennings	2, 081
B.		
Bark, Tan, Extracting	S. W. Pingree	1, 922
Bark, Tan, Leaching and preparing extracts from	W. W. Allen and O. Warren	1, 844
Barrels, Coating, to render them oil-tight	The U. S. Barrel Coating Company	1, 860
Barrels, Preparing, to contain petroleum, coal oil, &c.	L. S. Robbins	1, 847
Barrel machinery	W. Trapp, jr.	1, 946
Barrel machinery	W. Trapp, jr.	1, 947
Bed bottom, Folding	F. C. Payne	1, 941
Bell, Door	H. H. Abbe	2, 134
Blacking, Slate surface, Composition for	L. N. Pierce	2, 095
Boilers, Brewer	A. Hammer	2, 001
Boilers, Steam	E. N. Dickerson	1, 993
Boilers, Steam	H. C. Sergeant	2, 082
Boilers, Steam	R. E. Rogers and G. Black	2, 130
Boiler tubes, Sealing	P. E. Garvin	2, 080
Bolts	W. J. Clark	1, 917
Bolt-heading machine	J. Minter	2, 093
Book, Covers of, Embossed	W. T. Anderson and H. S. Archer	2, 089
Bottoms on sheet metal ware, Casting	L. J. Worden	1, 896
Boxes, Cartridge	R. A. Chesebrough	2, 094
Boxes for hats and bonnets	O. A. Dailey	2, 040
Brakes, Car, Railroad	J. Davis	1, 857
Brakes, Pulley, Self-acting	J. Jochum	2, 020
Brewing	A. Hammer	1, 905
Brick machine	J. Hotchkiss	2, 121
Bridges, Truss	R. Comins	1, 884
Bridges, Truss	A. D. Briggs	2, 070
Broom	C. L. W. Baker	2, 059
Burner, Petroleum, for cooling, &c.	J. P. Hayes	2, 120
Buttons	C. Smart	2, 006
Button-holes, Incising, embossing, and printing articles of wearing apparel	S. S. Stone	2, 024
C.		
Cans, Fruit	W. W. Lyman	1, 920
Cannons, Wrought	H. Ames	1, 882
Cars, Railroad	L. Myers	1, 910
Cars, Railroad, Roof for	A. P. Winslow	2, 051
Cars, Railroad, for transporting oil and other liquids	J. P. Keeler	2, 031
Carpet-bag frames	S. Langowitz	2, 035
Cartridge box	E. Blankeslee	1, 861
Cartridge boxes	R. A. Chesebrough	2, 094
Cartridge boxes, Making	E. Allen	1, 949
Cartridge cases, Making	E. Allen	1, 948

Invention or Discovery.	Name of Patentee.	No.
Cartridge cases, Metallic, Loading	C. H. Lavis	
Cases, rooms, &c., for preserving and transporting articles of food and other substances, Construction of	D. E. Somes	1,909
Chair, Spring-back	R. H. Staples	1,986
Chair bottom or back	J. P. Tice	2,016
Chair seats	H. J. Seymour	1,873
Cigars, Mouthpiece for	J. Ball	2,113
Chucks, Self-centering	G. H. and J. Y. Clark	2,104
Clover, Hulling	E. A. Blackwell	1,868
Cocks	N. Jenkins	1,879
Cocks, Gas	J. G. Lettingwell	1,931
Coffee and tea-pots	E. B. Manning	2,013
Coffee and t-a-pots	E. B. Manning	2,075
Collars, Paper, Enamelled	J. H. Hoffmann	2,034
Collars, Paper, Folding	G. W. Ray and V. N. Taylor	2,056
Collars, Paper, Folding	G. W. Ray and V. N. Taylor	2,110
Collars, Shirt	W. E. Lockwood	1,867
Collars, Shirt	W. E. Lockwood	1,926
Collars, Shirt	W. E. Lockwood	1,927
Collars and cuffs, Ladies'	W. E. Lockwood	1,960
Collars and cuffs, Ladies'	W. E. Lockwood	1,981
Collars and cuffs, Ladies'	W. E. Lockwood	1,982
Collars and cuffs, Ladies'	W. E. Lockwood	1,983
Colors, Dye, Manufacture of	M. Howe and H. R. Stevens	1,958
Colors, Dye, Manufacture of	M. Howe and H. R. Stevens	1,959
Combs, Curry	C. W. Saladee	1,854
Composition of matter, Improved	L. Francis and C. H. Loutrell	1,885
Composition of matter, Improved	L. Francis and C. H. Loutrell	1,886
Composition of matter, Improved	L. Francis and C. H. Loutrell	1,887
Condensers	W. A. Lighthall	1,878
Condensers, Water, Portable	W. A. Lighthall	1,879
Cooking, &c., Petroleum burners for	J. P. Hayes	2,120
Cork, Cutting	P. Holmes	2,030
Corn shellers	T. D. Burrall	2,083
Cotton pickers	G. A. Howe	2,137
Cotton pickers	G. A. Howe	2,138
Cuffs and collars, Ladies'	W. E. Lockwood	1,980
Cuffs and collars, Ladies'	W. E. Lockwood	1,981
Cuffs and collars, Ladies'	W. E. Lockwood	1,982
Cultivators	R. A. Leeper and Z. B. Kidder	1,996
Curing provisions	D. E. Somes	2,096
Curtain fixture	E. T. Briggs	2,026
Cutter, Meat	R. V. Jones	2,055
Cutter, Straw	D. Porter and K. Smith	1,892
Cutter, Straw	H. K. Parsons	1,899
Cutters, Straw	J. Mumma	1,906
Cutters, Straw	D. W. C. Cumings	1,911
Cutters, Straw	W. Gale and B. B. Belcher	1,977
Cutters, Straw	W. and A. Gale	2,119
Cutters, Straw	W. Gale and B. B. Belcher	2,127
D.		
Detectors, Time, Watchman's	J. E. Burk	2,054
Dextrine, Sugar, &c., Manufacture of	T. A. Hoffmann	1,995
Dies for carriage bolts	W. J. Clark	1,916
Dies for stamping rings	O. M. Draper	2,063
Drills, Grain, Seed-covers for	J. S. Gage	2,041
Drills, Wheat	J. B. Crowell	2,011
Dye colors, Manufacture of	M. Howe and H. R. Stevens	1,958
Dye colors, Manufacture of	M. Howe and H. R. Stevens	1,959

INDEX.

XCI

Invention or Discovery.	Name of Patentee.	No.
Fire-arms, Revolving	W. H. Elliot	1, 938
Fire-arms, Self-loading, Magazine in	G. W. Hughes	1, 943
Fireplaces	C. A. Littlefield and D. Boyle	2, 074
Folder, Shirt-bosom	J. Stevens	2, 097
Food, Concentrated, Preparing	J. H. Schenck	1, 945
Food and other substances, Construction of rooms, cases, &c., for preserving and transporting articles of.	D. E. Somes	1, 909
Forks, Hay, Elevating	T. F. Hiser	1, 939
Forming and punching articles of irregular forms	L. Dodge	2, 084
Fountain, Soda	S. R. Sylvester	2, 033
Frames, Carpet-bag	S. Lagowitz	2, 035
Frames, Roving	G. Chatterton	1, 950
Fruit, &c., Preserving, Houses for	B. M. Nyce	2, 036
Fruit and other perishable substances, Preserving	B. M. Nyce	1, 960
Fruit and other perishable substances, Preserving	B. M. Nyce	2, 037
Fruit and other perishable substances, Preserving	B. M. Nyce	2, 038
Funnel and measure, Combined	S. R. Dunmer	2, 012
Furnaces, Boiler, Steam	J. Amory	2, 058
Furnaces for decomposing and desulphurizing ores	R. Spencer	2, 021
Furnaces for treating ores by superheated steam	The Hagan Manufacturing Co. and W. E. Hagan.	1, 988
G.		
Gases and oils, Condensing and separating	W. G. W. Jaeger	1, 902
Gates for water wheels	A. L. Stout, W. M. Mills, and J. Temple.	2, 062
Glasses, Looking, or mirrors	L. P. Angenard	1, 883
Gold and silver, Amalgamating and collecting	H. W. Adams and S. S. Worthington	2, 028
Governors, Engines, Steam	J. Judson	1, 889
Governors, Engine, Steam	T. Silver	2, 039
Governors, Engine, Steam	R. W. Gardner	2, 064
Grain binders, Automatic	R. D. Brown	1, 875
Grain separators	E. and H. and M. E. Montgomery	2, 098
Grates for furnaces	A. Winterburn	2, 078
Gums and palates, Artificial	J. A. Cummings	1, 848
Gums and palates, Artificial	J. A. Cummings	1, 904

Harvesters	C. Wheeler, jr.	1, 975
Harvesters	N. Cogswell and W. H. W. Cushman	2, 007
Harvesters	R. Dutton	2, 047
Harvesters	R. Hoffheims	2, 102
Harvester, Clover and grass seed	W. N. Whiteley, jr.	2, 009
Harvester, Grain and grass	A. Whiteley	2, 017
Harvester, Raking attachment to	R. D. Brown	1, 876
Harvester, Raking attachment to	R. D. Brown	1, 963
Harvesting machines	J. Reilly	2, 099
Hides and skins, Tanning	S. H. Kennedy and H. L. Elder	1, 849
Hides and skins, Tanning	S. H. Kennedy and H. L. Elder	1, 955
Hoisting machines	W. G. Brower	1, 990
Hoisting machines	W. Miller	2, 003
Hoisting machines	W. Miller	2, 065
Hoisting machines	W. Miller	2, 066
Hook Coat and hat	J. T. and H. A. Pratt	1, 997
Hook, Tackle	J. W. Norcross	2, 042
Horsehoes	H. Burden	1, 998
Houses for preserving fruits, &c.	B. M. Nyce	2, 036
Hulling and scouring machines	O. P. Stevens	1, 923
Hydrants	C. L. Stacy	1, 985
I.		
India-rubber rolls to metallic shafts, Fastening	G. J. Colby	1, 992
Iron, Manufacture of	J. D. Williams	2, 073
Iron, Refining	C. Shunk	2, 118
Irons, Smoothing	W. F. Shaw	1, 859
L.		
Ladder, Step	J. H. Balsley	2, 010
Lamps	J. E. Ambrose	1, 900
Lamps, Locomotive	J. Mayhew and T. S. Ray	2, 128

Invention or Discovery.	Name of Patentee.	No.
Lamps, Locomotive	I. A. Williams	2, 133
Lautern	J. H. Irwin and J. F. Griffin	1, 850
Lard and tallow, Rendering	C. E. Gray	2, 048
Latches, Knob	R. L. Webb	2, 131
Lathes, Turning	N. Harper	1, 994
Lathe chucks	W. A. Rielly	2, 053
Leather, Splitting	J. A. Safford	2, 123
Leather-splitting machine	J. A. Safford	1, 956
Leather, Treating	E. A. Ashcroft, J. H. Johnson, and A. S. Moore	1, 845
Legs, Artificial	D. D. Parmelee	1, 907
Legs, Artificial	D. D. Parmelee	1, 908
Light, Artificial, Rendering the same as daylight	N. H. Gillet	1, 918
Lightning arrester for telegraphs	G. A. Stearns	2, 043
Locks, Row	J. W. Norcross	1, 846
Looms	M. A. Forbush and G. Compton	1, 901
Looms	C. Duckworth	2, 018
Looms	C. Duckworth	2, 019
M.		
Mash-tun	A. Hammer	2, 002
Matter, Composition of, Improved	L. Francis and C. H. Loutrell	1, 885
Matter, Composition of, Improved	L. Francis and C. H. Loutrell	1, 886
Matter, Composition of, Improved	L. Francis and C. H. Loutrell	1, 887
Mattress, Spring	S. P. Kittle	2, 092
Measure and funnel, Combined	S. R. Dummer	2, 012
Meat mincer	A. W. Hale	2, 136
Metal, Sheet, Cleaning	E. A. Harvey	2, 116
Metal-ware, Sheet, Casting bottoms on	L. J. Worden	1, 896
Milk, Condensing	G. Borden	2, 103
Mills, Hominy	R. E. Richardson	1, 919
Mills, Saw	J. K. Knowlton	2, 072
Mills, Stamp, and ore crushers, Collecting the dust from	J. Brodie	2, 090
Mirrors or looking glasses	L. P. Angenard	1, 883
Mortising machine	S. S. Bartlett and T. H. Dodge	1, 852
Moulds, Candle	W. Humiston	2, 108
Mouth-piece for cigars	J. Ball	2, 113
Mowing machines	R. Dutton and R. L. Allen	2, 079
Music, Keyed instrument of	F. Peabody	1, 866

REPORT
OF THE
COMMISSIONER OF PATENTS
FOR
THE YEAR 1865.

LETTER

FROM THE

COMMISSIONER OF PATENTS,

TRANSMITTING

HIS ANNUAL REPORT FOR THE YEAR 1865.

UNITED STATES PATENT OFFICE,

January 31, 1866.

SIR: I have the honor to transmit herewith the annual report of this office for the year 1865, to be laid before Congress.

I am, very respectfully, your obedient servant,

T. C. THEAKER,
Commissioner.

Hon. SCHUYLER COLFAX,

Speaker of the House of Representatives.

UNITED STATES PATENT OFFICE,

January 31, 1866.

SIR: In accordance with the provisions of the fourteenth section of the act approved March 3, 1837, I have the honor to submit the following report of the operations of this office during the year 1865.

The receipts and expenditures of this office for the year, and the condition of the patent fund at its close, will be seen by a glance at the following statements:

No. 1.

Number of applications for patents during the year.....	10,664
Number of patents issued, including reissues and designs.....	6,616
Number of caveats filed	1,937
Number of applications for extensions of patents.....	78
Number of patents extended	61
Number of patents expired, December 31, 1865.....	914

Of the patents granted, there were to—

Citizens of the United States	6, 428
Subjects of Great Britain	82
Subjects of French empire	40
Subjects of other foreign governments	66

No. 2.

Statement of money received during the year, namely :

On applications for patents, reissues, &c	\$321, 572 20
For copies and recording	27, 219 64
Total	<u>348, 791 84</u>

No. 3.

Statement of expenditures from the patent fund.

For salaries	\$100, 032 54
For contingent expenses	75, 244 43
For temporary clerks	97, 453 37
For withdrawals	420 00
For refunding money paid by mistake	649 00
For judges in appeal cases	400 00
Total expended	<u>274, 199 34</u>

No. 4.

Statement of the patent fund.

Amount to the credit of the patent fund, January 1, 1865	\$55, 592 28
Amount of receipts during the year	348, 791 84
Total	<u>404, 384 12</u>
From which deduct the amount of expenditures	274, 199 34
Leaving to the credit of the patent fund, January 1, 1866, the sum of	130, 184 78
Surplus of receipts over expenditures	<u>74, 592 50</u>

The unprecedented activity of the mechanical industry of the country since the close of the war of the rebellion is strikingly manifested by a comparison of the business of this office for the last year with that of the previous years since the organization of the office.

Table exhibiting the business of the office for twenty-nine years ending December 31, 1865.

Years.	Applications filed.	Caveats filed.	Patents issued.	Cash received.	Cash expended.
1837	-----	-----	435	\$29,289 08	\$33,506 98
1838	-----	-----	520	42,123 54	37,402 10
1839	-----	-----	425	37,260 00	34,543 51
1840	765	228	473	38,056 51	39,020 67
1841	847	312	495	40,413 01	52,666 87
1842	761	391	517	36,505 68	31,241 48
1843	819	315	531	35,315 81	30,766 96
1844	1,045	380	502	42,509 26	36,244 73
1845	1,246	452	502	51,076 14	39,395 65
1846	1,272	448	619	50,264 16	46,158 71
1847	1,531	553	572	63,111 19	41,878 35

1865	10,664	1,937	6,616	348,791 84	274,199 34

It is here seen that the number of applications for patents received in 1865, exceeded by nearly forty per cent. the number filed in any previous year, and the number of caveats filed exceeded those of any previous year by more than seventy-five per cent. The number of patents issued exceeded those issued in 1864, the highest previous year, by more than thirty per cent.

The receipts into the patent fund exceed those of any former year by more than thirty-six per cent., while the expenditures were only increased a trifle over eight per cent., and a considerable surplus is left to the credit of the patent fund.

If the cases brought to the attention of the office continue to be as numerous as at present, it will become necessary to make such additions to the examining and clerical force of the office as will absorb a portion of the surplus earnings; while, on the other hand, if the anticipated resumption of specie payments should be attended with any general financial prostration, the receipts of the office would undoubtedly fall below the rate of the present expenses.

When the Patent Office was first established as a separate bureau, in 1836, the act provided for the appointment of a single examining clerk. The number has been increased by additional legislation at successive periods, until, by the act of March 2, 1861, the limit was fixed at sixteen examiners and the same number each of first and second assistant examiners.

As will be seen by a reference to the comparative table given above, there was a material reduction in the business of the office immediately after the passage of the act just referred to, and it was found unnecessary, until recently, to appoint the full number of examiners allowed by law. But so rapid has been the increase of inventive activity, that it is now found impossible to prevent the examinations falling largely in arrears.

The number of applications in the hands of the examiners at the close of the year, on which no action had been taken, was 1,134.

I would therefore recommend that authority be given for the appointment of four additional officers of each of the several grades, if their services shall be found necessary to the examination of the applications presented.

By the act of May 27, 1848, the salary of the examiners was fixed at twenty-five hundred dollars per annum; and by the act of March 3, 1855, that of the first assistant and second assistant examiners was fixed at eighteen hundred dollars and sixteen hundred dollars per annum, respectively. The position of first assistant examiner is one of great importance and responsibility, as he is frequently called upon to decide upon the merits of applications in the absence of his principal, and it is also of almost daily occurrence that the pressure of work will be such as to force the examiner to rely mainly upon the judgment of his assistant. I am satisfied that the interests of the office and of inventors generally would be promoted if the salary of the first assistant examiners were raised to two thousand dollars.

I would also most respectfully urge that the salary of the librarian be raised to twenty-five hundred dollars per annum, the sum now paid the examiners. The library now contains upwards of 15,000 volumes, exclusive of some 1,500 volumes temporarily in the rooms of the Agricultural Department. Although the number of volumes is not so large as may be found in many other public libraries, the works are almost exclusively of a scientific and technological character, and it is doubtful if there is another library in the country which is so nearly complete in all the departments of practical knowledge. During the past year rather more than 1,000 new volumes have been placed upon the shelves, while the expenditures, exclusive of the sums paid for the binding and transportation of the specifications and drawings of English patents so liberally presented to the office by the Great Seal Patent Office of England, have been less than \$500.

The library is constantly visited by inventors from all parts of the country, as well as by persons engaged in the various branches of scientific investigation, and it is requisite that the librarian shall be a man of broad culture and familiar with the contents of all the works under his care. As these cover the whole domain of practical science, it is manifest that the salary of the librarian should be at least equal to that of a principal examiner.

In addition to the examining corps, the administrative and financial business of the office requires a considerable force of clerks, who are distributed into several divisions, such as experience has shown to be most conducive to the rapid performance of the work.

I think there can be no doubt of the propriety of having each of these divisions under the charge of a clerk of the highest regular grade; and I would therefore recommend that authority be given for the appointment of six clerks of the fourth class.

The disbursing clerk is now ranked as a clerk of the fourth class. All moneys received or expended by the office pass through his hands, and he is held responsible for the accuracy of his accounts.

I can see no reason why his salary should be less than that generally paid to the disbursing clerks in the several executive departments, and I would recommend that his salary be fixed at two thousand dollars per annum.

The act of March 2, 1861, provided for the appointment of a board of examiners-in-chief, whose duty it should be to revise and determine upon the validity of decisions made by examiners when adverse to the grant of letters patent. An experience of five years has fully confirmed the wisdom of the enactment, but it has at the same time demonstrated the necessity of additional legislation upon the subject. While a fee of twenty dollars is charged upon an appeal from the examiners-in-chief to the Commissioner, no charge is made for an appeal

from the examiners to the board. It results from this that appeals are taken in many cases without a shadow of ground, and, in contested cases, merely for the purpose of delay. During the year 1865 there were 495 appeals taken to the board, of which number 166 remained undisposed of at the close of the year. If a fee of ten dollars were charged on appeals to the board it would check the number of frivolous appeals, and would be gladly paid by those inventors who are confident of the justice of their claim, as they would recognize it as securing them an early decision in place of the delay of months to which they are now so generally subjected.

After consultation with many inventors, and with solicitors in extensive practice, I am satisfied that the proposed amendment would be received with almost universal favor.

The published reports of this office, with the descriptions and illustrations of patented inventions, are not only of great value to inventors and the country, as indicative of the directions in which mechanical and scientific skill is pushing its way into new channels, but their general diffusion effects a very important reduction in the labor to be performed in this office. By a study of the report, one who has perfected an improvement in some useful machine is in many instances enabled to see at once whether his invention is novel, and if so, the particular feature which has never been the subject of a patent. Again, when an existing patent is referred to by the office as a reason for the rejection of an application, the applicant is saved the time and expense required to obtain a copy of such patent by its publication in the annual report. This is especially true of the latest reports, inasmuch as, when a necessity is felt by the public for an improvement in some particular art or manufacture, the ingenuity of inventors in different parts of the country is stimulated into activity in that particular field, while at another period the excess of activity is turned into other paths.

For these reasons the labor of the office is much increased by the delay which has recently attended the publication of the annual reports; and the value of the reports to the public is much diminished by the late day at which they make their appearance. The heavy pressure upon the Public Printing Office, occasioned by the increased business of all the executive departments growing out of the war which has now been so happily terminated, has been one cause of the delay; and if this were all, it would not be expected that this office should complain. But the most serious obstruction to an early issue is found in the state of the law, or rather, I might say, in the absence of any law upon the subject. Although it has long been the settled practice of the government to publish the list of patents with the illustrations, there is no law authorizing such publication except as the printing of each report is ordered after the same is submitted to Congress. Some time must then elapse before a contract can be made with the engravers, and it is usually April or May before the engraving can be commenced upon the patents of the previous year. It is worthy of consideration whether authority might not be given in advance for the preparation of the plates, so that the drawings could be placed in the hands of the engraver as soon as the patents are issued, and the whole work be prepared for the printer immediately after the close of the year. The number of copies to be printed might be determined by order of either house of Congress, after the report is submitted, in the same manner as now. If this course be adopted, the public will be placed in possession of the information nearly, if not quite, a year earlier than they can under the present system, and the charge upon the treasury will be in no measure increased.

Concurrent with the establishment of this office was the adoption of the policy of disposing of the models illustrative of inventions in such manner as should be conducive to a beneficial and favorable display thereof, the rooms in which they were arranged to be kept open during suitable hours for public inspection. The act also contemplated the exhibition of specimens of unpatented manufac-

tures and works of art. The thirty years which have succeeded have seen the germ thus planted expand into magnificent proportions, until the saloons on the upper floor of the Patent Office are now among the chief public attractions of the seat of government, and thronged daily by visitors from all parts of the country as well as from beyond the ocean.

Here may be seen at a single glance, as it were, the progressive steps in the invention and perfection of the wonderful labor-saving machines of the past quarter of a century, from the first blind gropings of mechanical genius up to the splendid and successful productions of the present day. The models are not only of great assistance in the examination of applications, but it is my conviction, which I am happy to know is shared by many of those most conversant with the subject, that from ideas gathered in a visit to these halls have sprung many inventions of great value to the community. It is in view of this last suggestion that the wisdom of the framers of the act stands out in the boldest relief, since the benefits which are to flow in the future from this source are almost incalculable. If this policy is to be continued, which I hardly allow myself to doubt, the attention of Congress must be turned, at an early day, to the consideration of the manner in which enlarged accommodations for this office can be provided. Of three hundred and ten cases for the reception of models, but twelve are now unoccupied, while one is barely sufficient for a single week's issue of patents. By removing the rejected models, which now fill eighty-six cases, and by crowding the whole to their utmost capacity, it will probably be possible to exhibit the patented models of the next three or four years, although with much inconvenience. At the same time, it should be stated the models accompanying rejected applications are often of a high value for purposes of illustration and suggestion.

The rooms in which the business of the Patent Office is now transacted are even more inadequate for the purpose than are the galleries above. Under the administration of my immediate predecessor it became necessary to use for other purposes some of the rooms before occupied by copying clerks, and the work of copying was given out to be done by copyists at their private residences. Although the practice involves the sending the files and records of the office through the streets and into various parts of the city, I have thus far found myself unable to make any change from the utter impossibility of providing desk room within the building for the fifty-six copyists now employed; and the work of this division is constantly increasing. The large increase in the number of patents requires a corresponding increase in the force employed in engrossing and recording, and the orders upon the office for copies of records and for recording assignments have more than doubled in the last four years.

In 1862, the receipts into the patent fund for copies and recording assignments were.....	\$11,081 50
In 1863.....	16,976 29
In 1864.....	20,055 22
In 1865.....	27,219 64

A considerable loss of time inevitably results from the interruptions attendant upon placing two examiners, with their respective assistants, in the same room, as it is not infrequently the case that inventors, or their counsel, desire to appear in person and deliver oral arguments before the examiner. In many interference cases there are three or more contesting applicants, and while a cause of this character is being tried on one side of a small room, it is manifest that no business can be transacted upon the other side which requires any close attention or consecutive thought. Notwithstanding this objection, six of the examiners are obliged to accommodate themselves to such arrangement, as there are but thirteen rooms which can be assigned to this branch of the business of the office.

It is worthy of note that the classes in which the work has fallen most behind

are in this situation. If additional examiners shall be appointed, as I have recommended above, the evil will be but intensified, unless rooms can be assigned to them which are now occupied by other bureaux. The library is also crowded into a space too narrow to allow the proper arrangement of the shelves, and it is impossible to devote any convenient space for the use of those not connected with the office who desire to consult the books. In fine, while the occupation of some rooms in addition to those now at my disposal is a matter of immediate and pressing necessity, it is evident that many years cannot pass by before the whole of the present building will be needed, unless some radical change shall be made in the organization and business of the office.

The most feasible plan for attaining the relief which is now so urgent is undoubtedly that of providing rooms in some other building for the use of the Agricultural Department. Of the value of the services which that department has rendered to the country since its organization I cannot speak in too high terms, and with the immense territory which is just opening, for the first time, for the application of *intelligent farming*, the labors of the department will be proportionately increased as the bounteous stream of knowledge which it diffuses spreads over a wider and wider field. If a change of location could, in any way, impair its usefulness, its removal would be a serious matter; but I am informed that, in the opinion of the head of that department, such would not be the result. Already a portion of the clerks are placed in other rooms, and only by an entire abandonment of the Patent Office can the whole department be brought together. If it came properly within the scope of this report, I might consider the propriety of erecting a suitable building for the use of the Agricultural Department; but leaving that subject to the Commissioner of Agriculture, with whom it appropriately belongs, I must reiterate that the absolute necessities of this office demand additional rooms, which can be obtained immediately in no other way than by the removal of that department.

The law in relation to the issue of patents, as well as the practice of the office, in its general features, has been so nearly uniform for a long term of years that any violent innovation is objectionable; but there are some few matters of detail in which, in my judgment, the interests of both inventors and the public would be promoted by a change.

The twelfth section of the act of March 2, 1861, provides that all applications for patents shall be completed for examination within two years from the filing the petition, and in default thereof shall be regarded as abandoned.

Under the construction given to this statute by my predecessor, it has been the practice of the office to regard applications as abandoned when they have lain two years after a rejection without any action on the part of the inventor to procure a reconsideration. The correctness of this interpretation of the law has recently been questioned, and it must be admitted that a strict adherence to the letter would hardly sustain the rule. There is clearly no reason why an application should be regarded as abandoned in the one case which will not weigh with even stronger force in the other. If the practice spoken of be not adhered to, it becomes impossible to determine when a rejected application can be referred to on the examination of a subsequent one, or when the model and drawing may be submitted to public inspection, as neither is proper while the application is considered as pending. There can be no hardship in requiring one who makes claim to an invention, and who has had one or more examinations by the office, and then allows the case to rest for two years or more without action of any kind, to present a reasonable excuse for his delay if he desires to call the matter up anew. I would therefore recommend such an enactment as will leave no doubt of the legality of the course hitherto pursued.

This period of *two years* is recognized in several instances as the measure by which the rights of an inventor shall be determined; and I am convinced that if the same idea is extended to another case not now within its scope, the occa-

sion for much serious injustice will be removed. Under the existing law a patent is taken out in which the inventor makes a clearly defined claim to a particular feature. The claim, it may be, does not cover all that is described in the specification or shown in the drawing, and whatever is thus left unclaimed may be used by any person, unless protected by a previous patent. Some enterprising manufacturer, who is keen enough to recognize the value of that which the inventor did not deem it worth his while to appropriate, invests his capital and begins to furnish the public with a valuable article; and after this the inventor applies for a reissue of his patent and an extension of his claim so as to give him the monopoly of that which he had before left open to the use of the world. If it appears, upon examination, that the original specification described the art or device in question, and that the holder of the patent was actually the original inventor, he is entitled to a reissue in such terms as to preclude the use of such device, except upon such conditions as he may grant. It would not be difficult in this manner to entrap a person into such an arrangement of his business or employment of his means as to leave him at the mercy of the inventor, or to compel him to pay an exorbitant royalty, when the patent is reissued with a broader claim. In my opinion it would be a judicious amendment of the law, and would prove an effective safeguard to the rights of innocent parties, if the privilege of reissuing a patent in such terms as to broaden the claim were restricted to the first two years of the life of a patent, leaving reissues for other purposes to be granted at any time, as at present.

The act of 1861 allowed applicants to pay a portion of the fee required for the issue of a patent at the time of making application, and the remainder at the convenience of the inventor, whenever he might desire the patent to be engrossed. As it was found that many patents were allowed to lie indefinitely, it was further provided, in 1863, that if the final fee were not paid within six months after the patent was passed and allowed, the invention should become public property as against the applicant. In 1865, it was further enacted that any person who fails to pay the final fee within the time limited may make a new application for the same invention at any time within two years from the date of the allowance of the original application. Under this state of the law, cases have been brought to the attention of the Office, in which inventors have been unable to pay the fee within six months, or to file a new application within two years from the date of the allowance of their application, by reason of absence from home in the service of the United States. To confiscate the property of an inventor because he has imperilled his life for the sake of his country is so glaringly unjust that it needs but to be mentioned to secure the adoption of a remedy. I would suggest that, whenever it be made to appear to the satisfaction of this Office that a failure to pay this final fee, or to renew an application within the time limited by law, has been due to the absence of the inventor from home on duty in the army or navy of the United States, the forfeiture shall be set aside and the patent issued.

The sixth section of the act of March 3, 1839, provided that, in all cases where an invention had been patented in a foreign country prior to the issue of a patent here, such patent should be limited to the term of fourteen years from the date or publication of such foreign letters patent.

On the second of March, 1861, it was enacted that all patents thereafter granted should remain in force for the term of seventeen years from the date of issue. This was construed by my predecessor as merely extending the term, but as in no wise affecting the limitation above quoted from the act of 1839. The Office, therefore, continued to antedate all such patents in the same manner as before the passage of the act of 1861; and, as my attention was not called to the point on my assuming the direction of the Office, the same practice has been followed until quite a recent period. My attention having been called, within a short time, to the subject, it has been held, after consultation with the Secretary of

the Interior, that the rule of the Office, for the past five years, was clearly without any authority of law, the act of 1861 plainly operating the repeal of so much of the act of 1839 as shortens the term of the patent. Although the language of the statute is so explicit as to necessitate this construction, I have reason to believe that such was not the intention of the framers of the act, but that they merely intended to extend the term from fourteen to seventeen years, as an equivalent for the withdrawal of the privilege of extension. The belief that such was the intention of the act was so general among inventors and patent lawyers that the former ruling of the Office was almost universally accepted for nearly five years. Under this state of facts it is manifestly proper that those patents which were issued for a shortened term under the former practice of the Office should be continued in force for the full term of seventeen years from the date of their issue, if the law in relation to the subject is to stand as at present. As, however, some legislation is necessary, I would invite attention to the following considerations:

While an application for a patent is pending, the specification, model, and drawing are held strictly confidential, no knowledge of them being allowed to go beyond the office without the express consent of the inventor or his duly authorized attorney. Any other course would be full of peril to the honest inventor, as unscrupulous men could readily adopt whatever was valuable in the invention, and there would be no redress. Secrecy is the only protection available before the issue of the patent. But, in cases of an invention which has been patented abroad, the full description is already open to the public, so that nothing is gained by treating the application as confidential, while there are reasons of great force for applying exactly the contrary rule to these cases. If any manufacturer or artisan meets with the published description of an invention which, upon inquiry, he learns has not been patented in this country, it is surely legitimate for him to adopt it; and this fact is recognized by the existing statute in denying a patent for an invention patented abroad if the same has been introduced into use in this country. But this provision has been hitherto almost a nullity in practice, since it is rarely possible for the Office to obtain trustworthy information as to the question of fact. No one but the applicant, or others in his interest, is cognizant of the pendency of the application, nor would the knowledge be likely to reach the persons most interested if the veil of secrecy were withdrawn. When an application is made for the extension of the term of a patent, the law requires that notice of the fact shall be given to the public by advertisement in a newspaper in the city of Washington, and in another published in that part of the country most interested adversely to the grant of the petition. I can see no reason why the same rule should not be followed in the case of inventions already patented abroad, and I would, therefore, recommend an enactment to that effect. As the cost of advertising is about twenty-five dollars for each case, it would be necessary to increase the fee payable on such applications by that amount; but the inventor would be fully compensated for this by the full term for which his patent would run. The much greater probability of the fact of the invention having been introduced into use being made known to the office would deter inventors from the risk of the delay which now so frequently intervenes between the issue of the foreign patent and the applications here. In fact, I am strongly inclined to the opinion that such a change in the law would result in the much earlier introduction of foreign inventions to the American public than has heretofore prevailed.

When applications are made for the extension of patents, as the law now stands, the Commissioner alone decides the case, and from his decision there is no appeal. In my opinion this lodges with him too much power. In the class of cases referred to there is often a very heavy interest at stake, frequently amounting to hundreds of thousands of dollars, and the adverse parties are the patentee, or his heirs, on the one side, and the public on the other. The act of

1836 vested this power in a board consisting of the Secretary of State, the Commissioner of Patents, and the Solicitor of the Treasury; but with the increase of business, and the consequent frequency of applications of this character, it became difficult, if not impracticable, to assemble the board, so that, in 1848, a change was made, and the law was fixed as now. Since the establishment of the Board of Examiners-in-Chief the evil which led to the passage of the act of 1848 no longer exists, and it appears to me eminently proper that extension cases should be referred to this board for decision. And the public interest would be rendered more certainly secure if the concurrence of the Commissioner with the action of the board be required before a patent can be extended. The plan suggested possesses the advantage that the matters involved would be considered by four minds instead of one, and there would be much less danger of an extension being procured by corrupt means than where one alone decides the case, and that, too, without appeal. I suppose it to be prudent to so legislate as to guard as far as possible against fraud and corruption by making it dangerous to attempt and difficult to accomplish, rather than to seem to invite it by making it either easy or safe; and as courts for deciding important causes are seldom so constituted as to consist of but one member, why should the custom be departed from in this instance where heavy interests are depending?

With over eleven hundred applications untouched by the examiners at the commencement of the present month, and new cases coming in more rapidly than the old ones can be disposed of, I have felt unwilling to require those employed on the several classes of invention to devote the time necessary for the preparation of any elaborate review of the progress in the arts, which is evidenced by the records of the Office for the past year.

The following brief sketches will be found, however, to be well worthy the attention of all who are interested in the development of the industry and resources of our country and of mankind.

CLASS A.—AGRICULTURE.

Division 1.—Implements for working the soil, &c. Division 3.—Implements for preparing produce for market.

There is perhaps no agricultural implement of greater importance than the plough, and in some form this has been used by men through a greater number of centuries than any other implement. Its history is an interesting one, and its efficiency may be taken as an index to the state of civilization in all countries where it is used. Consisting at first of the rude branch of a tree, it has from time to time been improved until it is difficult to conceive in what way it can be made more efficient. In no country has there been greater improvement in this implement of husbandry than in the United States of America, and it is a significant fact that these improvements have been made chiefly by men in the northern States.

The efficiency and proper use of the plough lie at the very foundation of all our national prosperity. The demand for its use is first in peace, and indispensable in war. Its use furnishes bread to the million, and commerce to the world. At no time has its efficiency been more marked than during the past few years. Notwithstanding nearly a million of men were taken from industrial pursuits in the loyal States during the first two years of the war, the third year found a larger breadth of grain upon the ground than the year preceding the rebellion. This ability to supply the deficiency of manual labor is due chiefly to improved instruments for cultivating the soil. From the earliest history of our country two things have stimulated improvements in machinery of various kinds: First, necessity; and second, the protection offered to inventors by our patent law. Since the establishment of the Patent Office there have issued not less than five

hundred and sixty-five patents for improvements in ploughs alone, and the number of patents on cultivators (which implement in fact is but a modification of the plough) will not fall much short of this number. The single plough has been the longest in use, and has undergone the greatest number of modifications. Various materials have been used in its construction. Fifty years ago it was mostly made of wood and iron, the share being tipped with steel; cast-iron has since been most extensively used. In some parts of the country, especially the prairies of the west, the soil is found to possess a particular property of "packing" upon the mouldboard, which adds greatly to the force required to turn the furrow. Cast-steel has been used, with partial success, to obviate this difficulty, but it has been found that its liability to rust presents the same objection found in the use of cast-iron. Within the last year efforts have been made to use glass and other vitreous substances in the construction of mouldboards, and it is said that reasonable success has thus far attended the effort. In those experiments that have been made with glass mouldboards, it is found that the friction upon the soil is very much reduced, requiring from one-quarter to one-third less power to perform a given amount of work than a cast-iron mouldboard.

Considerable attention has also been paid within the last year to the construction of what are termed "gang ploughs." In very heavy ploughing they are not likely to go into use, but in second or fallow-ground ploughing they may become very efficient and labor-saving.

Much has also been done to improve cultivators. These, it will be seen, have been brought to a good degree of perfection, so much so that in the cultivation of corn (maize) and other similar crops but little use for the hand hoe remains. From ten to twelve acres forms an ordinary day's work for a man and horse.

In seeding machines the attention of inventors has been directed to a greater proficiency and exactness in their operation; and it is gratifying to know that these efforts have been crowned with success.

Since the return of Union soldiers from the cotton States there has been considerable attention paid by many of them to the improvements of machinery for planting the staple of that section of the country, and from the present indications the heavy and unwieldy "slave hoe" will soon pass into oblivion, as has the system which gave it use. The planting and cultivation of the cotton crop differs in some degree from that of maize, and hence requires a modification of the implements for that purpose.

Several important and, it is believed, valuable patents have issued within the past year, intended to aid directly in the cultivation of the cotton crop, which, no doubt, if introduced will save at least nine-tenths of the labor previously required, thus supplying by the use of machinery the loss of labor that has been feared in consequence of the abolition of slavery. In truth, the labor thus set free will become employed in other channels of industry, while a larger breadth of land will be cultivated in a better manner and with greater profit. During the past year a number of valuable patents have been granted for machines for threshing and preparing grain for market; and it would seem probable that invention in this direction has nearly reached the culminating point.

With the most recent improvements in grain separators, it is found to be practicable to separate the grain and deliver the straw in good condition for binding—quite a desideratum, when straight straw in bundles bears nearly the price of hay. The degree of perfection which has been attained in the cleaning and separation of various kinds of grain from each other is truly astonishing, and it would now seem almost impossible to make up a mixture of the various kinds of grain and tares that could not by one operation become completely separated, delivering each kind and parcel by itself.

The degree of perfection to which all inventions are now tending has not and

will not be gained by a single mighty stride in any particular branch, but is and will be the result of what may be termed small improvements, one inventor adding a little here, and another a little there, and thus little by little the invention grows as it were to the stature of manhood, and becomes useful in the great theatre of life. While the improvements hereinbefore enumerated are, perhaps, among the most important to the farmer, it is proper to state in this connection that the minor implements have not been neglected by inventors. A great variety of improvements is being introduced in various farming implements and tools, tending as a whole to the reduction and ease of manual labor, as well as a more perfect result and a richer reward.

CLASS A.—AGRICULTURE.

Division 2.—Machines and implements for harvesting grains, grasses, &c.

Invention in reaping and mowing machines during the year has been confined principally to improvements in details of construction and arrangement, these details embracing almost every part or feature of the several machines in common use. Among those as having received especial attention may be mentioned the manner of connecting the hinged folding cutting apparatus with the main frame, the object being to make the connection strong, simple, and reliable, such as to allow the cutting apparatus to conform freely to inequalities in the surface of the ground, and also in some cases to rock or roll in the direction of the path of the machine; for varying the angle of presentation of the cutters to the ground, so as to adapt them to the nature of the work to be accomplished. Considerable attention has been given to the manner of combining and the means for operating in what is termed the "combined reel and rake," operating in connection with the hinged cutting apparatus, whereby the motions of the latter in conforming to the uneven surface of the ground were imparted to the rake and reel, keeping them always in the same relation to the cutting apparatus and platform, and enabling them to work equally well in any position. Various improvements have also been made in the manner of operating the "dropping platform and cut-off," devices designed to displace the various rake attachments, which require, ordinarily, much power to operate them, the cut-off serving to arrest the fall of the cut grain upon the platform, while the latter is tilted or has its rear edge dropped upon the ground, so as to slide the grain accumulated thereon off upon the ground in the path of the machine, in convenient shape and quantity for binding. One result of these numerous improvements has been to render the machines imple in construction, and in machines to be operated by a single horse, and even of hand machines for lawn mowing, and, consequently, several patents have been granted during the year upon machines of this latter class.

Horse rakes have received their share of attention, though invention in this branch of the division, also, has been confined to improvements of devices already in use. The tooth of the rake has been improved in form, &c., so as to adapt it to use upon the most uneven ground; also, the means for attaching the teeth to the head, and the device for operating the rake, both automatically and by the attendant, so as to secure at the same time simplicity and efficiency. The same in substance may be said of the various other machines used in securing the crop of hay and grain, such as hay spreaders, horse hay-forks, rakers, loaders, &c. Improvements therein have been confined to perfecting details, so as to make these machines simple and cheap, efficient in the performance of much of the severe labor of the harvest heretofore done by hand, and within the reach of the farmer of moderate means.

CLASS A.—AGRICULTURE.

Division 4.—Mills for grinding.

In the class of mills for grinding and dressing grain, including the bolting and packing of flour, no very marked or distinctly radical invention has been made during the year, the applications relating to the details and improvements of old ideas and devices rather than to the leading principles embraced in this division of inventions.

In the other branch of this class, embracing the breaking and grinding of quartz, inventors show energy and inventive talent which leads off in four distinct directions—one in improving, perhaps the most ancient of methods for reducing the quartz by stamping; another by revolving heavy grinding wheels in a trough, the wheels passing over the quartz; while another reduces the quartz, first by crushing between reciprocating jaws and afterwards passing the broken pieces between rollers and grinding surfaces to complete the reduction; while still another places the broken quartz into a strong receptacle, having revolving arms with breakers or hammers upon them, which in their rapid revolution strike the quartz and break it by the force of the blow, or by projecting it against some other part of the machine arranged for the purpose. The operation is kept up until the quartz is reduced to powder.

CLASS B.—CALORIFICS AND PHOTICS.

Division 1.—Apparatus for warming, ventilation, cooking, &c.

The increase of inventions in this division is clearly indicated by the following figures: In 1863 the number of cases presented for examination was 305; in 1864 it was 389; and in 1865 it was 562; and the number of cases passed for issue was 292. This increase in the number of applications does not appear to have been disproportionately great in any particular class of cases, but if in any, those pertaining to the adaptation and use of hydro-carbons for fuel.

There have been twenty-nine cases of the former and twenty-two of the latter. A good number of ingenious devices promising much in economy, and attractive on account of size and portability, have been patented; but no remarkably novel feature was presented in any. Old ideas developed in former cases, in our own or in foreign patents, have been generally adhered to, and but little change is found in the invention than some specialty in the construction or arrangement of the different parts of the apparatus. But none have shown any high degree of inventive skill, though marketable, useful, and very attractive devices have been produced.

It seems well nigh certain that there is a broad field of invention to be opened by finding how hydro-carbons may be best used as fuel. They possess in themselves, so admirably condensed, the chief elements of combustion, that we must confidently expect at no distant day to find them in practical, economical, and common use in steamships, locomotives, workshops, for cooking, and other purposes requiring the application of heat. Already we see tokens that inquiring minds are beginning the busy search for means to bring about such a result.

Several furnaces for steam boilers, the inventions of our own citizens or foreigners, have been patented. The improvements here have been generally of an important character.

The construction of grate bars has received much attention; many new and apparently useful devices, where strength, durability, and lightness are well combined, have met with favorable consideration.

Inventors and manufacturers also have been very industrious in producing new combinations in cooking and heating stoves and in furnaces, but so much had been done in this domain in former years that little more remained to be

accomplished, than to produce some slight improvements in the adjustment of the several parts.

The large number of applications for patents for grain dryers seems to be a correct index of the demand for economy in time and labor which commerce now makes, in order to prepare the cereal crops of the west for their markets, and serves to show how great the endeavor is to substitute for the labor of men's hands the cheaper and more powerful agents of mechanical combinations.

The ventilation of mines, ships, houses, cars, churches, &c., has been earnestly discussed in many applications; well known and most competent men, possessing large information about the history and science of this subject, and capable of adding experience to education, have produced several meritorious inventions. The new styles in building houses, ships, &c., and the new devices for generating heat for warming apartments and other kindred causes are constantly calling for modifications of old schemes of ventilation, or for new expedients to preserve a reasonable supply of vital air in the rooms where we dwell or pursue our daily avocations. Efforts in this direction appear to be all the more worthy of notice, and more commendable, as the devices or apparatus are not generally of such a character as to win large present praise or pecuniary compensation for the toil and thought bestowed upon them.

CLASS B.—CALORIFICS AND PHOTICS.

Division 2.—Lamps, lanterns, gas-burners, &c.

The last four years have wrought a great revolution in the whole economy of artificial light. In all families beyond the reach of gas-light, candles have almost disappeared, and lamps, producing a light nearly as desirable as gas, have taken their place. This has resulted mainly from the immense development within that time of petroleum, which has in a few years sprung up into a national interest, as the following facts will show:

There were exported in 1862, 10,887,701 gallons; in 1863, 28,250,721 gallons; in 1864, 31,755,687 gallons.

Of crude oil there were refined, in 1864, 22,553,288 gallons; in 1865, 30,472,127 gallons.

Estimating the quantity consumed at home as only equal to that exported, the whole amount produced is, in 1862, 21,775,402 gallons; in 1863, 56,501,442 gallons; in 1864, 63,511,364 gallons; in 1865, 86,673,462 gallons.

This great new source of artificial light having been obtained, it remained for the inventive genius of the country to construct lamps fitted for its consumption. The result has been that nine hundred and eighty-six applications have within that period been filed in this class, being more than four times the number in the same class during any previous period of the same length.

The objects aimed at have been mainly to produce a clear flame without smoke or unpleasant odor, by cutting off the heat from the oil reservoir, spreading the flame and concentrating upon it the oxygen of the atmosphere; to cheapen the manufacture of lamps so as to bring them within the reach of all; to accommodate them for lanterns for general use, and for locomotive head-lights, and for signal lights for conductors of railway trains. These objects have been so generally attained that they have gone into almost universal use.

CLASS C.—CARRIAGES AND LAND CONVEYANCES.

The applications in this class have been largely in excess of any former year, and the improvements have been numerous and varied, but most of them have been modifications or changes in well-known devices, and are, therefore, not of a character to demand special description or comment.

CLASS D, E AND Q.—CHEMISTRY AND METALLURGY.

The whole number of cases filed in 1865 was 1,326, and 966 of these were passed for issue. The number filed in 1864 was 818.

The number of distinct arts and manufactures embraced in these classes is so large as to make it out of the question to notice any but the more prominent ones.

The high price of gas-producing coal, and the abundant supply of the light hydrocarbons from petroleum has induced a great many inventors to seek for means of using naphtha, benzine, &c., as a substitute for gas for illumination.

The mode of accomplishing this is to charge atmospheric air with the vapor of the hydrocarbons. In a general way the problem has been long solved; but in practice it is found that to accommodate the varying temperature of the air, the varying density of the naphtha, and the different rates at which the vapor is required for consumption, has presented difficulties which are, as yet, only partly overcome. But several of the devices presented this year show very marked improvement over former inventions.

The treatment of petroleum and its products, so as to purify and render them applicable to new uses, has received a good deal of attention. The heavy parts of petroleum are now largely used for lubricating machinery, and for that purpose seem almost indispensable. Patents have been issued for modes of treating petroleum so as to render it suitable for mixing paints, preserving wood, oiling wool, and making blacking and varnish. Paraffine, the solid nearest related to coal oil, is found useful in coating barrels for coal oil, cloth, leather, and many other articles where water-proof covering is wanted.

Besides patents for new articles of hard rubber, there have been nine patents issued during this year for improvements in the production of this material. Heretofore it has been difficult to give any desired color to hard rubber, except a jet black. By several of the inventions lately patented, any color may be given to this material. It is expected that these inventions will greatly increase the manufactures from hard rubber.

The manufacture of iron and steel has received special attention during this year. Numerous improvements on what is known as the Bessemer process have been patented, and the working of that process in this country is fully established. The strengthening of both cast and wrought iron, by the addition of purifying materials, such as chrome, manganese, cryolite, and various alloys and compositions, has been effected.

Several of these processes, while possessing no great amount of scientific novelty, are quite important in their practical results, in some instances raising the tensile strength of cast iron from thirty to fifty per cent. at a small cost.

A patent has been issued for an improvement on what is known as malleable cast iron, which renders that material of greatly increased value for the manufacture of cutlery, ploughs, and other articles.

Several patents have been issued for making iron and steel direct from the ore. Judging by the specimens shown, the improvements seem to possess considerable utility.

Rich ores, suitable for this course of treatment, abound in this country, and there have been numerous efforts made to establish a successful manufacture of bar iron direct from the ore. But generally, after a brief trial, these efforts have been abandoned.

Improvements on the well-known processes of puddling, smelting, and refining iron have been numerous. These generally relate to labor-saving machinery and processes.

The number of improvements in machinery and processes for obtaining the precious metals have been large. These relate especially to modes of freeing

the ores from sulphur, and to machinery for effecting the amalgamation of the metals in a better manner. It is well known that only a small part of the gold contained in the ore can be recovered by any of the ordinary processes. A patent has been granted for combining a small amount of the metals, sodium or potassium, with the mercury used in amalgamation. This has the effect to greatly increase the affinity between the mercury and gold.

CLASS F.

Divisions 1 and 2.—Civil and Railroad Engineering.

The following tabular statement shows the condition of the class of inventions under the above divisions in comparison with the number of applications and issues for the year 1864 :

Months.	Applications received.	Applications issued.	Months.	Applications received.	Applications issued.
1864.			1865.		
January.....	33	24	January.....	57	38
February.	35	20	February.....	59	26
March.....	39	22	March.....	88	33
April.....	35	29	April.....	75	35
May.....	33	25	May.....	51	47
June.....	47	24	June.....	63	76
July.....	59	24	July.....	56	41
August.....	39	25	August.....	85	45
September.....	66	41	September.....	58	41
October.....	42	17	October.....	68	59
November.....	45	39	November.....	79	47
December.....	63	71	December.....	60	20
Total.....	536	371		799	503
Increase in 1865..	263	132		-----	-----
	799	503		799	503

This class has kept pace with many others in the office in the development of inventions, although nothing of a peculiarly marked character has become the subject of official action. The improvements patented as well as the applications generally refer to railroads, mining implements, and apparatus used for boring wells. The number of applications covering inventions appertaining to railroads, numbers for the year 1865, 330; and those appertaining to boring or operating wells, for the discovery of oil, 256. The development of this rich product of the earth has stimulated invention to an extraordinary degree. The locality of the oil being so deep in the bowels of the earth, requires the use of devices that can penetrate with the greatest rapidity its hidden reservoirs. Numberless difficulties have been met, which the ingenuity of the inventors has already overcome, and many are now the subject of deep thought and anxiety. It is reasonable to suppose, from the progress already made in the development of means to gather this great element of wealth, that in a short time the progress of invention will determine the best and surest method for the attainment of the greatest results.

CLASS F.

Division 3.—Mechanical Engineering.

In this division much of interest has been accomplished, for here exists an extended field for the inventive mind, which seems to a great degree to have kept pace with the increasing wants of the people, and anticipated the demand for labor.

The ingenuity of inventors has attempted, by mechanical means, to so control and operate the various machines with which our country abounds, that they have to a very great extent supplied the places of the persons who were made victims of war. In brief, it may be said that during the past year more has been done in this direction than in any previous year of the existence of this office. Hay and cotton presses are embraced in this division, and during the continuance of the war the transportation of hay and straw for army purposes became so vastly increased, that it gave rise to a necessity for some improvements in machines for baling purposes, and the adage "Necessity is the mother of invention" has been abundantly proved in the numerous advancements which have been made to meet the exigency.

To such perfection has the method arrived, that bales of hay or straw can be made so compact as to occupy but little more than one-fourth the space that was required for bales of the same weight in former years. Since the war has ended and the shipment of hay, &c., has diminished, the applications for such devices have fallen off. But the South has been opened to free labor, and now cotton presses are increasing in about the same proportion; showing again that the inventive genius of our people is inexhaustible and adequate to meet any emergency. We may now expect many important improvements in this direction, inasmuch as "king cotton" is hereafter to submit to such compression as free men shall consider proper.

CLASS G.—FIBROUS AND TEXTILE MANUFACTURES.

This class embraces all the machinery and processes for separating fibre from plants, for operating upon the fibre, and for the production of fabrics, except those in which the aid of chemistry is required.

The whole number of applications in this class for the year 1865 was 378, as against 338 for 1864, and 276 for 1863; showing an increase of about 10 per cent. over 1864, and of about 31 per cent. over 1863.

Of this number (378) 250 patents were ordered to issue; of which there were for sewing machines 83, (including hemmers, guides, &c. ;) looms and fabrics, 56; spinning machines 33; knitting machines, 20; paper and paper twine machines, 14; carding machines, 13; wool-oiling machines, 9; wool-washing machines, 3; the remainder being distributed among machines for dressing threads, &c., braiding, weaving a covering for cords, measuring cloth, lace and net machines, hat-felting, fulling and finishing felted goods, burring and carding cylinders, thread and yarn winding machines, surface-sizing of wadding, imitation embroidery, &c.

Sewing Machines.

Prominent among these are those designed for stitching button-holes; among which may be mentioned one which adapts the well-known Wheeler & Wilson machine for this purpose, by giving to the bed-plate a slight shifting motion to allow of sewing over the edge of the fabric, whilst a fixed button through which the needle passes, and a straight fixed guide near the needle, afford a space between them for the passage of a flat cloth-holder having parallel sides and semicircular ends, the cloth being affixed to pins on the upper surface of this holder, and having a motion with its forward half, turning and returning. The feed may be stopped at will when it is desired to strengthen or bar across the square end of the button-hole.

Another carries a short thread, as in hand sewing, first through the cloth and returning through the button-hole. The needle is blunt at one end; its point is uppermost, and it has two eyes in the middle. The range of motion of the needle-arm is gradually lessened as the thread is consumed; the cloth is fed by means of an irregular gear, somewhat of a button-hole shape.

Another machine employs, in addition to the ordinary Wheeler & Wilson bobbin for the lower thread, a similar bobbin to carry a cord or bar thread; each bobbin lies within the cavity of its own revolving hook, whose axes are both in the same line; one hook oscillates, the other revolves; the threads are wound upon the bobbins in opposite directions. One hook catches the needle loop and carries it over its bobbin and over the cord; the oscillating hook then seizes this loop, carries it in the opposite direction and drops it over its bobbin. The four-motion feed is used, but it has, in addition, a lateral and return motion.

In another machine a single thread is used for button-holing; an inclined looper beneath the table, with a crescent-shaped end, advances, rises, and carries a loop above the table and over the edge of the cloth and over a tongue on the cloth plate; it then makes a quarter turn, that the needle may descend in the notch of the looper and within the loop; on its retreat it becomes free from the loop, while the feed advances and pulls the loop off the tongue; this allows sufficient looseness of the stitch to allow it to be laid out flat in turning back the goods, edge to edge, as in the sewing of carpets.

In another, in which three threads are used, a reciprocating hook manipulates the loops in such a manner that the loop of the needle thread shall surround that of the thread carrier, and that the shuttle thread shall pass through this loop of the carrier.

Another machine, in which are used the usual perforating needle and, also, a lower thread carrier, which takes its thread up and over the edge of the cloth, is so modified as to be easily converted into a lock-stitch machine. To effect this the thread carrier is turned upon a pivot out of operative action, while a swinging shuttle carrier is placed in action, and the loop-spreader above the cloth is locked to the needle bar, so as not to rotate as when used in button-holing.

Mr. Humphrey has also some improvements upon his machine patented in 1862, designed, among other things, to give the required increase of feed while sewing around the eyelet or rounded part of the button hole.

Among the improvements designed for sewing with waxed thread upon leather, &c., are the following:

Means for heating the wax and for waxing the thread, and also for heating the metallic parts of this machine near which the waxed thread must pass; improvements in positive take-up levers for the thread; in the form of the shuttle and of the needle; in means for closing the uppers of shoes and gaiters, and for other work on leather, where it is desirable that the line of the seam shall be sunk below the surface of the material, thus dispensing with excessive tension on the threads and avoiding the weakening of the leather, as if the usual groove were cut; in means for avoiding the liability of the goods to become stretched and puckered, and thus preventing the hole punctured by the awl from getting out of its true position for the needle to enter; in dispensing with the usual large cams, thus diminishing friction and noise, and in the use of automatically lifting presser-feet; in means for waxing the needle thread, not, however, until after the thread has passed through the fabric, the shuttle thread receiving its wax from the needle thread, the liquid wax being steadily and automatically forced up from a reservoir into a shallow concave in the shuttle race, a closed door to the shuttle preventing any wax from entering, and a felt or cloth wiper, saturated with benzine, clearing the shuttle of any adhering wax.

Another machine, for sewing the soles upon boots and shoes while the same are turned inside out, has its platform, which sustains all the sewing mechanism, centred upon the driving shaft, and so that it may be raised or lowered, by a rack, to bring the operative mechanism into proper position relatively to the channel in the shoe where the line of stitching is to be made; the table supporting the work is also adjustable vertically. Another of this class automatically registers the number of shoes soled by it.

Several novelties appear in machines for making and stitching ruffles, one of which, whilst feeding the cloth in the ordinary manner, passes it, also, through an auxiliary device secured to the table; a wheel in this device is rotated by the passage of the cloth, and it gives a greater velocity than its own to another wheel, which thus gathers the lower piece of cloth; adjustable hinged spring plates press the cloth upon these wheels, and when the operator does not wish to ruffle, this pressure is relieved by means of thumb-screws.

A box-plaiting apparatus is also connected with a sewing machine, so that in the finished goods, plaited upon the sewing-machine table, there shall be in each single plait two stitches, and in each double fold or box plait four stitches.

From among the other peculiar features observable in sewing machines may be further enumerated the following:

Locating the shuttle-race *above the table*, and supporting it on the needle-arm bracket; giving to the shuttle a *grooved tongue* for its whole length, which supports it in a dovetailed groove in which it travels; employing a *blast of air* to open and properly deflect the loop of the needle-thread, for the shuttle to enter; giving to a feeding wheel a forward and backward movement, in addition to the usual rotary movement; the wheel is locked during its forward movement, thus acting as an ordinary feeding dog, but in its backward movement, instead of falling like a feeding dog, it rotates on its axis, and the surface of the wheel rolls on the under surface of the cloth without moving it; changing the line of direction of a four-motion feed to any line within the range of ninety degrees, by the mere turning of a circular plate in the table through which the feed-dog works; compensating for the wear on its bearings of the revolving looping hook by means of a split bushing, compressible by an adjusting screw; driving the machine faster or slower, or stopping it altogether, while the driving power continues the same; making on a Wheeler & Wilson machine either a simple chain stitch or a chain stitch interlaced with a locking thread; adapting a Wheeler & Wilson machine to the making of the Grover & Baker stitch, as well as the lock stitch; also to the making of a three-threaded stitch, being the lock stitch and Grover & Baker stitch combined; providing means whereby the varying thickness of goods passing under the presser foot shall cause the needle to rise to corresponding elevations, while it shall not fail to descend uniformly to the same point, that its loop may be properly taken by the shuttle or looper; so arranging the crank motions for operating the needle and shuttle, as that the reciprocations of the mechanism shall counterbalance each other, all the primary actuating devices for all the motions (except the needle-arm) being brought into a compact group, and attached to a single piece of casting.

Looms.

In this class the *card-shaft* of a *Jacquard* has been given an endwise motion in addition to its usual intermittent rotary motion, to admit of weaving different patterns by the same cards.

In *lappet-weaving*, the pattern-wheels in a late improvement have been placed on the side of the looms, instead of on the lay, to admit of working a larger pattern; the needles working vertically as well as laterally.

In another machine the pins in the pattern-wheel are adjustable, to vary the pattern.

In looms for *weaving pile fabrics*, by means of movable rods, both above and below the warp, narrow goods are woven, having a pile both on the upper and lower surface of the material.

In *weaving fabrics with button-holes*, a portion of the dents of the reed have been made with an inclined projection of the length of the button-hole; the reed has a positive upward motion while weaving one side of the button-hole, and a corresponding downward motion when weaving the other side, to allow the in-

cline to gradually adapt itself to the gradually increasing web as woven, the take-up motion of the cloth being stopped during the downward motion.

In *weaving with hair or grass*, or other short materials, another improvement avoids the exposure of the ends of the weft at the edges of the fabric, and weaves it with a selvage edge, and of any desired width; to effect this the hair or grass is previously formed into a continuous piece by a machine, in which it is fed in upon an endless apron in such manner that each filament or hair shall lie parallel with the others, the smaller ends overlapping the larger ends, and these surrounding a central guiding thread or core, to which they are then united by a binding thread wound spirally around the whole.

In the mode of *driving the shuttles* by condensed air, another inventor uses flexible tubes, connected with a reservoir, and places pistons and cylinders at each end of the shuttle-race.

Rising and falling *shuttle-boxes* are operated in another invention through the variable motions imparted by a set of sliding hooks, each pivoted at a different distance from the centre of the same rocking bar.

To adapt *reeds* to beams of different lengths, another inventor makes their ribs elastic, that they may be lengthened and the dents spread out or brought closer together, as may be desired.

Heddle-frames are also made practicably adjustable to any desired length, by being so constructed as to allow more or less heddles to be put on or off with great facility.

An automatic *registering attachment* records the number of yards of fabric woven, and protects against the felonious abstracting of cloth from the loom.

Means are also introduced to change the weaving at will, and without delay, from plain to twill, and *vice versa*.

Hand-loom.

A marked and increasing activity is visible in improvements in hand-loom, and of these the applications come almost exclusively from the western States.

Their aim is mainly to cheapen, simplify, and render more efficient this class of looms.

In one, the upright rods carrying the harness are interchangeable on the treadles, so as to vary the twill or style of the cloth at pleasure. Others operate the shuttles, harness, and the cloth-beam from the motion of the batten. Tappet-shafts and pattern cylinders are frequently introduced. The difficulties arising from using at times reeds of different thickness are sought to be overcome. An adjustable compound bevelled pinion allows the take-up to be timed as desired, to any point in the vibration of the batten. A pivoted bar on a central picker staff, and to which the picking cords are attached, prevents their being worn away, by keeping them in a right line with the face of the batten. A horizontal adjustability of the bearings of the warp-beam admits of regulating the tension, so as to have both sides of the web uniform.

Spinning.

Latterly more applications for improvements in spinning *mules* and *jacks* have been received than heretofore.

The object, in mules, has been to cause the tension of the yarn, when building up the cop to operate certain novel devices for equalizing the strain, by operating the counter-faller, and thus gripping an endless belt connected with the carriage, until then, inoperative, and, through the medium of other devices, communicating the corresponding change of velocity to the drum and spindles; to drive the whole of the spindles, on either side of the mule-head, from one common horizontal cylinder instead of from several vertical drums; to dispense with the clutch on the horizontal shaft which runs the whole length of

the carriage; and to regulate the tension for winding-on, dispensing with the use of a weighted lever.

The improvements in *jacks* have been for putting friction upon the driving pulley, by partially sliding the belt upon it from the loose pulley, and so assisting the spinner in winding-on; to insure a simultaneous starting of the delivering, stretching, and twisting operations; to permit the delivering operation to cease at any point during the outward movement of the carriage, and while the stretching and twisting is continued; and to secure a correct registry of the number of yards spun, by devices not liable to be tampered with by dishonest operatives as to register falsely.

An improvement in *spinning rolls*, which have an endwise motion, consists in such a construction as admits of removing their bearing ends when worn, and substituting new ones.

A machine for *making paper cop tubes* takes a strip of paper as broad as the length of the cop tube desired, runs it through the machine, applies paste to its surface, cuts it into proper lengths, and presents it intermittently to a rotating mandrel, around which it is formed into its tubular shape by means of a revolving brush; the completed tube is then discharged by the longitudinal withdrawal of the mandrel, and the operation is repeated.

Knitting machines.

In this important department of the arts inventors are very active. Some very ingenious but complex machines were patented within the year; among them an improvement by Mr. Kilbourn, upon his patent of April 9, 1861. It is a straight frame and knits sheets of fabric, so shaped, and with selvaged edges, as to be ready to be sewed up into the form of stockings. The knitting commences at the top and ends with the toe, some of the needles being automatically withdrawn for narrowing. The knitting of the central portion is suspended, whilst forming two side pieces for the heels; after which the central knitting is resumed to form the upper part of the foot and toe. The sole piece is next formed by taking from the needles the two heel strips, and placing them together and again knitting toward the toe. The edges not united in the machine are sewed together by hand, viz: the seam up the back, and the sides of the foot piece.

Tubular goods (such as stockings complete, without seam, and mittens, except the thumb) are also knitted upon a machine having two rows of horizontal latch needles, lying point to point in the same place; a single thread is delivered to each row alternately. The extreme *closed* tip of the stocking is first knitted by the machine, and the continuation of the knitting widens it out and makes it tubular. A Jacquard determines the pattern.

Another inventor employs an *endless chain* of *removable needles*, linked together by hooks and eyes, the chain being capable of being shortened or lengthened, and combined with a provision for reversing the motion of this chain, and thus making *tubular goods* of different sizes, and also knitting straight pieces of widths, and widening or narrowing the same, the whole being a compact machine, designed for household purposes.

Another employs *needles latched at both ends* and sliding across an open space through which the fabric drops, and makes plain or ribbed goods, the latter having the ribs running either transverse or lengthwise of the fabric; the breadth of the ribs being variable at will. He uses either a straight or circular frame.

In another *endless chain* machine, each needle slides in its own independent frame, and the *frames* are linked together by hooks and eyes, so that the chain may be lengthened or shortened. No stitch hooks are used; but the loop is clamped between two flat surfaces to allow a new loop to be drawn through it.

Other new features may be briefly summed up as follows: long latched needle

combined with short latched ones, to allow the interlacing of the loops of one row with those of two or more rows, instead of with the adjacent row only. The knitting of shoe lacings from a number of strands of yarn, coming directly from the spun cops, and without being twisted together, these strands being supplied to a barbed needle, and knitted as one into a single chain by the usual knitting or crochet stitch. Sundry improvements are also made in needles, whereby slides are used instead of latches to close and open the hooks.

Carding, &c.

The improvements under this head are not particularly marked, and relate to means for feeding the fibre and preparing it for being fed; the construction of the cylinders to avoid their liability to spring under the influence of centrifugal force; arranging the feeding-in cylinder so as to facilitate its being easily removed, to be cleaned, ground or repaired; retaining the short waste fibre escaping from the main cylinder; a more uniform stripping of the doffer and reduction of wear; giving the doffer comb an adjustable drawing action on the fibre; means for cleaning cylinders, by a card-clothed brush cylinder having wire teeth about double the length of those of the cylinder to be cleaned; and to hanging the flats of an endless chain of self-stripping top-cards upon their axes in such manner that they can accommodate themselves to the necessary angle to the surface of the main cylinder, required while traversing over the cylinder.

In a cotton combing machine two nipping cylinders rotate intermittently, and by their opening and closing jaws transfer the fibre from one to the other, so as to comb both ends. The feed-rollers and comb vibrate to and from the first nipping cylinder, and deliver to it a tuft from the lap or fleece; this tuft is then acted upon by a combing cylinder having graduated rows of teeth; it next passes to the second nipping cylinder and to a similar combing-drum, and then to a doffer.

Wool-oiling.

In connection with the carding machine, and to be attached to it, several improvements have been made for oiling the wool, embracing among them the following features: Raising the oil from its reservoir by the capillary attraction of a wick whose upper end hangs over a rod or pipe, (which may be heated if desired,) the ridges of a revolving fluted roller press gently this wick and wipe out the oil and convey it to the surface of a plain roller, which by gentle pressure imparts it to the wool upon the feed apron, dripping the oil upon the wool from the pendent edge of a piece of cloth which receives its supply from a drum revolving in a reservoir—a can with an air-tight top and a discharge-pipe at its bottom to supply a tank; while another pipe for air, from the top of the can above the oil line, also extends down into the tank as far as it is intended the oil shall rise; the closing of the oil pipe by the ascending oil in the tank prevents further discharge; in the tank a roller revolves in contact with another above it which serves to spread the wool; a strip of wire gauze attached to a shaft, and which is intermittently immersed in an oil bath and then suddenly sprung back so as to shower the oil upon the wool on an endless apron; a longitudinally grooved roller revolving step by step within an oil tank, so that the oil within each groove shall be permitted to drop through a corresponding opening in the bottom of the tank, an endless wire gauze apron beneath receiving and conveying the oil to the wool on the feed cloth; an independent scraper to keep the pressing roller clear of the oiled wool adhering to its surface, the same being interposed between the pressing roller and the top feed roller of the carder; an oil tank with an enclosed revolving dipper to take up and convey the oil to a revolving brush, which latter conveys it to the feed rollers; revolving blades within a reservoir dashing the oil up to a trough which conveys it to a perforated

revolving disk having a roof above and a slotted pan beneath it, dripping the oil from a reservoir into the mouth of a vertical tube having a ball and socket connection with the side of a cylindrical case which nearly surrounds a revolving brush; this brush, striking a deflector at the mouth of the case, sprinkles the oil upon the wool; by turning the case on its axis, the spray will be scattered over a greater or lesser surface of the wool.

Paper-making.

The inventions in this class are designed to retain the water between the grinding surfaces, and thus keep the pulp from clogging; to improve the durability and efficiency of the bed-knives in grinding engines; to provide for the adjustability of such knives to the desired elevation as they are worn away; to prevent the water from running back upon the pulp; to substitute for the felt or canvas a woven fabric of several plies, loosely interwoven and formed into an endless belt of uniform thickness by lapping the ends, as in Baker's patent, October 22, 1861; and to finish sheets of paper between two flexible sheets of highly polished copper, each of which passes over a roller, the rollers being tightly compressed together and the ends of the copper sheets being sustained by cords and weights so as to move forward and backward.

Sundry improvements have also been made in the manufacture of paper twine.

Winding spools of commerce.

A most ingenious foreign invention, patented here, automatically takes up the common marketable spools upon which sewing cotton is to be wound; places them in position for winding; winds them full; stops when the required quantity is wound; cuts an incision in the head of each spool; fixes securely the thread therein; severs the thread; discharges the spool; takes up fresh empty ones, and starts to wind again.

Lace or netting machines.

In this machine one-half of the threads are disposed in the manner of warp threads, the other half being carried each by its separate shuttle; these shuttles by means of a vibrating frame are taken from a stationary frame beneath the horizontal threads, and are simultaneously carried above them; a lateral motion is then given to all other threads, so that each shall cross two of the shuttle threads, after which the shuttles descend. Vibrating levers are alternately brought into action, to beat up the threads evenly at the points of crossing. No weft is used.

Imitation embroidery.

As a strong and cheap but equally beautiful substitute for hand-embroidered canvas, such as is used for slipper patterns, &c., a fabric is so woven or stamped that its surface shall present, throughout, minute square elevations; this surface is then printed with any pattern or colors desired, and closely resembles the embroidered goods.

CLASS K.—FINE ARTS AND GAMES, (INCLUDING PATENTS FOR DESIGNS.)

It is a curious fact that the war should have disturbed the inventive genius of our people in so small a degree in the ornamental arts. But the happy termination of the rebellion has allowed men to return to their former pursuits with increased vigor, as shown by the applications for patents in this class:

In the year 1860 we received 742 applications; in the year 1861 we received 458 applications; in the year 1862 we received 421 applications; in the year 1863 we received 472 applications; in the year 1864 we received 529 applications; in the year 1865 we received 787 applications.

The nature of the inventions is shown by a few of the following sub-classes. Seventy-seven applications received this year are for improvements connected with the art of printing, forty for improvements in musical instruments, seventy-eight are for improvements in photography. The rest are for book-binding, jewelry, engraving, pens and pencils, safety paper, postage and revenue stamps, bank notes, &c.

After examination five hundred and three patents were granted, and three hundred and ninety-four applications were rejected as unpatentable.

Two hundred and seventeen of the patents granted are for designs, the rest for mechanical devices. Many of these inventions possess an interest surpassing the limit of a few remarks in a report like this; it is sufficient to say that at no former period have there been so many applications for patents in the useful and ornamental arts; and I believe the value of the inventions to the public has not heretofore been surpassed.

CLASS I.—FIRE-ARMS AND IMPLEMENTS OF WAR, SPORTING, AND FISHING.

The successful termination of the war, early in the year, has produced a notable reduction of the number of applications for inventions and improvements in warlike implements; the number is, however, still nearly double that of the year preceding the war, and will most probably remain permanently higher, although destined, no doubt, to fall considerably below its present amount. In view of the time usually required to fully introduce even valuable improvements, inventors will naturally appreciate the advantage of the maxim that bids us prepare for war in time of peace—well knowing that whatever approves itself on careful trial, will ultimately be adopted by the nation, on the principle of an enlightened self-interest.

The whole number of applications filed during the year in matters pertaining to ordnance, small-arms, their ammunition, and the miscellaneous incidents of the military art, is shown in the following table, in comparison with a similar statement for the preceding year, and also for the year before the war.

	1860.	1864.	1865.
Cannon.....	12	52	17
Projectiles.....	17	74	45
Small-arms.....	78	155	126
Cartridges.....	17	38	38
Miscellaneous.....	15	39	27
	<u>139</u>	<u>358</u>	<u>253</u>

A comparison of the number of applications in this class filed during the first six months of the year, with the number filed during the last six months, shows the following proportions:

	1865: first 6 mos.	Last 6 mos.	Whole year.
Cannon.....	10	7	17
Projectiles.....	33	12	45
Small-arms.....	73	53	126
Cartridges.....	20	18	38
Miscellaneous.....	16	11	27
	<u>152</u>	<u>101</u>	<u>253</u>

Under the designation "cannon," are included various methods of mounting and directing guns, as also improvements in gun-carriages. With "projectiles" are embraced various packing bands and sabots for adapting them to rifled

ordnance, and also improvements in shells and their fuzes. Among "small-arms" are included, besides improvements in revolving cylinders and breech-loading devices, various improvements in magazines, locks, &c. Of "cartridges," a large portion relates to methods of priming them, or rendering them inflammable on percussion. And in "miscellaneous" are included various incidents of sights, bayonet attachments, ram-rod worms and scrapers for cleaning gun-barrels, caps, cap machines, cartridge-boxes, torpedoes, tents, &c.

In the following table are shown the number of improvements in fire-arms, &c., actually patented during the last two years :

	1864.	1865.
Breech-loading cannon.....	13	3
Other improvements in cannons and carriages.....	23	13
Projectiles.....	55	31
Breech-loading small-arms.....	59	58
Revolving fire-arms.....	17	21
Other small-arms.....	8	5
Cartridges.....	18	12
Miscellaneous.....	47	36
	<u>240</u>	<u>179</u>

It is interesting to observe that while the class generally has considerably fallen off, improvements in breech-loaders have continued as abundant as ever, and improvements in revolvers, which are most largely used in personal defence, or as the armament of the citizen, have actually increased. While nothing among the above-mentioned patents can properly be selected as worthy of special notice for its pre-eminent merit, it may be safely affirmed that no historic war has been so prolific in the rivalry of invention, and in the reality and variety of improvements in the implements of warfare, as that which has just been waged by our government for the maintenance of its territorial authority and national sovereignty.

CLASS J.—HOUSEHOLD FURNITURE.

In this division the number of applications received during the year was 724, and 427 patents were issued; besides which, there were many cases passed for issue, which were at the close of the year awaiting the payment of the additional fee.

The class embraces almost everything used in furnishing a dwelling-house, except the heating and cooking departments; and it is one of the peculiarities of the inventions that they are such that every family can use them to great advantage.

Judging from the number of washing machines and wringers patented, our people should have the reputation of being the most cleanly people upon the earth. In the manufacture of some of these, especially wringers, large factories have been established, and a great amount of money invested.

During the last six months there has been quite a competition between inventors of brooms, of flour sifters, and of bread and meat cutters.

The most numerous inventions and patents are washing machines and wringers, 92; bread and meat cutters, 35; brooms and brushes, 34; bedsteads, beds and bed bottoms, 31; flour sifters, 23; clothes dryers, 20; tables, 15; chairs, 13; mops, 10.

CLASS K.—HYDRAULIC AND PNEUMATICS.

This class comprehends the mechanical devices adapted for the reception, transmission, and application of the forces, of liquids and fluids.

Among the improvements patented during the last year are the following :

An overshot water-wheel having a partition in each bucket nearly concentric with the periphery of the wheel, and extending more than half-way to the next bucket, in order to retain a portion of the water until the bucket has reached its lowest position, a hole in the base of each bucket permitting the flow of the water outside of the described division, and within said division of the bucket next in advance.

In horizontal scroll wheels, divisions transverse to the buckets are formed to retard the outflow of the water. The retention of water in the casing beneath the wheel is provided for, to relieve the pressure of the wheel upon its steps. Buckets inclining toward the periphery receive their water from a scroll having its bottom formed of a spiral plane longitudinally, and inclined transversely. In wheels receiving water at the periphery, annular gates are elevated and depressed by a horizontal shaft and pinions which move vertical ratchets. In a horizontal wheel, receiving water through several chutes or ports, on the upper side, a partial revolution of a disk or gate closes all these chutes simultaneously.

In water elevators for wells, and in lubricating cups for journals, many minute modifications have been made.

The pressure of water flowing through a cock is regulated by a counter-current of determinable volume presenting its resistance to a flexible diaphragm by means of which a valve in the cock is held to duty. In a globe valve cock the stuffing box is below the screw arrangement, which is detachable to permit grinding the valve.

A flange on the periphery of the vertical valve moves in a corresponding groove surrounding the valve seat. A beer faucet, in screwing into the barrel, displaces a plug, which returns to its position by a spring when the faucet is withdrawn, so that waste is wholly prevented. A vertical valve stem is hung in a surrounding yielding diaphragm, which prevents the rising of the liquid. A flexible ball, constituting a valve, is held by a vertical swivelled follower. An elastic body, fashioned like a long acorn, is held by its cup or flange under the screw-cap, and is opened by a cam movement on top, which contracts the body in the direction of its length by means of a lifting rod secured in the centre of the valve. A soft metal valve is attached to its follower by a joint which admits of adaptation of position to the valve seat. The nozzles of beer faucets are arranged for exciting the drawn liquid by a forcible jet of liquid or air, after the receptacle has been filled. A flexible lining in a faucet is held closed by a spring arrangement, the depression of which permits the flow.

Several vertical pumps are arranged to work the piston in a lateral cylinder, communicating at top and bottom with the main tube. In double-action submerged pumps, ball and other valves are arranged in pistons, communicating with hollow piston rods. Several pistons in a pump are operated by as many rods, some being hollow and concentric with each other, and others independent. In others the valves are held in position, and a section of the tubing moves thereon.

Pumps for deep wells, generally making provision for the presence and escape of gas, are numerous. Detaching and withdrawing the operative parts, at whatever depth, by peculiar arrangements and movements of the rods, has attracted the attention of several inventors.

The appliances for inducing the flow of oil by the pressure of hot or cold air or steam, are numerous and varied. Heat is also applied in different ways to render the oil fluent. Supplemental tubes are also applied for the escape of gas from the pump tube.

A rotary pump has its pistons guided by central cams; another receiving its water centrally beneath, expels it, by concave extension wings, through a scroll.

A horizontal rotary air-pump is enclosed in a casing kept more than half full of water, the buckets being so curved that when their outer extremities strike

the water they enclose each a volume of air, the compression of which upon the surface of the water forces it through a tube, whence it flows out through a hollow end of the shaft. In an air-pump of vertical movement water is used as the medium of forcing air from an adjoining chamber, the receding of the water causing the induction air-valve to open again.

Deep well tubes are packed by means of the inflation or lateral expansion of flexible packing in lieu of the seed bags in former use, through which packings, in some instances, auxiliary tubes are conducted.

Pistons are packed by the flow of water through their sides, and the consequent expansion of their peripheries.

CLASS L.—LEATHER AND HARNESS.

Numerous improvements have been made during the year in the diversified and complicated machinery used in the manufacture of boots and shoes.

Some of these machines seem to cover almost the entire process; all tend to perfection by a series of experiments and improvements. In nearly every stage of the manufacture separate pieces of machinery have been made to do their work. By the proper appliances and the use of machinery the leather is reduced to any desired thickness and pliability, and the lasts are so shaped that the boot or shoe can be made upon them to fit as close and smooth as a glove upon the hand.

Such, in fact, has been the advancement in the improvement of machinery for cutting the leather into shape, lasting it, putting the parts in position, and pegging, nailing, and sewing them together, and then trimming, burnishing, and finishing the work, that in many establishments shoes are turned off, during the working hours, at the rate of one pair a minute, complete. Important improvements, and answering an excellent purpose, have been made by attaching India-rubber soles, and rubber and leather combined, to leather uppers, by sewing and cement, while sabots, wooden soles, attached by screws and rivets, have been much improved.

The improvements in hand tools for the use of shoemakers and saddlers are very marked for their increased simplicity, compactness, and aid in the saving of labor. In the manufacture of harness, saddles, stirrups, bridles, trunks, carpet and mail bags, many new and ingenious arrangements, uniting simplicity with comfort and increased safety, have been made. Snap-hooks, buckles, skates, ice-creepers, &c., have also employed the attention of inventors, and many novel combinations patented, combining simplicity and cheapness with better adaptation.

CLASS M.—LUMBER.

In this class there were 331 applications received during the year, of which twelve were for reissue, and three for extension.

Of this number, 179 have been patented, or ordered to issue, leaving 152 either rejected or waiting the further consideration of the applicant. The 179 patents in this class issued during the year are distributed as follows:

Saw-mills, 6; head-blocks for saw-mills 2; sawing machines, 24; circular sawing machines, 3; saws, 4; shingle machines, 8; cork-cutting machines, 5; planing machines, 5; mortising machines, 3; turning lathes, 6; wheelwrights' machines, 8; barrel machines, 2; veneer cutters, 1; wood splitting, 6; blind wiring, 3; tools, 45; and miscellaneous, 13.

No great leading idea has been developed in this class of inventions during the past year; the applications are confined to devices that make the machines they improve either better or cheaper. Forty years ago nearly all the work in a saw-mill was done by a reciprocating upright saw, working at slow speed; but now the saw must reciprocate at a higher rate of speed, (if such saw is used.) The main part of the sawing is now done by large circular saws, which reduce the cost of the mill in its details, and experience has shown that mills

should be constructed so as to be movable; since, unless the timber can be floated to the mill in water, it is easier to carry the mill to the timber than the timber any considerable distance to the mill.

In wood-bending there has been much done, for in constructing large vessels timber is used differing in shape from its natural growth, which is changed in shape to suit the wants of the constructor by the powerful machines now used for such purpose.

In barrel machinery there has been a great change; since the immense production of petroleum, oil has to be mainly transported in casks of wood; the inventions are mostly for cheapening the manufacture, as well as strengthening the cask, and by sawing the stave to the shape it is to have when in the barrel, which makes a stronger cask, because none of the strength of the hoop is expended in clamping the stave to its shape.

In boring machines some improvement has been made, in one direction, by boring a square hole with a tool, all whose devices revolve therein; and in another direction, by having a series of annular cutters attached to a tool for boring at the same time a number of tubes or pipes.

CLASS N.—MATHEMATICAL AND PHILOSOPHICAL INSTRUMENTS—ELECTRICITY, &c.

A great diversity of subjects is usually presented in this class of inventions, but electricity claims much the largest share of attention. It is remarkable, also, that the proportion of electrical inventions increases every year. During the year 1865, of 234 applications in this class, 82 were upon electrical and magnetic subjects; 34 upon clocks and watches, and 118 of a miscellaneous character.

Hitherto the applications of electricity and magnetism for remedial purposes have been referred to Class O of Surgery, but it has been thought best to make a distinct subdivision of such inventions, under the head of Electro-therapeutics, and transfer them to Class N, for the reason that, in almost all such cases, the decision upon the claim involves inquiry into electricity and magnetism rather than surgery or medicine. These are not included in the above estimate. It may be a surprise to some to learn that the subtle agent of electricity is playing such an extensive part in the theatre of practical mechanics, and that up to the year 1857 more than five thousand patents had been granted, in England alone, for various applications of electricity to the arts, and since that time probably half as many more.

Prior to 1857 upwards of three hundred patents had been granted in England on the subject of electrical cables and conductors for telegraphs, and since that time probably more than that number. It cannot be expected that a single year will bring about many striking developments in electrical science or its application to the useful arts; but the past year has not been unfruitful in this respect. Improvements in electric printing telegraphs have been patented, giving evidence of the highest order of mechanical genius; and also some improvements in the galvanic battery of great practical value.

Since the introduction in electric telegraphy of communicating or rather reading the telegraph by sounds instead of visible signs or imprinted characters, it has become an object to devise means by which the audibility of the sounds would be increased.

To this end the receiving magnet is supported upon a sounding box, through which a tension rod passes, and is so arranged that the sonorousness of the box is varied at pleasure by means of an adjusting screw. These magnets are technically termed sounder magnets, and as they are for the most part the re-

ceiving magnets—that is to say, the fine wire magnets—the printing or registering local magnet is now generally out of use. In fact, in most of the lines of telegraph of the present time the only feature of the Morse telegraph preserved is the alphabet, and this is now an alphabet of sounds instead of characters. After several years of practice the telegraph operators who read by sound become so expert that the continual click of half a dozen different sounders in the same room does not interfere with the reading of their own, and they will even carry on a conversation with a bystander while receiving and committing to writing the telegraphic message.

However desirable such a mode of operating, it is nevertheless liable to frequent errors, and should, and will finally, give place to printing telegraphs for important business and monetary transactions. One of the contingent disadvantages of the phonetic telegraphy is the liability of disclosure to other parties who may be near enough to hear the sounds. For the purpose of obviating this evil, several patents have been taken out for confining the sounds within certain limits accessible only to the operator himself.

A phonetic telegraph has also been patented in which a continuous sound is interrupted or modified to indicate the signs or alphabet.

One of the most interesting developments pertaining to magnetic telegraphy is a mode of making the fine-wire receiving magnets of naked wire, instead of wire covered with silk, as hitherto practiced. No insulating material in the wire is used, except between the different layers. Strange as it may appear, a more perfect insulation is attained than by wire covered with silk or cotton and varnished. The wires are laid in the coil by accurately working machinery in such manner as not to be absolutely in contact, although to the naked eye they appear to touch. The spaces appear very plainly under a small magnifying power, and this space offers the very best medium of insulation. By this ingenious contrivance the wires are brought closer to each other than when covered with silk, and the difference is so great that in a common sounder or receiving magnet, twelve more turns can be wound on one length of the coil than before. Although this is a very decided gain in favor of the efficiency of the coil, it is not all, for a great saving is effected by dispensing with the silk covering, which is very expensive.

Another improvement in phonetic telegraphs has been patented, exhibiting a great deal of ingenuity and scientific study, in which the deflections of a magnetic needle are made to produce the sounds which are magnified by a peculiar acoustic arrangement so as to become audible to the operator.

In connection with this telegraph an ingenious and very novel self-regulating apparatus is introduced by which the current is maintained at a uniform strength, and at the same time susceptible of adjustment so as to vary the strength at leisure.

ELECTRO-THERAPEUTICS.

While it is refreshing to witness the unabated ardor with which the genuine applications of electricity and magnetism are prosecuted to practical results, it is a matter of regret to find so much empiricism pervading the community in reference to the remedial virtues of the subtile agent. With many it seems to be the panacea for all “ills that flesh is heir to.” Electricity as a remedy now takes a very high rank, and has done incalculable service to suffering humanity under judicious administration; and electro-therapeutics has been elevated to a science almost as exact as any other branch of medicine, especially by the French physicians; but, like every other branch of the healing art, is liable to abuse and productive often of mischief in unskilful hands. Among the curiosities of this class calculated to appeal to popular belief in electrical marvels are such inventions as electrical and magnetic combs, brushes, bracelets, spectacles, pen-holders, trusses, beer glasses, soles for shoes, gymnastic clubs, &c.

CLASS P.—ELECTRO-CHEMISTRY, &c.

Electricity is still the resort to account for the explosion of steam boilers, but in every instance the rationale is not in full accordance with existing laws. A patent has been granted for preventing scale or incrustation of steam boilers by an arrangement of conductors said to have an electrical function. The invention was claimed by contesting parties, and on both sides numerous affidavits from creditable sources were brought to prove the genuineness of the discovery, which is one of inestimable value if fully realized.

Electricity and magnetism have also been enlisted in petroleum mining, and a patent granted for introducing heat into the shafts, for softening the paraffine adhering to the walls of openings by means of coils of platinum wire enclosed within a copper case and heated by the galvanic current, thus permitting the unobstructed flow of petroleum.

A patent has also been granted for electro-magnetic "grab-irons," to be let down into the shafts and seize and bring up pieces of broken drills and bits of iron or steel.

INSULATORS FOR TELEGRAPHS.

Several patents have been granted for insulators for telegraph wires, all aiming at one point, viz: the extension of the insulating surface between the point of suspension of the wire and the insertion of the hook upon which the wire is suspended, and also to cover this surface, as far as possible, so as to prevent the deposition of moisture upon it. It is somewhat remarkable that notwithstanding the many devices patented in this and former years, for this purpose, nearly all the telegraphic lines of the present time are supported upon the old bell insulator of glass, the very first kind used in this country.

CLOCKS AND WATCHES.

Number of applications, 34. The prevailing features of improvement have been contrivances for winding up the watch and setting the hands without the use of a key, and quite an interesting variety of inventions has been patented for this purpose.

Also patents have been granted for devices by which all risk of breaking the works by winding up too tight is avoided, and also by which the train is saved from injury in case of a rupture of the mainspring. Watches and timekeepers have been improved more within two or three years past than in any equal period of their history, and the introduction of chronometer movements into watches for the pocket has been perfectly successful. In this connection a patent has been granted for a very ingenious and accurate movement in which the introduction of an additional pallet, in conjunction with a movement patented last year, operates to dispense with the holding spring common in chronometer movements.

CLASS O.

Of this class 31 applications have been for improvements in artificial limbs, 21 for improvements in dentistry, and 112 of a miscellaneous character.

The havoc of war has begotten a multitude of inventions to supply the place of amputated arms and legs, and from among the mass some may be selected as examples of skill and successful operation.

One inventor heralded his application by the introduction of a lad wearing his artificial leg, who had learned to run and to skate; another, a soldier, sent a letter to the office written by an artificial hand and arm of his own invention.

The chirography was rough but legible. Other remarkable performances might be cited to show that artificial limbs have been brought to a high state of improvement, and that the United States are in advance of other countries at present in regard to this invention. Some of the legs and arms presented are of beautiful finish and model, and one of the substantial improvements is in the material by which very strong limbs are made with very little weight. The legs have attained nearer to perfection than the arms or hands. In one instance the several motions of flexing and extending the arm and fingers has been very successfully accomplished by the several motions that could be made by a stump of the humerus or upper arm.

In dentistry one of the most notable improvements patented is the introduction of aluminum for the base-plate of artificial teeth. The greater lightness of this metal, its freedom from oxidation, and its comparatively low price give promise of a great reform in this branch of art. Perhaps no invention of the present day illustrates more beautifully the application of chemical science to the mechanical arts than the introduction of vulcanite or hard rubber as the base-plate for artificial teeth. While this material can be furnished at a trifling cost, it seems to be the very perfection of base-plates, offering facilities for moulding and attachment greater than metals, and being light, durable, firm, sufficiently elastic, and susceptible of coloring in imitation of the natural gums.

CONSERVATIVE SURGERY.

Under this head an interesting and important invention has been patented, by which the usefulness of the arm may be preserved to the patient after the operation of exsection or removal of a part of one or more of the bones of the arm.

CLASS P.—METALLURGIC MANUFACTURES.

Invention is the basis underlying all skilled labor, and must necessarily have been achieved, before skilled labor became possible. Invention is the product of work performed by the brain; a house, a machine, or a railroad is the product of physical labor, or of work done by the hand. Once invented, the construction of any one of these becomes easy, for nothing is then wanting but the manual labor and the directing skill of the workman.

It is true that, without human wants to call it forth, skilled labor to make it available, and proper conditions under which to apply and develop it, invention, though possible, would at this time be restricted to very narrow limits; but it is also true, that invention, thus stimulated, and by these means developed to the wonderful extent which we now behold, has with equal force reacted upon these very means or conditions, and caused new wants to be made known and new aims to be aspired to, by the very confidence with which it has come to be depended upon to supply all needful ways and means.

This latter remark is forcibly illustrated by the inventions of the class now under consideration, in their relations to very many of the industrial arts, and particularly to those which, by their great magnitude and the superior skill and intelligence required in their development, are justly regarded as being at once the greatest civilizing agents, and as leading the way in material and social progress.

As at present constituted, the class of metallurgic manufactures includes branches to a certain extent distinct from one another, of which the principal or most important are—

1st. Founding, or the process of casting, and, included therewith, the form and construction of moulds, flasks, &c.

2d. Machines of general application, such as those for forging, rolling, planing, boring, punching, shearing, &c.

3d. Machines for the manufacture of articles of sheet metal, for cutting, bending, stamping, spinning, riveting, &c.

4th. Machines adapted exclusively to certain special uses, as to the manufacture of nails, bolts, nuts, screws, needles, pins, files, chains, horseshoes, &c.

5th. Tools and implements of every description required in the construction of machines and in the fabrication of metallic articles.

To confirm what has been said as to the importance of this class of inventions, one has only to answer to himself this question—what would be, at the present time, the condition of labor, of the industrial arts, of individual and national wealth, or even of civilization, had invention in this department remained stationary at the point to which it had attained fifty, or even twenty-five years ago?

Of the inventions patented during the past year, none can be considered remarkable for superiority over similar inventions of previous years, although there is very evidently a general and progressive improvement; but what is remarkable is the greatly increased number of applications for patents received during the past year.

In illustration of this, the following statement is submitted, showing the total number of applications in this class received yearly during the last four years, viz:

For the year ending December 1, 1862.....	349
For the year ending December 1, 1863.....	381
For the year ending December 1, 1864.....	615
For the year ending December 1, 1865.....	1,005

CLASS R.—NAVIGATION.

The inventions in this class patented during the past year do not present any especially remarkable features, nor has the number of applications exceeded those of former years so much as in the other divisions. One hundred and forty-three applications were filed, and one hundred and eleven patents issued.

CLASS S.—STEAM ENGINES.

The number of cases received in this class during the year was 517; the number rejected was 150; and the number passed for issue, 392.

The subjects which seem to have engrossed the minds of inventors in this class principally for the last year are steam generators, balanced slide valves, piston-packing, automatic boiler feeders, air and gas engines, and oil ejectors for oil wells. In steam generators some marked improvements have been made, among which may be noticed some for the instantaneous generation of steam by injecting a given quantity of water into a highly heated receptacle, which water is injected in a finely comminuted form, and flashed into steam without coming in contact with the sides of the receptacle. Others are for the better combustion of the fuel consumed, and consist of devices for burning the gaseous products of combustion.

In slide valves the object seems to be to perfectly balance the valve under all circumstances, whether admitting or exhausting steam; in some of these, provision is made for the direct exhaustion of steam through an aperture in the back of the valve.

The improvements in piston-packing consist in arrangements for keeping the packing in contact with the cylinder, and for the more accurate and better construction of the joints, to prevent leakage of steam. One important feature in such packing consists in making provision for applying it to horizontal engines without disconnecting the piston rod from the cross-head, or without taking the piston out of the cylinder when one end only of the cylinder is accessible.

In automatic boiler feeders the object aimed at, is to so construct them so that they will elevate the water from a well or other reservoir, and supply it to the boiler

in such measured and exact quantities as that the water level in such boiler will be constantly at a given point, and thus prevent liability of accident from low water.

In air and gas engines the improvements are various, and in some cases important. They consist, in one class, of improvements designed to adapt them to the consumption of petroleum as fuel for heating the air to be used in the cylinder. In another class they consist in arrangements for conducting the products of combustion, mingled with a given quantity of steam, to the cylinder, there to be worked expansively for the production of motive power. In another they consist in arrangements for the manufacture of gas from petroleum and other light volatile oils, and for conveying such gas to the cylinder, where by means of an electric spark, or by means of a burner placed in a proper position, it is exploded, and its explosive force is utilized by the piston and caused to propel the machinery attached thereto.

In ejectors for oil wells, in which steam or compressed air is used as the agent to force out the oil, the improvements are varied, and consist in devices constructed upon the general principle of the Giffard injector, but are adapted to the limited space in which they are of necessity operated. These ejectors may properly be divided into two classes, one of which is more particularly adapted to the use of steam as the propelling agent, and the other to the use of compressed air as such agent.

In the first of these the instrument is at or near the bottom of the well, and steam is conveyed to it from a generator placed upon the surface, and through a pipe passing down through the seed bag or other packing of the well, sometimes within and sometimes without, but alongside the discharge pipe.

This steam induction pipe is curved at the bottom so as to give the steam an upward direction within the discharge pipe for the oil, by which means a partial vacuum is formed, and the oil rushes in and is forced up and out at the upper end of the oil pipe.

Those designed for the use of compressed air are constructed and operated in the same manner, except that they are connected with an air-compressing pump, which is capable of so compressing the atmosphere as to give it the required force for elevating the oil.

In reciprocating and rotary engines, steady if not rapid progress is being made in improving them, but these consist in the general arrangement and adaptation to certain positions and kinds of service rather than to marked improvements in their details.

In trunk engines a very marked feature is the placing of the working or induction and eduction valves, which are cylindrical in form, within the trunk, thus rendering the engine more compact and less complicated than the old form of engine.

In relation to condensers, all inventors seem to be, if not strictly orthodox, at least highly conservative, and as a consequence no very marked improvement has been made in them during the past year; but what has been done relates to modifications of the old plan and to the details thereof.

In steam and water gauges steady progress is being made, but no very marked change has been made in them recently. Considerable attention has been given to devices for removing scale from boiler tubes, several of which have been patented within the year.

With reference to other and less important devices which are included in this class, no very marked improvements have been made. So far as the aggregate of improvement is concerned, it is believed to have been at least as great the last year as it has been in any preceding one; and it is proper to say that much has been done by the inventors in this class to improve the general character of the steam engine, as well as to promote their own interests by adding very materially to the general wealth and prosperity of the country.

CLASS T.—GLASS, STONE, AND CLAY.

Some few modifications and improvements have been made in the making of glass and the tools for its manufacture. These are the most marked in the mere general substitution of machinery for hand labor, and in certain economical arrangements for the saving of fuel.

Various improvements are noticeable in the machinery for rock drilling. These principally consist of improved methods for rotating the drill, and the adjustment of it in a position more or less inclined, as the nature of the work may require.

In the machinery for the manufacture of brick, as well as the mode of preparing the materials out of which brick and tiles are made, there have been some improvements. In the apparatus for moulding the brick there is an expedient for getting them out of the moulds and into a position where they can be readily grasped by the hand and carried away, being lifted entirely out of the mould on the bottom of the same by the use of a stationary cam. The bottom is movable and on hinges, and so arranged as to throw the brick over on its thin edge.

Lime-kilns, stone-dressing, and sawing machines, clay and cement pipe machines, as well as the tools they require, have also drawn the attention of inventors, and show a decided improvement over former devices.

CLASS U.—WEARING-APPAREL.

In nothing relating to health, comfort, convenience, or taste is so little creative genius manifested as in the habiliments or costume of the American people. In disregard of all their peculiarities, of the universality of industry among them, of the variations of climate in different latitudes and localities, and of the sudden and severe vicissitudes of temperature in many regions, we accept, from social classes in Europe having no existence here, prescribed forms or fashions of apparel characterized by little else than their inappropriateness to our uses, their confined and rigid discomforts, their lack of gracefulness in form and color, and their great expensiveness. In female attire, comfortable and extravagant as it is, there are at times some expressions of taste and some independence in design; but in the garments of men, even these are not ventured; and the whole nation submits to imported examples and prescriptions without a protest, although every individual possessing either taste or judgment gives daily utterance to the impatience with which he conforms to fashions alike arbitrary and irrational.

Shirt collars had attained to the conventional standard of perfection when they became square in outline, exceedingly white, stiff to hardness, and sized and pressed until the textile character of the fabric had become almost totally concealed. At this point it became evident that the manufacture was indebted for its excellence to its close resemblance to bleached and sized paper, the substitution of which for linen was consequently attempted. For a time the attempts were attended with but limited success, partly because the resistance of a strong popular repugnance had to be encountered, and partly because paper of the required quality was not found in commerce. The use of cheap cotton cloth between sheets of paper proved successful, and the new manufacture gained its way to public favor in this form. At length paper possessing all the desired qualities was produced, and a large proportion of the collars in commerce are now made from this material.

In the past year patents have been granted for a paper collar divided at the line of turning down, but having a strip of textile material on the hidden side to turn upon the band; and its ends are in another fashioned and colored to imitate a neck-tie beneath portions of the bands. Button-holes are enlarged for the admission of buttons; back of the seat of the button when fastened auxiliary bifurcated pieces of hard material are placed behind the button-hole. Bows re-

sembling neck-ties are attached to the front button by elastic bands, wires, or clasps. Collars are turned down upon a curved or straight line by being carried through a slot of such form by a blade of rounded edge, or prepared for such fold by the pressure of a blade of like character upon the collar when lying upon a cushioned surface. A paper collar and bosom are formed in one piece or separately. Shirt bosoms are also made of flexible enamelled steel.

In hoops for skirts, clasps are formed adapted to every desired bend of the hoop. The covered wire is sized by being carried around cylinders, between sizing rollers and over heated drums. The waists of ladies' dresses are gathered upon a hoop previously adjusted to the waist of the wearer, said hoop having a groove on its exterior; and an elastic band fitting therein holds the gathered material in position.

Suspenders are attached to the shirt or connected with the shoulder braces. Shoulder braces are connected to corsets and adapted to be worn by persons engaged at machine-sewing and other employments inducing a stoop of the shoulders.

There are several modifications of buttons united to the cloth by means of clamping disks upon the shanks; others are held to the cloth by means of tongues proceeding from the collet and turned down behind the cloth, and others by rivets.

Combs are formed of fragments of material embraced in metal backs, and framed in such manner that the frame may be repeatedly fitted with a comb thus formed.

A hat frame is constructed of a series of arched stays radiating from a common centre at the crown and fastened to a ring at the brim. An irregular enlargement is made in the rear brim to admit the air into the hat. In the manufacture of hats and bonnets the block is so arranged with gearing as to present every desired part to the operator, and an arm is extended and operated in like manner for the application of the brush or other tool.

A hat body is formed of two thicknesses of material, both having minute perforations, but which are not coincident. Hats and caps are formed of woven wire, to the outside of which a fabric may be glued. Hats and caps are covered with fabrics united by caoutchouc or gutta-percha applied by heat and pressure, and also by heated moisture.

Hat bodies are stretched by being placed on rib formers and elevated between small rollers, which press the yielding material inward between the ribs and thus extend the body. A flexible band, fitting the head, but smaller than the hat, has, at intervals, pins passing through it and through small cushions into the hat body, upon which they are turned down under the outer band, thus leaving an air space between the hat and head.

Hat-brushing machines operate the brushes upon a series of hats by a cam movement, supplying the requisite heated water through the brushes by an adjustable arrangement.

Hats of flexible material are expanded into shape by means of spring hoops inserted in the periphery of the brim and in smaller circles thereof, the application of concavo-convex wire forming a special modification of this invention.

T. C. THEAKER,

Commissioner.

ALPHABETICAL LIST OF PERSONS WHOSE PATENTS FOR INVENTIONS AND DISCOVERIES HAVE EXPIRED DURING THE YEAR 1865.

No.	Patentee.	Invention or discovery.	Date.	Class.
7,896	Abbott, Theodore T.	Tires for railroad car wheels.	Jan. 24, 1851.	X.
8,501	Adams, Benjamin F.	Cutters, cheese, butter, and bread.	Nov. 11, 1851.	XVII.
8,477	Adams, Henry W.	Zinc, white use of steam to make.	Oct. 28, 1851.	IV.
8,601	Abrams, Adolph F.	Teeth, setting.	May 20, 1851.	XX.
8,692	Abrams, Adolph F.	Teeth, setting.	May 20, 1851.	XX.
8,882	Akins, William H., and J. D. Felthousen.	Sewing machines.	Aug. 5, 1851.	III.
8,382	Akins, William H., and J. D. Felthousen.	Fortery and other ware, working clay for.	Aug. 5, 1851.	XV.
8,380	Akrliff, John.	Washing machines.	Aug. 5, 1851.	XVII.
8,309	Allen, David.	Teeth, mineral, setting.	Dec. 23, 1851.	XX.
8,621	Allen, John.	Carriage tops, raising.	Jan. 14, 1851.	XX.
7,897	Allen, John L.	Harvesters, grain.	June 10, 1851.	I.
8,157	Allen, Nicholas Y.	Cloth-folding machines.	June 10, 1851.	III.
8,240	Ambrose, D. R., and O. L. Reynolds.	Rolling paper, machines for.	July 22, 1851.	XVIII.
8,619	Ames, J., and G. L. Wright.	Boilers, revolving.	Dec. 23, 1851.	VI.
8,169	Anderson, Charles.	Trunk handles.	June 17, 1851.	XVI.
7,981	Andrews, Elijah A.	Steering apparatus.	Mar. 18, 1851.	VII.
7,905	Andrews, Joseph E.	Daguerreotype pictures.	Jan. 1, 1851.	XVIII.
7,865	Anthony, Charles G.	Scythe fastenings, construction of.	Jan. 1, 1851.	I.
8,502	Anthony, David, sen.	Scythe fastenings, construction of.	Jan. 1, 1851.	XIII.
7,881	Armaly, Joshua M. C.	Corn shellers.	Jan. 7, 1851.	IV.
8,180	Armstrong, Samuel T.	Gutta-percha hollow ware.	June 24, 1851.	V.
8,732	Armstrong, Francis.	Furnaces, grate bars for.	Aug. 17, 1851.	III.
8,147	Arnold, Alonzo C.	Bags for felt cloth, &c., crossing the fibres in forming.	June 10, 1851.	VI.
7,934	Ashcroft, E. H.	Boilers, steam, insulated fuelible plug for.	June 10, 1851.	XXI.
8,198	Atwood, Charles.	Books and eyes, wire.	June 3, 1851.	XII.
8,136	Avery, Cyrus.	Horse-power.	June 3, 1851.	XII.
8,045	Avery, Samuel.	Blind slats, apparatus for operating.	Apr. 15, 1851.	VIII.
7,950	Avery, Thomas C.	Electro-magnetic engine.	Feb. 23, 1851.	II.
8,067	Babcock, Robert G.	Piano-fortes, horizontal, square.	Apr. 23, 1851.	XVIII.
8,390	Bacon, George, and Rd. Raven.	Labes.	Aug. 26, 1851.	XIV.
7,196	Bailey, T. R.	Mattresses, spring, for invalids.	July 1, 1851.	XVII.
7,882	Baird, David.	Looms for weaving bags.	Jan. 7, 1851.	III.
8,533	Baldwin, Cyrus, assignor to Stark Mills.	Sight, means of renovating and correcting.	Dec. 2, 1851.	XX.
8,049	Ball, Jonathan.	Gold amalgamator.	Apr. 22, 1851.	II.
8,344	Ball, William.	Pumps for elevating water mixed with mineral substances.	Sept. 9, 1851.	XI.
8,602	Ball, William.	Felting cloth, machinery for.	Sept. 23, 1851.	III.
8,821	Bannister, George G.	Shoe latches.	Sept. 23, 1851.	XVI.
8,381	Bannister, Isaac.	Buildings, iron, connections for the beams and columns of.	Feb. 25, 1851.	IX.
7,951	Banks, Joseph.	Mills for grinding corn and cobs.	July 22, 1851.	XIII.

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8,319	Brown, Samuel	Kilns, line	Aug. 26, 1851	XV.
8,421	Brown, William H.	Baths, shower	Oct. 14, 1851	XX.
8,217	Browning, Edwin K.	Matress stuffing, &c., machines for cutting wood into shreds and crimping them for.	July 15, 1851	XVII.
8,464	Brooks, Merrit S.	Augers, &c., to their handles, means for attaching	Oct. 28, 1851	XIV.
8,035	Broquette, Charles A.	Calico printing, material for transferring colors in	Apr. 15, 1851	IV.
8,111	Brunk, Henry	Lap anvils for shoemakers	May 27, 1851	XVI.
8,266	Bryan, William H.	Boats, to facilitate the discharge of cargoes, &c., fittings for.	July 29, 1851	VII.
8,353	Bryant, M. C.	Looms for weaving cut-pile fabrics.	Aug. 5, 1851	III.
8,036	Buckingham, John, and Joseph H. Baird, assignors to Savannah Manufacturing Company.	Milling tool.	Apr. 15, 1851	II.
8,443	Bufum, Arnold	Ore-washer	Oct. 21, 1851	II
8,321	Bukley, Charles S.	Telegraphs, means for obviating difficulties arising from defective insulation.	Aug. 26, 1851	VIII.
8,340	Bulkeley, Charles S.	Electro-magnetic telegraph circuit, changes for	Sept. 2, 1851	VIII.
8,351	Burch, J. C.	Forceps, dental	Sept. 9, 1851	XX.
8,246	Burgess, Joseph	Boot forms, machines for dressing	July 22, 1851	XVI.
8,066	Burnett, Marshall	Nail machine, horseshoe	Apr. 1, 1851	II
8,073	Burt, Charles	Harpoon, exploding	May 6, 1851	XXII.
7,925	Burt, Enoch	Looms, power, fancy check	Feb. 4, 1851	III.
8,286	Bush, O. H.	Spring bolt	Aug. 3, 1851	II
8,554	Bushnell, William	Drill, hand	Dec. 2, 1851	II
8,060	Bugbee, James R., assignor to James R. Bugbee and Enoch Robinson,	Lock and key	Apr. 27, 1851	II
202	Calderhead, Alexander	Jacquard machinery for weaving all kinds of figured cloth	(Reissue)	V.
8,542	Carleton, George W.	Stoves, cooking	Nov. 25, 1851	XIII.
8,014	Carr, J. M., and James Hughes	Bran-dusters	Apr. 1, 1851	XXI.
8,354	Carrington, Chester J.	Hooks and eyes, fastening to paper cards	Sept. 9, 1851	II
8,392	Carter, Henry, and James Reese	Nut and washer machine	Aug. 26, 1851	IV.
8,081	Cavallion, Florentine J. de	Gas, illuminating, purifying	May 6, 1851	XVII.
8,200	Cavanaugh, A. F.	Brushes and brooms, handles of	July 1, 1851	XVII.
8,310	Carver, Hiram	Cabbage cutters	Aug. 26, 1851	XIV.
8,165	Carver, Seymour	Shingles, machines for dressing	June 17, 1851	XVIII.
8,364	Chambers, Benjamin	Stamps, letter	Sept. 23, 1851	XIII.
8,339	Chapin, Nathan	Mills, cider	Sept. 2, 1851	VI.
7,935	Champion, Thomas	Boiler, steam, annular	Feb. 18, 1851	XIV.
8,330	Chapman, Thomas M.	Saw-filing machine	Sept. 2, 1851	XIV.
7,966	Chapman, Henry D.	Poles, machine for climbing	Mar. 11, 1851	XIV.
137	Cheney, Frank	Thread, machine for doubling, twisting, and reeling	Aug. 12, 1851	(Reissue)
8,288	Chichester, Lewis S.	Staves, machine for jointing	June 3, 1851	XVIII.
8,141	Chichester, Lewis S.	Carving machine	Nov. 4, 1851	XIV.
8,409	Chichester, Lewis S.	Staves, machine for dressing	Aug. 5, 1851	I.
8,270	Childs, Augustus B.	Winnowers and separators, grain	Sept. 16, 1851	V.
8,366	Chilson, Gardner	Stoves	Feb. 25, 1851	XVII.
7,952	Clapp, Edward, assignor to Edward Clapp and George Alden	Saw-irons		

7, 984	Clapp, E. S.	Scythes to the snath, fastening of.	Mar. 18, 1851	I.
8, 204	Clapp, E. S.	Scythes to the snath, fastening of.	Nov. 11, 1851	VIII.
8, 509	Clarke, Alvan	Telescopes	Sept. 23, 1851	I.
8, 373	Clarke, George B.	Churns	May 13, 1851	XIII.
8, 089	Clark, James M.	Flouring apparatus	Mar. 18, 1851	I.
7, 985	Clark, Oliver	Scythes fastening	June 3, 1851	III.
8, 134	Clausen, Peter	Fibre, vegetable, process for treating	Apr. 22, 1851	II.
8, 055	Clay, William	Rods, tapered, metallic, apparatus for rolling	July 13, 1851	III.
8, 218	Clemens, S. A.	Hemp, &c., machine for dressing Sisal	Oct. 7, 1851	X.
8, 408	Clemons, William P.	Seed-planter, devices for sowing in a	Jan. 1, 1851	IX.
7, 866	Cochran, Silas M.	Car couplings	Jan. 1, 1851	XI.
7, 867	Cole, Cyrus C.	Fences, hurdle	Nov. 25, 1851	VI.
8, 543	Collins, John B.	Pipe, lead, machines, nozzles for	Aug. 26, 1851	V.
8, 543	Collins, J. and J. G.	Boilers, apparatus for steam	Sept. 16, 1851	II.
8, 323	Colne, John P.	Glass, machine for cutting	Nov. 4, 1851	XX.
8, 578	Conant, J. S.	Gas regulators	June 2, 1851	XXI.
8, 367	Cone, N. F.	Vice, bench	July 29, 1851	V.
8, 483	Constant, Isaac	Cultivators	June 10, 1851	XIII.
8, 556	Cook, Carlos A.	Soda powders, &c., machines for crimping package papers for	Jan. 21, 1851	XIV.
8, 129	Cook, Horace, assignor to H. S. Cook and S. Colburn	Comb-cutting machines	Oct. 28, 1851	I.
8, 241	Cook, Samuel	Flour bolts	Apr. 8, 1851	XIII.
8, 938	Cook, Ransom	Fences, flexible	Apr. 8, 1851	XIV.
8, 354	Cooms, Mathias P.	Ventilating and excluding dust from railroad cars	Dec. 8, 1851	II.
8, 170	Cooper, John, administrator of Benjamin Giger	Ploughs	July 8, 1851	II.
8, 148	Corliss, George H.	Governors	Apr. 1, 1851	IX.
200	Corliss, George H.	Cut-off and working the valve of steam engines	June 10, 1851	I.
7, 868	Cornell, William E.	Planing machines for dressing the edges of boards	Jan. 21, 1851	XIII.
8, 463	Cory, Myron	Seed-planters	Oct. 28, 1851	XIV.
8, 028	Crane, Aaron D.	Horse powers	Apr. 8, 1851	I.
8, 022	Crosby, Pearson	Sawing machines	Apr. 8, 1851	XIII.
8, 564	Crosby, C. O.	Pins, mode of papering	Dec. 8, 1851	XIV.
8, 202	Crosby, C. O.	Pins, mode of papering	July 8, 1851	II.
8, 007	Crosby, C. O.	Pins, machines for sticking on paper	Apr. 1, 1851	IX.
8, 149	Crowell, Sommers	Railings	June 10, 1851	I.
8, 322	Curtis, S.	Combs, machines for cutting	Nov. 18, 1851	XXI.
8, 250	Cutler, Job	Metal tubes, method of liberating from forming mandrel	July 29, 1851	II.
8, 077	Cutting, James A.	Spark arresters	May 6, 1851	VI.
8, 271	Dane, James, Darius Healy, and Gary Cummings, assignors to Isaac and Francis Dane	Brick machine	Aug. 12, 1851	XV.
8, 297	Dare, John S.	Shoulder-braces combined with abdominal supporters	Dec. 9, 1851	XX.
8, 576	Davis, Thomas A.	Cars, railroad, running gear of	Aug. 19, 1851	X.
8, 209	Davis, A. R.	Brushes, manufacture of	Nov. 4, 1851	XVII.
8, 482	Davis, Isaac	Collars, horse, machines for forming	May 27, 1851	XVI.
8, 137	Dawes, Nathan, and Higgins Harrison	Boot-crimp	May 20, 1851	XVI.
8, 160	Day, Horace H.	Shoe, India-rubber	Apr. 15, 1851	XX.
8, 044	Dennison, Andrew	Boxes, machine for cutting out the corners and scoring edges of paper for	Nov. 18, 1851	XVIII.
8, 521	Dodge, T. H.	Printing presses	Sept. 9, 1851	IV.
8, 356	Douchet, G. F. de	Paint, manufacture of	Jan. 14, 1851	II.
7, 900	Dorwart, Joseph	Tuyeres	Jan. 7, 1851	XVIII.
7, 885	Draper, Francis	Inkstand fountain	Nov. 11, 1851	XIV.
8, 505	Drawbaugh, Daniel	Stave-jointing machine		

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8,565	Drummond, J. W., assignor to Smith Ely	Chair seats	Dec. 16, 1851	XVII.
8,566	Duchemin, Daniel and George	Clay, machines for working	Dec. 2, 1851	XV.
8,219	Dugdale, Samuel G.	Churns	July 15, 1851	I.
8,118	Duke, George B.	Carriages	May 27, 1851	X.
8,586	Dutcher, E. and W. W.	Weavers' temples	Dec. 16, 1851	III.
8,143	Dutcher, Davis	Churns	June 10, 1851	I.
8,150	Eames, Albert	Stores and other substances, machines for facing and polishing	June 10, 1851	XV.
8,107	Eames, Daniel W.	Wheels, cast-iron car	July 23, 1851	X.
8,235	Eddy, Thomas J.	Carriages, railroad, running gear of	July 23, 1851	X.
8,163	Ellis, Rufus, assignor to William M. Chase	Knitting machines	June 17, 1851	III.
7,953	Engelbrecht, Theodore F.	Hinge, double-acting spring	Feb. 25, 1851	II.
7,869	Ericsson, John	Water meters	Jan. 1, 1851	XI.
8,481	Ericsson, John	Engines, air	Nov. 4, 1851	VI.
8,579	Ericsson, John	Water meters	Dec. 9, 1851	XI.
8,063	Erner, Oliver	Winnowing machines	Apr. 23, 1851	I.
8,068	Faber, George	Boilers, &c., steam apparatus for indicating the height of water in	Apr. 23, 1851	VI.
8,361	Faber, George	Gauge for indicating pressure of steam	May 13, 1851	VI.
8,025	Fagin, Lewis, and H. C. Hayman	Bolting flour, apparatus for	Sept. 16, 1851	XXII.
8,117	Farson, Enoch L.	Swings, portable	Apr. 8, 1851	XXII.
8,587	Ferris, Richard M.	Organs and piano-fortes, combining	May 27, 1851	XVIII.
7,918	Fields, William, jr.	Hydraulic ram	Dec. 16, 1851	XI.
8,407	Fisher, Charles Frederick	Propeller, the endless chain	Jan. 28, 1851	XI.
7,870	Fisher, Daniel	Churns	Oct. 7, 1851	VII.
8,239	Flanders, J. F.	Pumps for raising water, &c.	Jan. 1, 1851	I.
8,510	Flint, Jacob C.	Hides, machine for cutting	Nov. 11, 1851	XVI.
8,261	Fonda, John C.	Flocks, machine for grinding	July 29, 1851	III.
8,030	Foster, Celia R. P., late Celia R. P. Wood	Tables, ladies' work	July 29, 1851	XVII.
8,331	Foster and Marsh, assignors to J. Foster	Wheels to axles, method of securing	Apr. 8, 1851	X.
8,484	Foster, N. G., Jessop, H. L. Brown and C. P. Brown	Seed planter	Sept. 2, 1851	X.
8,220	French, Oliver N., assignor to O. N. French and Eb. Stevens	Axle-boxes for journals for railroad cars	Nov. 4, 1851	I.
7,938	Frye, John A.	Tonguing, jointing and rebating tools for	July 15, 1851	X.
7,409	Fulton, James	Disengagement for timepieces	Feb. 18, 1851	XIV.
7,980	Gaines, Edmund F.	Mill-stones, dressing	Oct. 7, 1851	VIII.
8,465	Galliaue, Alpheus C.	Boots and shoes, machines for pegging	Mar. 4, 1851	XIII.
8,444	Gambrell, Horatio N.	Cotton duck, dressing	Oct. 28, 1851	XVI.
7,967	Gardner, P. G.	Wheels, cast-iron car	Oct. 21, 1851	III.
7,968	Gardner, Perry G.	Tires by continuous rolling, machinery for making	Mar. 11, 1851	X.
8,605	Gardner, George W.	Swaging machine, rotary	Mar. 11, 1851	II.
8,523	Gardner, James M.	Stove-grate bars	Dec. 23, 1851	II.
7,986	Gardner, James M.	Casting the backs upon the teeth of currycombs, method of	Nov. 18, 1851	II.
8,362	Gardner, Smith	Sugar, apparatus for draining	Mar. 18, 1851	IV.
8,151	Gardner, William	Governors	Sept. 16, 1851	XIII.
7,936	Garretsen, Isaac H.	Looms, hand	June 10, 1851	IX.
8,341	Gavett, H. L. F.	Fence, sod, machine for making	Feb. 18, 1851	IX.
8,389	Gilbert, T.	Piano-fortes	Sept. 9, 1851	XVIII.
			Sept. 30, 1851	

8, 311	Gillett, Bethuel, and Lyman Allis	Presses, self-acting cheese	Aug. 26, 1851	XII.
8, 060	Gilliland, Lewis L.	Splint machines	Apr. 29, 1851	XIV.
8, 348	Gillespie, G. W. C.	Ploughs, wheeled, cultivating	Sept. 9, 1851	I.
7, 871	Gilman, Samuel H.	Valve, slide method of connecting the, with the rock-shaft.	Jan. 1, 1851	VI.
7, 967	Gilman, Samuel H.	Cut-off, adjustable	Mar. 18, 1851	V.
8, 466	Gilman, Samuel H.	Bagasse, machines for drying	Oct. 28, 1851	II.
8, 559	Goffin, F. C., assignor to Charles J. Gayler	Lock for safes, &c	Dec. 2, 1851	XXII.
8, 524	Goldson, Henry	Floughs	Nov. 23, 1851	XVIII.
8, 544	Goldthait, Elijah	Ships, light	Nov. 23, 1851	XV.
7, 927	Goodrich, Leonard	Ice, process for artificial production of	Feb. 4, 1851	I.
8, 060	Gorrie, John	Writing, apparatus for giving ease to the arm in	May 6, 1851	VII.
8, 065	Goshen, Joseph G., and William H. Towers	Stone-drilling machine	Apr. 29, 1851	XXIII.
8, 363	Goulding, Henry	Tuyere, tight joint for	Sept. 16, 1851	XV.
8, 368	Graham, William	Stoves, air-tight, Franklin	Aug. 5, 1851	II.
7, 973	Grauger, Rensselaer D	Stoves, cooking	Mar. 11, 1851	V.
8, 050	Grannis, Charles W	Brick presses	Apr. 22, 1851	V.
8, 093	Grant, Joseph	Bedstead rails, machine for cutting screws on	May 13, 1851	XV.
8, 019	Grass, H., and William Campbell	Piano-forte action	Apr. 1, 1851	XVII.
8, 332	Gray, James A	Brick machines	Sept. 9, 1851	XVIII.
8, 284	Gregg, Isaac	Brick machines	Aug. 5, 1851	XV.
8, 158	Gregg, Mahlon	Equalizers or power-regulators	June 17, 1851	XV.
8, 345	Gregory, Alfred	Stoves, cooking	Sept. 9, 1851	VI.
7, 975	Greer, James, and Rufus J. King	Iron, measuring and cutting	Mar. 11, 1851	V.
8, 465	Griffith, Levi B.	Locomotive, running gear of	Nov. 4, 1851	II.
8, 166	Griggs, George S	Hemp and flax, machines for scutching and backling	June 17, 1851	X.
8, 374	Grimes, Owen W	Broom corn, machines for stripping seed for	Sept. 23, 1851	III.
8, 375	Grosvenor, L. D.	Broom corn, machine for assorting	Sept. 23, 1851	I.
7, 872	Grosvenor, Lorenzo D	Steam traps	Jan. 1, 1851	I.
8, 132	Guard, Chauncy H	Springs, carriage	June 10, 1851	X.
8, 103	Guild, Charles M., and John Brown	Window curtain fastening	May 20, 1851	V.
7, 971	Guver, Hugh	Lock, bank, powder-proof	Mar. 11, 1851	XVII.
8, 227	Hall, William	Corks, machine for cutting	July 29, 1851	II.
8, 422	Hammer, George	Desks	Oct. 14, 1851	XVII.
8, 486	Hammitt, John T	Key swivel, nibbed	Nov. 4, 1851	II.
7, 917	Hanley, James	Mill-stones	Jan. 28, 1851	XIII.
8, 037	Hanon, Valeke E. T.	Hooker-up, mechanical	Apr. 13, 1851	II.
8, 204	Harpersett, David J	Spoke machines, hook-heading motion for	July 8, 1851	II.
8, 342	Hardaway, Mure	Propellers of machinery, to be used in currents	Sept. 9, 1851	XI.
8, 355	Hardie, James	Stoves, double oven	Nov. 18, 1851	V.
7, 932	Harris, C., and P. W. Zoner	Motion, changing reciprocating into a rotary	Sept. 2, 1851	XIII.
7, 962	Harris, Joseph, Jr.	Dental hydraulic cups	Jan. 14, 1851	XX.
8, 312	Harrison, James	Looms, cylinders for figuring	Aug. 26, 1851	XX.
7, 968	Hastings, Eliakim M., and John Sheperdson	Pens for ruling paper	Mar. 18, 1851	III.
7, 920	Hathaway, Alfred	Printing presses	Jan. 28, 1851	XVIII.
8, 445	Hathaway, John K., and John P. Strippel	Ventilators	Oct. 21, 1851	V.
8, 167	Hatch, Thatcher C.	Stave dressing machines	June 17, 1851	XIV.
8, 245	Hawkins, William	Carriages	July 22, 1851	X.
8, 568	Hausknecht, Gustavus L.	Springs, carriage	Dec. 16, 1851	X.
8, 521	Hausknecht, Gustavus L.	Kettles and articles of like character from disks of metal, machinery for making	July 15, 1851	X.
8, 159	Hayden, Hiram W	Mill-stones, machinery for dressing	Dec. 16, 1851	(Extension)
8, 364	Hazard, E. W., and C. H. Jenner	Mill-stones, machinery for dressing	Sept. 16, 1851	XIII.

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8 106	Hobbard, Albert.	Wheels, cast-iron car.	May 20, 1851	X.

8,256	McCarthy, James.....	Boiler tubes, &c., spring expanding swage for	July 23, 1851	VI.
8,324	McGloskey, D. W. C.....	Lamps, self-acting blow-pipe	Aug. 26, 1851	V.
8,492	McConnell, W. P.....	Charcoal, manufacture of	Nov. 4, 1851	V.
8,016	McCarthy, David.....	India-rubber, manufacture of	Apr. 1, 1851	IV.
8,903	McFarlane, George R.....	Wheels, cast-iron car	Jan. 14, 1851	X.
8,124	McFarlane, Wm. A., and Thomas C. Carpenter	Bran-dusters	May 27, 1851	XIII.
8,314	McGregor, Geo., Robert Lea and Thomas G. Clinton	Padlocks	Aug. 26, 1851	II.
8,010	McKinley, Peter.....	Hallers, rice	Apr. 1, 1851	X.
8,610	McLean, John.....	Harness, saddles	Dec. 23, 1851	XVI.
8,449	Need, Charles L.....	Wind instruments, the mouth-piece for	Oct. 21, 1851	XVIII.
8,017	Nellish, Henry.....	Splint machines	Apr. 1, 1851	XIV.

Patent No.	Inventor	Process	Date	Class
8,308	Mercer, John	Fulling vegetable and other texture, chemical processes for	Aug. 19, 1851	III.
8,307	Merrick, Solomon	Screw wrench	Sept. 23, 1851	XIV.
8,376	Merrill, William	Lath machines	Apr. 8, 1851	I.
8,031	Merrill, Rosewell T.	Grain separators and fans	Oct. 21, 1851	IV.
8,450	Miller, James M.	Sugar vacuum pans	July 1, 1851	XVIII.
8,194	Miller, Michael	Piano-fortes	July 15, 1851	I.
8,225	Miller, Sylvanus	Harvesting machines, rake to	Nov. 4, 1851	XVI.
8,500	Miligan, Wm. B.	Hides, tanning and tanning	July 15, 1851	VI.
8,226	Miligan, Wm. E.	Boilers, steam, management of the flues and water-spaces of	Apr. 1, 1851	IX.
8,011	Monson, Charles	Blasting rocks	July 29, 1851	X.
8,263	Moore, Henry	Hubs for the reception of boxes	Dec. 2, 1851	X.
8,561	Moore, Jos. H., and Wm. P. Parrott	Carriage, steam, for railings	Sept. 30, 1851	XII.
8,393	Moore, William	Presses, self-acting	Nov. 23, 1851	VII.
8,546	Mortimer, Thomas H., and James M. Garduer	Ruders, method of operating	Sept. 2, 1851	XVIII.
8,735	Moulson, John	Photographic purposes, mercury bath for	Oct. 21, 1851	X.
8,410	Murrill, James H.	Locomotives, running gear of	Jan. 7, 1851	I.
8,451	Murrill, James H.	Cars, railroad, running gear of	Jan. 7, 1851	VIII.
8,588	Neely, Edward	Harvesters, grass	Oct. 14, 1851	III.
8,889	Neff, Jacob	Electro-magnetic engines	May 27, 1851	XII.
8,424	Nemith, John and Wesley Sawyer	Shawls, &c., machine for twisting filings of	Nov. 11, 1851	XVII.
8,110	Newbury, Bolivar	Jacks, lifting	June 10, 1851	II.
8,516	Newcomb, Levi, jr.	Bedsteads	Oct. 14, 1851	XIII.
8,298	Newell, Robert	Manifold permutation locks	May 6, 1851	XI.
8,145	Newell, Robert	Locks, permutation safety	Oct. 21, 1851	XVIII.
8,425	Newlove, William	Mills, grinding	Nov. 25, 1851	II.
8,078	Newman, Nelson	Pumps	Sept. 30, 1851	II.
8,452	Newton, Henry J.	Piano-forte strings	Aug. 26, 1851	XIV.
8,547	Newton, Orrin	Door-knobs, manufacture of	Dec. 2, 1851	VIII.
8,266	Nicholson, Thomas	Lock maze	Nov. 18, 1851	XVII.
8,315	Niles, Peter H.	Tool haft, adjustable	Dec. 2, 1851	VI.
8,611	Nims, Samuel D.	Sashes, window, method of hanging	June 10, 1851	XVII.
8,577	Noel, Theodore	Watches, winding	Feb. 11, 1851	XI.
8,240	Norris, J. H., and D. Flanders	Disks	June 3, 1851	II.
8,876	Northrop, Sheldon	Looms for weaving seamless bags	Mar. 4, 1851	VI.
8,399	Norron, Michael	Sash lock	June 10, 1851	XVII.
8,961	Nystrom, John W.	Calculating machines	Sept. 23, 1851	XVII.
8,962	O'Neil, Bernard	Boilers, method of bracing the water spaces of	Feb. 11, 1851	XI.
8,57	O'Neil, John	Churns	June 3, 1851	II.
8,153	O'Neil, John	Washing machines	May 20, 1851	XI.
8,377	O'Neil, Patrick	Easy chairs for invalids	Aug. 26, 1851	I.
8,932	Osborn, John	Hydraulic rams, operating the waste gate in	Aug. 26, 1851	VIII.
8,135	Osborn, Joseph	Sash stopper	Aug. 26, 1851	I.
8,696	Osgood, James W.	Coupling compound for hose or pipe	Aug. 26, 1851	VIII.
8,313	Ostrander, John F., assignor to A. B. and E. E. Hutchinson	Harrow, rotary	July 1, 1851	VIII.
8,316	Otto, George W.	Lighting-rods, insulators for	Apr. 8, 1851	V.
8,99	Pace, Henry, sen	Bedsteads	July 15, 1851	XVI.
8,191	Paine, John F.	Spectacle frames	Jan. 21, 1851	I.
8,634	Paine, Rufus R.	Stoves, cooking	Oct. 14, 1851	XI.
8,227	Panton, William	Leather, machines for splitting	Sept. 30, 1851	XVII.
8,910	Parker, E. T.	Plough stock, convertible		
8,423	Parker, James L.	Water wheels		
8,395	Parsons, Lemuel H.	Plotting scales		

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8,128	Post, John C.	Switch for railroads, self-adjusting and locking.	June 2, 1851	X.
8,292	Pattinson, H. L.	Pigments, manufacture of	Aug. 12, 1851	IV.
8,612	Patton, James M., and Wm. F. Fergus, assignors to John C. DeCosta.	Planing machines, cutters for	Dec. 23, 1851	XIV.
8,471	Pease, Webster H.	Kettles with spouts, method of moulding.	Oct. 28, 1851	II.
8,548	Peck, Milo	Presses, drop.	Nov. 25, 1851	(Extended)
7,800	Pemington, Cunningham M.	Bridge-trusses, arrangement of arches in.	Jan. 7, 1851	IX.
7,930	Pemock, Samuel, and Morton	Planter's seed, sowing apparatus of a	Feb. 11, 1851	I.
7,945	Pepper, John, assignor to Charles Warren and Horatio G. Sauterli.	Knitting machines	Feb. 25, 1851	III.
8,172	Pepper, John, assignor to Horatio Crane, John Pepper, and J. G. Crane.	Knitting machines	June 24, 1851	III.
8,592	Pepper, John Paige	Jasper, mineral composition resembling	Dec. 16, 1851	XVIII.
8,506	Perry, George W.	Looms, shuttle, motion of	Nov. 11, 1851	III.
8,304	Peterson, Ira B., and Joel L. Brockel.	Omnibus drivers, registers for	Aug. 13, 1851	X.
98	Phannor, Frederick	Dysentaria from spent madder, preparation of (Additional Improvement)
136	Phelps, James.	Paper rags, machines for cleaning (Rebate)
8,531	Phillips, David F.	Switch, railroad	Nov. 18, 1851	X.
8,549	Phillips, David F.	Mills, elder	Nov. 25, 1851	XIII.
8,104	Pierce, Samuel	Furnaces, hot-air	May 20, 1851	V.
8,097	Platt, Nelson	Shut machines	May 20, 1851	XIII.
7,948	Pond, Mosee	Ranges, cooking	Feb. 5, 1851	V.
8,210	Porter, P. W.	Fire-arms, revolving breech	July 8, 1851	XIX.
8,582	Porter, Samuel	Ores, mineral, &c., arrangement of pans for washing	Dec. 9, 1851	II.
7,940	Post, William	Doors or shutters, attachment for opening or closing	Feb. 18, 1851	II.
8,171	Postley, Charles A.	Frog-guard, self-acting	June 24, 1851	IX.
8,629	Potter, Nathaniel	Beehives, use of slides in	Mar. 11, 1851	I.
8,405	Pratt, Ulysses	Flocks to cloth, apparatus for applying	July 6, 1851	IV.
8,269	Prince, N. A.	Peas, fountain	Oct. 7, 1851	III.
8,113	Prutium, George W.	Saw-filing machinery, vice-jaw for	Sept. 30, 1851	XVIII.
8,403	Putnam, Joseph	Clay pipes, manufacture of	May 27, 1851	XIV.
8,186	Race, W.	Shed, upper, arrangement of catches in the, operated by moving the lower shed.	Sept. 30, 1851	XV.
8,387	Race, Washbourn	Fasteners, blind or shutters	Sept. 23, 1851	II.
8,557	Raines, William N.	Switches, railroad	Dec. 2, 1851	X.
8,532	Kedrick, William	Seed planters	Nov. 18, 1851	I.
9,086	Ramos, Juan	Sugar, processes for the manufacture of	Apr. 29, 1851	IV.
9,087	Ramos, Juan	Sugar, apparatus for boiling	Apr. 29, 1851	IV.
8,453	Reiny, Benjamin W.	Excavating machines	Oct. 21, 1851	IX.
8,613	Renyon, James	Iron wrought direct from the ore, apparatus for making	Dec. 23, 1851	II.
184	Reynolds, Edward	Fellies for the wheels of carriages and wagons, machine for setting or bending. (Rebate)
8,053	Reynolds, James	Gutta-percha tubing and covering wire, machines for	Apr. 22, 1851	IV.
7,941	Rhodes, Philip, Jr.	Snatch-block	Feb. 18, 1851	VII.

2	Rice, E.	Baby-jumpers	Oct. 28, 1851	XXII.
3	Rich. Martin	Saw-mills	May 13, 1851	XIV
4	Richardson, Aaron	Oil-cups for journal boxes	July 29, 1851	XIII.
5	Richards, William T.	Springs, machinery for forming joints of elliptical	Aug. 26, 1851	II.
6	Richardson, A.	Leather and splitting machines	Sept. 16, 1851	XVI.
7	Richardson, Rhinel S.	Churns	June 10, 1851	I.
8	Richards, David H., and Joseph F. Flanders.	Locks, rotating tumbler	Dec. 16, 1851	II.
9	Rickey, Richard	Collars, horse	Nov. 11, 1851	XVI.
10	Riddle, John J.	Brick machines	July 22, 1851	XV.
11	Riddle, John J.	Brick presses	Apr. 1, 1851	XX.
12	Riley, William Willshire	Teeth, porcelain, inserting	Nov. 18, 1851	II.
13	Ripley, Ezra	Hinge crane, for doors, shutters, &c.	May 13, 1851	XIII.
14	Ripley, Ezra	Grinders, method of forming teeth upon cast-iron	Aug. 12, 1851	X.
15	Riley, E., and E. L. Brundage.	Car seats	Dec. 9, 1851	XIV.
16	Robbins, John W.	Saw-mills, setting logs in	Apr. 15, 1851	XXII.
17	Robbins, Jabez, assignor to Joel R. Morse.	Horn and shell, machines for splitting	June 24, 1851	(Extended)
18	Robins, L. S.	Paint oil from rosin	Nov. 4, 1851	(Extended)
19	Robbins, L. S.	Acid and naphtha from rosin, distilling	Nov. 4, 1851	(Extended)
20	Robbins, L. S.	Oil from rosin, lubricating	Nov. 4, 1851	(Extended)
21	Robbins, L. S.	Oil from rosin, tanners'	Nov. 4, 1851	(Extended)
22	Robbins, Zeous C.	Telegraph wires, insulators for	Oct. 14, 1851	IV.
23	Roberts, Cyrus, and John Cox	Grain, thrashing and separating	Oct. 28, 1851	VIII.
24	Robertson, John	Lead machines, sheet, combination of dies for	May 27, 1851	I.
25	Rockwood, Francis A.	Candlesticks	Dec. 16, 1851	II.
26	Rockwood, Levi R., assignor to Joseph L. Woodward.	Last blocks, fastenings for	Sept. 16, 1851	V.
27	Rose, H. R.	Stoves	Nov. 18, 1851	XVI.
28	Ross, James P.	Planters, seed	Jan. 1, 1851	V.
29	Root, James	Shutters for shop fronts	Aug. 5, 1851	I.
30	Root, James	Stoves, folding doors of	Nov. 4, 1851	IX.
31	Rowe, Bradford	Leather, machines for stretching	Nov. 4, 1851	V.
32	Rock, John	Piano-forte action	Apr. 22, 1851	XVII.
33	Reid, William T.	Designs in sheet metal, apparatus for punching	Mar. 7, 1851	XVIII.
34	Reiches, H. J.	Grates, stove	July 8, 1851	II.
35	Reiches, Stephen P.	Printing presses	Nov. 18, 1851	V.
36	Reiches, Stephen P.	Stamps, hand	Jan. 1, 1851	XVIII.
37	Russell, Charles W.	Chimney caps	Sept. 23, 1851	XVIII.
38	Russell, Ira	Bedsteads	Dec. 16, 1851	V.
39	Russell, Jonathan	Bedsteads	Sept. 16, 1851	XVII.
40	Rutten, Henry	Irregular forms, machines for turning	Jan. 1, 1851	XIV.
41	Sabbe, H. W., and George Drew.	Furnaces, ventilating	May 20, 1851	V.
42	Sabbe, H. W., and George Drew.	Hinges, spring	Feb. 25, 1851	II.
43	Sabin, Harvey W.	Bedsteads	July 1, 1851	XVII.
44	Salomon, John C. Fr.	Saddles	Oct. 21, 1851	XVII.
45	Salomon, John C. Fr.	Spring saddles	Nov. 18, 1851	XVII.
46	Salomon, John C. Fr.	Propelling and steering, apparatus for	Dec. 2, 1851	VII.
47	Salomon, John C. Fr.	Engines, carbonic acid gas	Dec. 9, 1851	VI.
48	Saunders, Hugh and James	Lamps, street, reflectors for	Jan. 14, 1851	V.
49	Saunders, Hugh and James	Lanterns	June 10, 1851	II.
50	Saunders, Charles G., and Robert Thompson.	Waste-pickers	Sept. 16, 1851	XIII.
51	Sawyer, Sylvanus	Ratans, machinery for cutting, &c.	June 24, 1851	(Reissue)
52	Searritt, Russell	Sofa bedsteads	Jan. 21, 1851	XV.
53	Schellert, Jacob	Brick presses	Feb. 11, 1851	IX.
54	Schofield, Charles, and George J. Johns	Serpier		

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8,079	Schroder, Richard E.	Kilns, line	May 6, 1851	XV.
7,990	Scott, John, and John Tamahill	Jacquard machines	Mar. 18, 1851	III.
8,411	Scott, William	Boilers, revolving	Oct. 7, 1851	VI.
8,176	Selgrath, Jacob	Compounds, lubricating	June 24, 1851	IV.
8,187	Serrell, Alfred T.	Mouldings, machinery for making	(Reissue)	
8,455	Serverson, Benjamin	Wheels, cast-iron car	Oct. 21, 1851	X.
8,373	Sexton, Amos J., and William Emml	Ores, ventilating	Sept. 23, 1851	VII.
8,208	Seymour, E. L.	Steps, processes of reducing by zinc compound	Aug. 26, 1851	II.
8,212	Seymour, William H.	Harvesting machines, rakes to	July 8, 1851	I.
8,249	Siuder, Reuben	Dyeing floor-mats	July 22, 1851	IV.
8,430	Sheetz, Edmund	Water-wheels, overshot	Oct. 14, 1851	XI.
201	Sherrwood, John P., assignor to Calvin Adams	Door locks	(Reissue)	
8,326	Sherrwood, John P.	Cut-nail machines	Aug. 26, 1851	II.
8,362	Sherrord, Walter	Mandrels, expanding	Dec. 2, 1851	XIV.
7,891	Shields, James, and Samuel Pierce	Stoves, coal	Jan. 7, 1851	V.
8,259	Short, S-well	Window-sashes	July 29, 1851	IX.
8,614	Shull, Thomas E.	Tampins, method of setting up	Dec. 23, 1851	XXII.
7,893	Simpson, Andrew L.	Ox-yokes	Jan. 7, 1851	I.
7,892	Simpson, Samuel R.	Vise, parallel	Jan. 7, 1851	I.
8,294	Singer, Isaac M.	Sewing machines	Aug. 12, 1851	III.
8,550	Skinner, Franklin	Shingle machines	Nov. 25, 1851	XIV.
8,596	Skinner, Henry	Churns	Dec. 16, 1851	I.
8,431	Slaight, Thomas	Padlock	Oct. 14, 1851	II.
7,958	Sloan, Thomas J.	Screw-blanks, machine for arranging and feeding	Feb. 25, 1851	II.
8,027	Sloan, Thomas J.	Tampins, apparatus for setting up	Apr. 8, 1851	XXII.
8,082	Sloan, Thomas J.	Screw-blanks, &c., machine for assorting	May 6, 1851	II.
8,155	Sloan, Thomas J.	Screws, method of finishing the heads of	June 10, 1851	II.
8,379	Sloan, Thomas J.	Screws, machinery for threading wood, and feeding apparatus therefor	Sept. 23, 1851	II.
8,397	Sloan, Thomas J.	Screw-blanks and articles of a similar character, machine for arranging	Sept. 30, 1851	II.
8,456	Sloan, Thomas J.	Screws, machinery for shaving, nicking, and reshaving wood	Oct. 21, 1851	II.
8,615	Sloan, Thomas J.	Screws and pins, machines for counting	(Extended)	
186	Smith, Edward N., assignor through others to American Paper Folding Company.	Paper-folding machines	Dec. 23, 1851	(Reissue)
7,914	Smith, Elihu	Stoves	Jan. 24, 1851	V.
8,317	Smith, Horace, assignor to Cornland Palmer	Fire-arms, breech-loading	Aug. 27, 1851	XIX.
8,066	Smith, Ira H., assignor to Lemuel D. Smith.	Matches, machinery for making	Apr. 29, 1851	XIV.
8,064	Smith, Joseph C.	Saddles, springs	Apr. 29, 1851	XVI.
7,947	Smith, Marion	Musical instruments, bellows for	Feb. 25, 1851	XVIII.

7,963	Snow, Henry H.	Peppermint droppers	Mar. 4, 1851	IV.
7,955	Sours, William	Stoves, cooking	Feb. 23, 1851	V.
6,343	Southwood, Eli F.	Sails, method of making	Sept. 9, 1851	VII.

7,942	Southworth, Daniel H.	Planing machines	Feb. 18, 1851	XIV.
7,401	Sparr, Matthew	Mitre-boxes	Sept. 30, 1851	XIV.
7,908	Speers, N. W.	Shutters, &c., apparatus for moving and securing	Mar. 25, 1851	II.
7,357	Speers, Noah W.	Blind and shutter, operating	Dec. 16, 1851	II.
7,130	Spencer, James C.	Carriages	May 27, 1851	X.
7,729	Spicker, Charles F.	Gold, process for dissolving	Aug. 1, 1851	II.
7,043	Spoor, A. D.	Gate-bars, agitating	Apr. 15, 1851	V.
7,337	Stanley, Edwin	Bridges, the construction of	Sept. 2, 1851	IX.
7,305	Stanley, Hartwell	Boot-cramps	Aug. 19, 1851	XVI.
7,616	Starks, Nathan	Bolt-heading machines	Dec. 23, 1851	II.
7,911	Starr, Charles	Embossing backs of books, tools for	Jan. 21, 1851	XVIII.
7,179	Starr, Vinc B.	Books, machines for finishing backs of	June 24, 1851	XVIII.
7,237	Starr, William H.	Gauges	Nov. 18, 1851	XVII.
7,182	Stearns, Charles W.	Hayvesters, grain	June 24, 1851	I.
7,633	Stearns, Charles W.	Glogs, or pattens	Apr. 22, 1851	XVI.
7,257	Stearns, Charles W.	Faucets	July 22, 1851	XI.
7,213	Stearns, John	Plats, machine for pressing	July 8, 1851	XXI.
7,228	Stebbins, Erasmus	Faucets, or gates, molasses	July 15, 1851	XI.
7,507	Stegar, Joseph, assignor to William Mitchell	Boots and shoes, machines for cutting soles of	Nov. 11, 1851	XVI.
7,474	Stephan, Jacob, assignor to P. Augustus Searuze and Jacob Stephan	Cements, for grinding, cyhluders	Oct. 28, 1851	IV.
7,522	Stevens, Francis A.	Car-brakes, railroad	Nov. 25, 1851	(Extended)
7,403	Stevens, Francis B.	Valves, balanced	Mar. 25, 1851	VI.
7,339	Stevens, Richard P.	Liquids, apparatus for drawing and measuring	Mar. 25, 1851	XI.
7,452	Stevens, Joel and H. J. Rugelles	Stoves, dairy	Oct. 28, 1851	V.
7,412	Stevens, Joshua, assignor to Massachusetts Arms Company	Pistols, revolving breech	Oct. 7, 1851	XIX.
7,915	Still, Francis N.	Patterns, mitre, or second, for casting	Jan. 28, 1851	II.
7,905	Stillman, Paul	Gauges, steam and vacuum	Apr. 22, 1851	(Reinst)
7,629	Stillwell, Tickson, and Edwin L. Brudage	Car seats	Dec. 2, 1851	X.
7,508	Stillwell, Lewis F.	Carringe perches	May 6, 1851	VII.
7,074	St. John, John R., assignor to James Renwick, George T. Barnard, and E. B. St. John, trustees of the St. John's Compass and Log Company	Hand-logs	May 13, 1851	VII.
7,085	St. John, John R., assignor to James Renwick, George T. Barnard, and E. B. St. John, trustees of the St. John's Compass and Log Company	Velocimeters, aquatic, method of supporting the vanes of	May 13, 1851	VII.
7,214	St. John, James	Jacks, lifting	July 8, 1851	XII.
7,443	St. John, L. C.	Dwelling, apparatus for warming air and water for	Oct. 7, 1851	V.
7,007	St. Johns, John R.	Soap boilers	June 6, 1851	IV.
7,392	Stearns, William M.	Power, motive, method of obtaining	Feb. 4, 1851	VI.
7,079	Stearns, William M.	Vessels, flexible hose, or float, for supporting	Apr. 29, 1851	VII.
7,580	Stearns, William M.	Engines, in which compressed air or other gas heated and expanded by admixture therewith of a heated fluid is used as the motive agent	Sept. 23, 1851	VI.
7,473	Stout, Thomas B., and James F. Morrell	Ycars and ways, machines for taking	Oct. 28, 1851	XXII.
7,518	Stover, J. S.	Kilns, grain	Nov. 11, 1851	VI.
7,072	Strait, Hiram	Saw-set	Apr. 8, 1851	XIV.
7,423	Strait, J. V.	Motion, mode of changing reciprocating into rotary	July 22, 1851	XIII.
7,943	Streedy, Isaac	Saw-mills	Feb. 18, 1851	XIV.
7,054	Street, William, and Daniel Brown	Leather, machines for stretching	Apr. 22, 1851	XVI.
7,209	Strode, Thomas T.	Tanning, hides in posts	Dec. 9, 1851	XIV.
7,315	Stungis, John J., assignor to H. H. Green	Type-casting machines	Sept. 9, 1851	XVIII.

List of persons whose patents for inventions have expired, &c.—Continued.

No.	Patentee.	Invention or discovery.	Date.	Class.
8,084	Sullivan, Jonathan.	Straw cutters.	May 13, 1851	I.
7,391	Surles, A. J.	Beehives, construction of.	Mar. 18, 1851	I.
8,338	Sweet, James H.	Spoke machinery.	Aug. 30, 1851	II.
8,494	Swiney, Edward.	Dyeing blue, processes for.	Nov. 4, 1851	IV.
8,157	Taft, George C.	Box opener.	Oct. 21, 1851	XXIII.
8,519	Taylor, Isaac.	Glass, frosting plates of.	Nov. 11, 1851	XV.
7,900	Thatcher, George H.	Stoves.	Jan. 21, 1851	V.
8,332	Thatcher, George H.	Fountain and evaporator combined.	July 23, 1851	V.
8,263	Thatcher, George H.	Stoves with portable ovens.	July 29, 1851	V.
8,277	Thatcher, George H.	Grates, quadrant-hinged.	Aug. 20, 1851	V.
7,907	Thompson, Ambrose W.	Propeller.	Jan. 21, 1851	VII.
7,926	Thompson, Henry G.	Packing of rotary engines, method of adjusting the.	Aug. 5, 1851	VI.
7,997	Thorn, Lewis.	Tables, extension.	Feb. 4, 1851	XVII.
8,414	Thornley, O.	Bedsteads, machines for cutting screws on posts and rails of.	Mar. 25, 1851	XVI.
8,508	Thorpe, Joseph W.	Carpeting, apparatus for pressing.	Oct. 7, 1851	XVI.
8,318	Tilton, David, assignor to Tilton & Sweetser.	Padlock.	Dec. 16, 1851	XVI.
8,458	Tilton, Joseph V.	Stane, machines for dressing.	Aug. 26, 1851	II.
8,338	Tilton, Wm. B.	Violins, &c., construction of.	Oct. 21, 1851	XV.
7,992	Timby, Theodore R.	Saddlons, removable handles to.	Sept. 2, 1851	XVIII.
8,783	Truher, Harris II.	Suspender, encircling, for garments.	Mar. 18, 1851	XVII.
8,538	Toth, George.	Mill-stones, finishing and balancing.	Dec. 3, 1851	XVI.
8,249	Todd, Wm., assignor to Charles Atwood and Geo. Kellogg.	Jack-chains, tools for making.	Nov. 18, 1851	XIII.
8,584	Tollumst, G. W.	Lath machines.	Apr. 8, 1851	II.
8,406	Toye, Nathaniel C.	Tanning.	Dec. 9, 1851	XIV.
8,509	Tracy, Samuel F.	Ores, copper, processes for smelting.	Oct. 7, 1851	XVI.
8,360	Treat, James S., and Stephen Randall.	Hemp and flax, machines for breaking and reducing the length of fibres.	Dec. 16, 1851	II.
8,276	Treat, Joseph C.	Furnaces, hot-air.	Sept. 16, 1851	III.
7,880	Trotter, Jonathan T.	India-rubber, manufacture of.	Aug. 5, 1851	V.
8,430	Tucker, Hiram.	Marble imitating.	Jan. 1, 1851	IV.
8,617	Tucker, Richard S.	Spinning rope-yarns.	Oct. 14, 1851	XVIII.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
50, 789	Beach, H. H.	Rome, N. Y.	Dryer, grain.	Nov. 7, 1865.
47, 694	Beadle, J. Lowden.	Ashland, Pa.	Ventilating of mines.	May 16, 1865.
49, 365	Beaire, Joseph. (See Van Kannel, Theophilus, assignor.)			
49, 365	Beall, John, and Samuel K. Shaffer.	Decatur, Ill.	Bolts, flour.	Aug. 15, 1865.
46, 207	Beals, Fordyce.	New Haven, Conn.	Cartridge, retractor for breech-loading fire arms.	Feb. 7, 1865.
48, 803	Beals, Isaac N.	Middleboro', Mass.	Washing machine.	July 25, 1865.
50, 550	Beals, J. S.	Alabam Centre, N. Y.	Racks, sheep.	Oct. 24, 1865.
51, 383	Beaulieu, P. W. (See Dexter, T. B., assignor.)			
51, 383	Beam, Edwin E., assignor to self and Jacob Chickering.	Abington, Mass.	Sewing machines, waxed thread, chain-stitch.	Dec. 5, 1865.
46, 419	Benson, E., and C. W. Finsel, assignors to selves and T. A. Havenyter.	England.	Sugar boiling.	Feb. 14, 1865.
46, 644	Beard, George.	Salineville, Ohio.	Measures for the human body.	July 11, 1865.
47, 918	Beardslee, George W.	College Point, N. Y.	Conducting wires, coupling.	May 30, 1865.
46, 334	Beardsley, Rowland J.	Brooklyn, N. Y.	Caster for furniture.	Feb. 14, 1865.
50, 676	Beary, David.	New Castle, Ind.	Saws, cross-cut, to their handles, attaching.	Oct. 31, 1865.
50, 986	Beatty, David, assignor to James J. Hamilton.	New Castle, Ind.	Meat cutter.	Nov. 14, 1865.
48, 894	Beaton, William.	Grimmell, Iowa.	Washing machine.	July 25, 1865.
48, 357	Beatty, John P.	Norwalk, Conn.	Eds.	June 27, 1865.
48, 012	Bechtel, William H., assignor to self and B. H. Bartol.	Philadelphia, Pa.	Wells, boring.	May 30, 1865.
	Beck, William. (See Valentine & Ridout, assignors.)			
	Beck, William. (See Valentine & Ridout, assignors.)			
	Beck, William. (See Valentine & Ridout, assignors.)			
	Becker, Vroman, and James Kline. (See Kline & Becker.)			
51, 412	Beckman, H. B.	Newburyport, Mass.	Engines, steam, automatic stop motion for.	Dec. 12, 1865.
51, 669	Beckwith, James R.	Windham, Conn.	Paper-cutting machine.	Dec. 19, 1865.
51, 413	Beckwith, James R., deceased, by William Smith, executor.	New Orleans, La.	Fibrous plants from pulpy matter, machine for separating.	Dec. 12, 1865.
50, 790	Beckwith, L. H., et al. (See Colgan, Michael, assignor.)	Cleveland, Ohio.	Granaries and fruit houses.	Nov. 7, 1865.
49, 965	Bedell, Otis F.	New York, N. Y.	Picture frames, machine for bevelling.	Sept. 19, 1865.
48, 507	Bedell, O. F.	New York, N. Y.	Egg holder and packer.	July 4, 1865.
49, 508	Bedson, George.	Great Britain.	Wire, apparatus for rolling.	Aug. 22, 1865.
49, 700	Bee, Benjamin F.	Harwich, Mass.	Dice, instrument for throwing.	Sept. 5, 1865.
46, 966	Becke, James P., and Levi M. Sanford. (See Sanford & Beebe.)	New York, N. Y.	Sawing machines.	Mar. 21, 1865.
	Beckman, A., assignor to Theodore and Charles Wenzel.			
47, 919	Beers, Charles C. (See St. John, C., assignor.)			
49, 847	Beers, Horace, assignor to self and Smith & Burnham.	Brookfield, Conn.	Hay spreaders.	May 30, 1865.
	Beers, John D.	Philadelphia, Pa.	Steam generators.	Sept. 12, 1865.
	Beers, Philo S.	Hartford, Conn.	Turning irregular forms, machine for.	Feb. 11, 1865.
48, 895	Beers, Wheeler.	Bridgeport, Conn.	Vehicles, axles for.	July 25, 1865.
49, 970	Behel, Jacob.	Rockford, Ill.	Reaping machines, binding attachments to.	Sept. 19, 1865.
47, 384	Behr, Adolph, and William James Ward.	Black Hawk, Colorado Ter.	Analagunating gold, &c., shaking and rocking table for.	Sept. 25, 1865.
50, 326	Behrens, Henry I.	New York, N. Y.	Ore crushing stamps.	Oct. 10, 1865.
45, 904	Belbin, William.	Baltimore, Md.	Oyster dredges.	Jan. 17, 1865.
46, 628	Belchumbers, A.	Ripley, Ohio.	Harvesting machines.	Mar. 7, 1865.

Belcher, B. B. (See Gale, Warren, assignor.)	Reissue.	Philadelphia, Pa.	Steam generators, water gauge for.	Aug. 15, 1865.
Belcher, B. B. (See Gale, Warren, assignor.)	Reissue.	Pawnee City, N. T.	Evaporator.	Dec. 26, 1865.
Bel, J. C.		Bellport, N. Y.	Vessels, sunken, mode of raising.	Feb. 14, 1865.
Bell, Thomas.		Boston, Mass.	Meat cutter.	Jan. 3, 1865.
Bell, William G., assignor to William G. Bell & Co.		Boston, Mass.	Collars, paper, folding.	Feb. 7, 1865.
Bell, William S., assignor to self and William S. Bell, jr.		Boston, Mass.	Collars, paper.	June 13, 1865.
Bell, W. S., jr., and Chas. Spofford. (See Spofford & Bell.)				
Bellamy, C. L. (See Secor, Oliver P., assignor.)				
Bellows, W. S., et al. (See Field, L. C., assignor.)				
Belsor, James H., assignor to self and Sydney G. Fay.		Marlboro', Mass.	Boots and shoes, machines for shaving heels of.	Nov. 28, 1865.
Bemis, William A.		Lyndon Centre, Vt.	Pumps.	Jan. 31, 1865.
Bench, George and William.		Auburn, N. Y.	Wagon brake.	Dec. 26, 1865.
Benedict and Burham, manufacturing company. (See Croft, Edward, assignor.)				
Benedict, Philander H.		Syracuse, N. Y.	Buttons.	Mar. 14, 1865.
Bener, B. H., and M. H. Burgess.		Erie, Pa.	Candy, medicated.	July 11, 1865.
Benner, L. D., and W. R. Evans. (See Evans & Benner.)				
Bennett, Anthony A.		Norwalk, Conn.	Carding engines, waste-saving attachment to.	Apr. 18, 1865.
Bennett, Charles F., assignor to Maria Bennett.		Philadelphia, Pa.	Cloth drying machines.	Sept. 12, 1865.
Bennett, Edwin. (See Gillinder, William T., assignor.)				
Bennett, Edwin, assignor to self and W. T. Gillinder.		Philadelphia, Pa.	Furnace, annealing.	July 11, 1865.
Bennett, Jacob B., and James S. Gibbs.		Buffalo, N. Y.	Soap, manufacture of.	Apr. 25, 1865.
Bennett, J. R., and P. W. Breck.		Brooklyn, N. Y.	Table and bedstead combined.	Sept. 5, 1865.
Bennett, Noah.		Sherman, N. Y.	Apples, machine for coring, slicing, and stringing.	June 13, 1865.
Bennett, Oliver. (See Bassett & Smith, assignors.)				
Bennett, Oliver. (See Bassett, John A., assignor.)				
Bennett, Silas.		New Castle, Pa.	Heat from a furnace, apparatus for utilizing.	Oct. 24, 1865.
Bennett, William H.		Utica, N. Y.	Barrel heads, cutters for.	Oct. 31, 1865.
Bennet, Charles Pettit.		Detroit, Mich.	Tool holder, adjustable.	Feb. 21, 1865.
Benrains, Joseph. (See Henry, Levi J., assignor.)				
Benson, D. P., et al. (See Oliver, William G., assignor.)				
Bent, Samuel S.		New York, N. Y.	Register and summer piece, combined.	Jan. 3, 1865.
Bentley, Daniel, and Alexander W. Hall. (See Hall & Bentley.)				
Bentley, George J.		Michigan City, Ind.	Hoops, machine for riving.	Feb. 21, 1865.
Bentley, George W., assignor to self and Charles S. Hine.		New York, N. Y.	Boxes, blacking, manufacture of.	May 9, 1865.
Bentley, George W., assignor to self and Charles S. Hine.		New York, N. Y.	Boxes of sheet metal, machine for manufacturing.	May 23, 1865.
Benton, John B.		New York, N. Y.	Water meters. (Antedated March 12, 1865)	Mar. 28, 1865.
Benze, J., et al. (See Dwyer, Charles F., assignor.)				
Bequet, J. G., and A. A. Foubert. (See Foubert & Bequet.)				
Berdan, Hiram.		New York, N. Y.	Gun wipers.	Sept. 12, 1865.
Berdan, Hiram, assignor to L. P. Morton, trustee of H. Berdan,		New York, N. Y.	Fire-arms, breech-loading, rifling.	Jan. 10, 1865.
A. A. Selover, and William B. Benson.				
Berdan, Hiram, assignor to L. P. Morton, trustee of H. Berdan,		New York, N. Y.	Fire-arms, breech-loading.	Jan. 10, 1865.
A. A. Selover, and William B. Benson.				
Berdan, Hiram, assignor to L. P. Morton, trustee of H. Berdan,		New York, N. Y.	Fire-arms, attaching bayonets to.	Jan. 10, 1865.
A. A. Selover, and William B. Benson.				
Berdan, Hiram, assignor to L. P. Morton, trustee of H. Berdan,		New York, N. Y.	Cartridges for breech-loading rifled fire-arms.	Feb. 7, 1865.
A. A. Selover, and William B. Benson.				
Berg, Ezechiel.		New York, N. Y.	Sign.	Aug. 15, 1865.
			(Design)	

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
47,787	Bergman, Henry, and R. Borchardt. (See Borchardt & Bergman.)	Union Hill, N. J.	Burner gas.	May 23, 1865.
46,630	Berg, Hermann.	Galesburg, Ill.	Planters, corn.	Mar. 7, 1865.
49,631	Bergen, George I.	Galesburg, Ill.	Planters, corn.	Aug. 29, 1865.
1,955	Bergen, George I.	Galesburg, Ill.	Planters, corn. (Reissue).	Apr. 18, 1865.
2,134	Berger, Henry.	New York, N. Y.	Lincoln, A., bast of. (Design).	Jan. 18, 1865.
46,066	Bergner, Theodore.	Philadelphia, Pa.	Photographs, instrument for cutting.	July 31, 1865.
46,440	Bergstetter, Edwin L.	Berrysburg, Pa.	Churns.	Feb. 21, 1865.
49,335	Berry, C. M., and Charles C. Sheldrake, assignors to selves and J. Brady.	Philadelphia, Pa.	Soda fountains, sirup stand for.	Aug. 8, 1865.
49,051	Bessemer, Henry.	England.	Iron and steel, manufacture of. (Patented in England March 15, 1856.)	July 25, 1865.
49,052	Bessemer, Henry.	England.	Iron and steel, manufacture of. (Patented in England May 31, 1856.)	July 25, 1865.
49,053	Bessemer, Henry.	England.	Iron and steel, manufacture of. (Patented in England January 24, 1857.)	July 25, 1865.
49,054	Bessemer, Henry.	England.	Iron and steel, process for manufacturing axles, &c., from. (Patented in England March 16, 1859.)	July 25, 1865.
49,055	Bessemer, Henry.	England.	Iron and steel, machines for the manufacture of. (Patented in England March 1, 1860.)	July 25, 1865.
51,397	Bessemer, Henry.	England.	Iron and steel, manufacture of. (Patented in England February 1, 1861.)	Dec. 5, 1865.
51,398	Bessemer, Henry.	England.	Iron and steel, manufacture of. (Patented in England January 8, 1862.)	Dec. 5, 1865.
51,399	Bessemer, Henry.	England.	Iron and steel, malleable, manufacture of. (Patented in England January 13, 1863.)	Dec. 5, 1865.
51,400	Bessemer, Henry.	England.	Iron and steel, malleable, manufacture of. (Patented in England January 13, 1863.)	Dec. 5, 1865.
51,401	Bessemer, Henry.	England.	Iron and steel, malleable, manufacture of. (Patented in England November 5, 1863.)	Dec. 5, 1865.
49,217	Best, Isidiah. (See Brewer & Winer, assignors.)	Schenectady, N. Y.	Water elevators.	Aug. 8, 1865.
45,809	Best, Jacob H.	Pittsburg, Pa.	Glass, manufacture of.	Jan. 10, 1865.
49,218	Betley, Albert.	Boston, Mass.	Fuel, preparing peat for.	Aug. 8, 1865.
51,004	Betley, Albert.	Boston, Mass.	Fuel, preparation of peat for.	Nov. 21, 1865.
49,069	Betts, Henry.	Norwalk, Conn.	Paper stock, manufacture of.	Aug. 1, 1865.
51,005	Betts, Lewis F.	St. Louis, Mo.	Lanterns.	Nov. 28, 1865.
47,612	Betzal, Charles W.	Philadelphia, Pa.	Trusses.	Nov. 28, 1865.
46,773	Bavun, John.	New York, N. Y.	Water pipes, from bending, apparatus for preventing.	May 9, 1865.
48,358	Bever, John T.	Bethel, Ill.	Cultivators.	Mar. 14, 1865.
51,286	Beyer, John.	Bethel, Ill.	Cultivators.	June 27, 1865.
48,615	Beyer, Jacob, assignor to self and John E. Smith.	Buffalo, N. Y.	Wells, mode of extracting drills from.	Dec. 5, 1865.
50,871	Byrse, I. O., assignor to self and J. Utsey.	St. Louis, Mo.	Photographic prints, process for coloring.	Nov. 7, 1865.

47, 737	Chase, P. G.	Raymuntown, N. Y.	Wool, fleeces of, machine for putting up	Oct. 17, 1865.
50, 450	Chase, Samuel G.			

List of patents of inventions, designs, and reissues, 1865—(Continued.)

No.	Patentee.	Residence.	Invention or discovery.	Date.
51, 019	Chase, Theodore L.	Philadelphia, Pa.	Press, portable.	Nov. 21, 1865.
51, 536	Chase, William K.	Charlestown, Mass.	Clocks, calendar.	Dec. 13, 1865.
49, 075	Chatterton, George. (See Mayor, Thomas, assignor.) Chatterton, George. (See Mayor, Thomas, assignor.) Chavanne, André.	France.	Mail bags to and from railroad trains and stations, apparatus for receiving and delivering.	July 25, 1865.
51, 557	Chesbrough, Robert. (See Warren, J. T., assignor.)	New York, N. Y.	Petroleum by filtration, refining.	Dec. 19, 1865.
51, 558	Chesbrough, Robert A.	New York, N. Y.	Petroleum by filtration, refining.	Dec. 19, 1865.
48, 367	Chesbrough, Robert A.	New York, N. Y.	Petroleum, process for distilling.	June 27, 1865.
49, 250	Chesbrough, Robert A.	New York, N. Y.	Filtrating petroleum, apparatus for.	Aug. 8, 1865.
49, 502	Chesbrough, Robert A.	New York, N. Y.	Process for purifying coal-oil, &c.	Aug. 22, 1865.
46, 077	Chesbrough, Robert A. (See Warren, J. T., assignor.)	Cincinnati, Ohio.	Cocks, valve.	Jan. 31, 1865.
50, 219	Chesley, William	Cincinnati, Ohio.	Valves, globe.	Oct. 3, 1865.
2, 025	Chesney, S. M., and J. C. Brown, assignors through mesne assignors to J. Washburn and P. L. Moon.	Worcester, Mass.	Skirt wire, apparatus for sizing and finishing. (Reissue.)	July 4, 1865.
46, 657	Chesney, W. B.	Arlington, Ill.	Plaster, corn.	Mar. 7, 1865.
47, 416	Chesnut, Samuel, assignor to self and Thoma Jones.	Philadelphia, Pa.	Spind-steps, cutting and punching.	Oct. 10, 1865.
51, 144	Chester, Charles T.	Hickensack Township, N. J.	Batteries, carbon, connectors for.	Nov. 29, 1865.
48, 368	Chesterton, Edwin	Roxbury, Mass.	Boots and shoes.	June 27, 1865.
49, 065	Chevallier, Charles	Brooklyn, N. Y.	Ball, door.	Aug. 1, 1865.
46, 777	Cheney, Wadron J., and E. T. Dietrichs	Wallingford, Pa.	Coal dock, pond, &c., method of consolidating.	Mar. 14, 1865.
47, 596	Chichester, Lewis S., assignor to self and Clark W. Mills	Philadelphia, Pa.	Dryer, grain. (Antedated April 15, 1865.)	May 2, 1865.
49, 470	Chichester, Lewis S., assignor to self and Clark W. Mills	Brooklyn, N. Y.	Dryer, grain. (Antedated April 15, 1865.)	Aug. 15, 1865.
45, 908	Chickering, Jacob. (See Bean, Edwin E., assignor.)	Brooklyn, N. Y.	Gas or oilier rotors. (Antedated January 6, 1865.)	Jan. 17, 1865.
47, 323	Chilcatt, John.	Brooklyn, N. Y.	Extracts from vegetables, &c., apparatus for obtaining. (Antedated April 30, 1865.)	Apr. 25, 1865.
47, 324	Chilcatt, John.	Brooklyn, N. Y.	Distilling, process for preparing grain for. (Antedated April 15, 1865.)	Apr. 25, 1865.
47, 930	Chilcatt, John.	Brooklyn, N. Y.	Root and shoe soles. (Antedated May 19, 1865.)	May 30, 1865.
47, 931	Chilcatt, John.	Brooklyn, N. Y.	Mach. tool. (Antedated May 16, 1865.)	May 30, 1865.
48, 518	Chilcatt, John.	Brooklyn, N. Y.	Steam generators, cast-iron. (Antedated June 21, 1865.)	July 4, 1865.
49, 251	Chilcatt, John.	Brooklyn, N. Y.	Gas rotors, made of constraining the heads, necks, and connections of. (Antedated July 24, 1865.)	Aug. 8, 1865.
49, 523	Chilcatt, John.	Brooklyn, N. Y.	Oven for cooking. (Antedated August 11, 1865.)	Aug. 22, 1865.
49, 504	Chilcatt, John.	Brooklyn, N. Y.	Heaters. (Antedated August 15, 1865.)	Aug. 22, 1865.
50, 220	Chilcatt, John.	Brooklyn, N. Y.	Lathing, lath, method of revivifying. (Antedated September 23, 1865.)	Oct. 3, 1865.

50, 521	Chilcott, John.....	Brooklyn, N. Y.....	Boilers, steam, setting. (Antedated September 18, 1865)	Oct. 3, 1865.
50, 451	Chilcott, John.....	Brooklyn, N. Y.....	Sewing machines. (Antedated October 4, 1865)	Oct. 17, 1865.
2, 000	Chilcott, John.....	Brooklyn, N. Y.....	Gas and other retorts. (Reissue)	June 20, 1865.
2, 150	Childs, A. B. (See Leggett & Gittus, assignors.)	Boston, Mass.....	Stove..... (Design)	Aug. 1, 1865.
51, 424	Childs, E. L. (See Thompson, M. L., assignor.)	Roseton, Mass.....	Stove, coal.....	Dec. 12, 1865.
50, 452	Child, J. C., et al. (See Cochran, William F., assignor.)	Brooklyn, N. Y.....	Dancer, automatic. (Antedated October 4, 1865)	Oct. 17, 1865.
46, 880	Childson, Gardner.....	New York, N. Y.....	Churns.....	Mar. 21, 1865.
47, 798	Chinnock, Charles, and Henry Pennie. (See Pennie & Chinnock.)	Bergen county, N. J.....	Ticket for railroads, &c., identifying.....	May 23, 1865.
45, 977	Chitenden, August S.....	Washington, D. C.....	Buttons, handles for knives and for other purposes, material for the manufacture of.....	Jan. 24, 1865.
50, 333	Chitenden, Lucius E.....	Danbury, Conn.....	Brick, machine for pressing. (Antedated September 25, 1865)	Oct. 10, 1865.
50, 417	Choate, William, assignor to self, William Teel, J. Whitmore, and O. W. Clark.	Newburyport, Mass.....	Paddle wheel.....	Oct. 10, 1865.
48, 791	Chollat, Pierre E., and Antoine Choplain. (See Choplain & Chollat.)	Washington, D. C.....	Beer and other liquids, cooler for.....	July 18, 1865.
51, 559	Choplain, Antoine, and Pierre E. Chollat.....	New York, N. Y.....	Pianos, stringing.....	Dec. 19, 1865.
2, 235	Christensen, William.....	New York, N. Y.....	Group of statues, masonic..... (Design)	Dec. 26, 1865.
50, 095	Christian, Hibbard.....	New York, N. Y.....	Curling irons.....	Sept. 26, 1865.
51, 145	Christman, John.....	Syracuse, N. Y.....	Pump filters.....	Nov. 26, 1865.
49, 948	Christy, James, assignor to self, R. Dirks, and E. H. Zitzman.	Philadelphia, Pa.....	Brake shoe.....	Sept. 12, 1865.
51, 620	Crysler, Warren.....	Lockport, N. Y.....	Jars, fruit, stoppers for.....	Nov. 21, 1865.
49, 232	Chubb, Thomas J.....	Brooklyn, N. Y.....	Amalgamator.....	Aug. 8, 1865.
49, 377	Church, A., et al. (See Bidwell, J. A., assignor.)	Warham, Mass.....	Weighing apparatus.....	Aug. 15, 1865.
49, 377	Church, Wm. (See Riggs, Homer, assignor.)	Idaho, Ill.....	Cultivators.....	Oct. 17, 1865.
50, 453	Churchill, Benjamin.....	Pitts-on, Pa.....	Traps animal.....	Aug. 15, 1865.
49, 378	Churchill, Daniel, and S. C. Brewer.....	Moriden, Conn.....	Drawer pull..... (Design)	Nov. 7, 1865.
2, 216	Churchill, J. W.....	Rochester, N. Y.....	Watch main springs, implement for contracting the barrels of.....	Sept. 19, 1865.
49, 978	Cisco, L. D., and Geo. W. Heald. (See Heald and Cisco.)	Cleveland, Ohio.....	Timbers, mode of splitting.....	Apr. 25, 1865.
47, 295	Cladner, Andrew S.....	Auburn, N. Y.....	Thills, coupling for.....	May 2, 1865.
47, 520	Clapp, E. D.....	New York, N. Y.....	Pumps.....	Mar. 7, 1865.
46, 638	Clapp, M. R.....	Todd's Valley, Cal.....	Pipe for mining, flexible.....	Feb. 7, 1865.
46, 295	Clark, Anthony, assignor to self and Gorham Blake.	Delaware, Wis.....	Washing machine.....	Oct. 17, 1865.
50, 454	Clark, Arnold B.....	Austerman, N. Y.....	Coffin handles.....	Dec. 26, 1865.
51, 093	Clark, Augustus.....	New York, N. Y.....	Oil cans.....	Sept. 19, 1865.
49, 979	Clark, Benjamin.....	Winnington, Del.....	Press, parallel or other.....	Dec. 26, 1865.
51, 694	Clark, Charles H.....	Ruffalo, N. Y.....	Melodeons, mode of operating the swell of.....	Dec. 26, 1865.
46, 225	Clark, Daniel, and Thomas Stephenson.....	Pawtucket, R. I.....	Coffin studs..... (Design)	June 27, 1865.
2, 193	Clark, Daniel A.....	Hazleton, Pa.....	Piston packing.....	Aug. 15, 1865.
43, 379	Clark, David.....	Auburn, Mass.....	Fire-arms, breech-loading.....	Jan. 3, 1865.
47, 701	Clark, E. H., et al. (See Hudson, Alonzo R., assignor.)	Racine, Wis.....	Car coupling.....	Dec. 26, 1865.
45, 701	Clark, E. W., et al. (See Higley, Peter R., assignor.)			
51, 695	Clark, Francis.....			
	Clark, G. E.....			
	Clark, Geo. H., and John T. (See Beuch, E. B., assignor.)			

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
47, 521	Clark, Geo. P.	Brooklyn, N. Y.	Boots and shoes.	May 2, 1865.
46, 543	Clark, Henry A. (See Griswold, Henry J., assignor.)	Plattsville, Conn.	Taps, apparatus for making.	Feb. 28, 1865.
46, 639	Clark, James B.	New York, N. Y.	Telegraphs, receiving magnets for.	Mar. 7, 1865.
47, 857	Clark, James J., and Henry Splittorf.	New York, N. Y.	Magnets, sounder.	Sept. 12, 1865.
46, 881	Clark, J. K. and C. B.	Mount Pleasant, Iowa.	Fence.	Mar. 21, 1865.
51, 146	Clark, James K., and Charles A. Shaw. (See Shaw & Clark.)	Baltimore, Md.	Suspender pockets.	Nov. 28, 1865.
47, 739	Clark, John F.	Dayton, Ohio.	Broom.	May 23, 1865.
49, 380	Clark, John M.	United States army.	Water wheels.	Aug. 15, 1865.
50, 756	Clark, John W.	Manchester, Wis.	Car axle.	Nov. 7, 1865.
51, 696	Clark, Joseph H.	Westbrook, Maine.	Cars, railway, saving-jack for.	Dec. 26, 1865.
49, 720	Clark, Morrell.	Castalia, Iowa.	Seeding machines.	Sept. 5, 1865.
46, 640	Clark, Moses M.	Monroe, N. Y.	Mf k. case for preserving and transporting.	Mar. 7, 1865.
46, 641	Clark, N. D.	Detroit, Mich.	Gold washer. (Antedated March 3, 1865).	Mar. 7, 1865.
49, 604	Clark, Nelson W.	Detroit, Mich.	Building for preserving milk, fruit, &c.	Aug. 29, 1865.
50, 096	Clarke, O. W., et al. (See Choute, William, assignor.)	Philadelphia, Pa.	Skate.	Sept. 26, 1865.
49, 858	Clarke, Solah H.	Cohoes, N. Y.	Engines, steam, valves for.	Sept. 12, 1865.
47, 619	Clark, Thomas H.	St. Louis, Mo.	Furnaces, boiler.	July 3, 1865.
48, 617	Clark, Wm. C., assignor to self, W. D. Richard, and W. H. Skalnec.	Portland, Maine.	Car coupling.	July 4, 1865.
49, 605	Clark, Wm. H.	Cincinnati, Ohio.	Tent frames.	Aug. 29, 1865.
1, 916	Clark, Wm. H. (See Maltby & Osborn, assignors.)	Southington, Conn.	Bells, carriage, dies for.	Mar. 28, 1865.
1, 917	Clark, Wm. J.	Southington, Conn.	Belts.	Mar. 28, 1865.
51, 783	Clark, Wm. S., and John Keats. (See Keats & Clark.)	Philadelphia, Pa.	Hog scald, portable.	Dec. 26, 1865.
46, 418	Clarke, Chas. M., and B. W. Robinson. (See Hall, A. W., assignor.)	New Haven, Conn.	Pasteboard, machine for cutting.	Feb. 21, 1865.
46, 532	Clarke, Elizar E., assignor to Franklin N. Clarke.	New Haven, Conn.	Pasteboard for boxes, machine for cutting.	Feb. 21, 1865.
46, 604	Clarke, Elizar E., assignor to Franklin N. Clarke.	New Haven, Conn.	Prices, construction of. (Antedated October 13, 1865).	Feb. 28, 1865.
50, 654	Clarke, Elizar E., assignor to Franklin N. Clarke.	New Haven, Conn.	Prices, construction of. (Antedated October 13, 1865).	Oct. 24, 1865.
47, 280	Clarke, Geo. B.	Leonardsville, N. Y.	Spittoon and foot warmer, combined.	Apr. 18, 1865.
51, 777	Clarke, G. F., assignor to self and Sylvester Bullen.	Racine, Wis.	Traps, animal.	Dec. 26, 1865.
46, 078	Clarke, James A.	New York, N. Y.	Wool, machine for washing.	Jan. 31, 1865.
2, 080	Clarke, James G., assignor to S. H. Burton & Co.	Cincinnati, Ohio.	Stove, cooks.	June 6, 1865.
48, 773	Clarke, James G., assignor to S. H. Burton & Co.	Cincinnati, Ohio.	Grate for cooking stove.	July 11, 1865.
48, 053	Clarke, Thomas W.	Manchester, N. H.	Printing machines, washing the blankets of.	June 6, 1865.
49, 606	Clarke, William M.	Butternuts, Ind.	Leather, machine for scouring.	Aug. 29, 1865.
46, 778	Clary, David A.	Pittsfield, Mass.	Governors.	Mar. 14, 1865.
50, 686	Clary, John, and Elijah B. Torrey.	Ithaca, N. Y.	Wells, artesian, filter for.	Oct. 31, 1865.
49, 950	Clay, C. M. (See Broadwell, Lewis Wells, assignor.)	Philadelphia, Pa.	Knitting machines.	Sept. 19, 1865.
	Clay, Cassius M. (See Stoppel, John, assignor.)			
	Clay, William W.			

47, 522	Clayton, James.	Brooklyn, N. Y.	Crank wrist connections.	May 2, 1865.
48, 657	Clayton, William and Lewis Clegg, C. A., et al. (See Silvers, Aaron, assignor.)	Philadelphia, Pa.	Mills, cider	July 11, 1865.
45, 702	Clegg, Thomas. (See Pettie & Taylor, assignors.)			
49, 721	Clemens, Gilbert H.	United States army	Saw-mills	Jan. 3, 1865.
50, 455	Clemens, Gilbert H.	Cincinnati, Ohio.	Saw-mills	Sept. 5, 1865.
50, 334	Clemens, Nathan S.	New York, N. Y.	Fire-arm, breech-loading (Antedated April 29, 1865)	Oct. 17, 1865.
46, 047	Clement, Daniel B., assignor to self and Duane H. Nash.	Brooklyn, N. Y.	Hay forks, horse.	Jan. 24, 1865.
51, 560	Clement, John C.	Kenduskeag, Me.	Planting, hoeing, and digging potatoes, combined machine for.	Dec. 19, 1865.
47, 281	Clement, Richard C.	Philadelphia, Pa.	Legs, artificial.	Apr. 18, 1865.
46, 079	Clemmatts, Charles C. (See Tomlinson, Abraham, assignor.)	Troy, N. Y.	Filters	Jan. 31, 1865.
50, 335	Clemmshaw, Charles	Philadelphia, Pa.	Aniline red, manufacture of.	Oct. 10, 1865.
48, 369	Clemm, Charles, and Clemm, August.	Baden, Pa.	Sewing machines, et th guide for.	June 27, 1865.
46, 060	Clemmons, George F.	Springfield, Mass.	Ordinance, submarine, valve for	Jan. 31, 1865.
	Cleu, John F.	New York, N. Y.		
	Cleveland, E. S., and J. H. Pattee. (See Pattee & Cleveland.)			
	Cleveland, Samuel E., and Thomas S. Ray. (See Ray & Cleveland.)			
	Cleveland, Samuel E., and Thomas S. Ray. (See Ray & Cleveland.)			
46, 336	Clifton, John C. (See Nimbs, A. B., assignor.)	B'oming Grove, N. Y.	Car coupling	Feb. 14, 1865.
50, 687	Clippinger, Josiah A.	Newton, Iowa.	Movement, unchemical	Oct. 31, 1865.
51, 425	Clock, D. H., and F. D. Ryan.	Newville, Ind.	Trace fastener	Dec. 12, 1865.
49, 981	Close, Jeremiah	Brooklyn, N. Y.	Planing machines	Sept. 19, 1865.
49, 982	Close, Jeremiah, and Ira Buckman, jr.	Brooklyn, N. Y.	Hinges	Sept. 19, 1865.
51, 426	Close, Jeremiah, and Ira Buckman, jr.	Brooklyn, N. Y.	Hinges	Dec. 12, 1865.
47, 523	Close, W. R.	Bangor, Me.	Yoke, ox.	May 2, 1865.
47, 597	Close, W. R., assignor to self and G. W. Merrill.	Bangor, Me.	Saws, circular, hanging	May 2, 1865.
	Cloude, Alfred and Hiram Richmond. (See Richmond & Cloude.)			
51, 607	Clough, Samuel G.	Waupun, Wis.	Wagons, rubber springs for	Dec. 26, 1865.
46, 492	Clum, Henry A.	Rochester, N. Y.	Balances	Mar. 28, 1865.
47, 650	Cobb, John.	Coles, N. Y.	Knitting machine burs	May 9, 1865.
51, 294	Cobb, Russell.	Hadley, Mich.	Hay, means for leading	Dec. 5, 1865.
50, 456	Coburn, H. R.	Lowell, Mass.	Odometers	Oct. 17, 1865.

48, 069	Ingersoll, Joseph.	Milton, Ind.	Drills, grain	June 6, 1865.
50, 713	Ingersoll, Platt C.	Greenpoint, N. Y.	Bed bottom	Oct. 31, 1865.
46, 051	Ingersoll, P. S., assignor to self and Horace F. Dougherty.	Greenpoint, N. Y.	Presses	Jan. 24, 1865.
49, 032	Ingersoll, Simon, assignor to self and George H. Keith.	Stamford, Conn.	Ore crushers	July 25, 1865.
46, 675	Ingham, A., et al. (See Brown, Ingham & Lomont.)	Livingston, Ill.	Cultivators	Mar. 7, 1865.
49, 111	Ingle, John W., and R. H. Wright	Naples, N. Y.	Cultivators	Aug. 1, 1865.
51, 055	Ingraham, Hanford.	Naples, N. Y.	Cultivators	Nov. 21, 1865.
49, 411	Ingraham, James	New York, N. Y.	Shutter cases.	Aug. 15, 1865.
49, 033	Ingram, James D., assignor to G. M. Rice, G. S. Barton, and J. E. Fales	New York, N. Y.	Steam-pressure gauges.	July 25, 1865.
49, 525	Ingram, S. D.	Harrisburg, Pa.	Reflector, adjustable fastening for a	Aug. 22, 1865.
51, 457	Innis, James W.	Milroy, Ind.	Thill coupling	Dec. 12, 1865.
50, 204	Innis, William J., assignor to A. Burgess & Co.	Providence, R. I.	Spinning machines, machines for making paper cop tubes for	Sept. 26, 1865.
50, 007	Iron, Andrew	Femme Osage, Mo.	Stirrups, saddle	Sept. 19, 1865.
46, 363	Irvine, John H.	Chicago, Ill.	Lamps and lanterns, burners for	Feb. 14, 1865.
47, 256	Irvine, John H.	Chicago, Ill.	Air, apparatus for carburetting	Apr. 11, 1865.
47, 257	Irvine, John H.	Chicago, Ill.	Air, apparatus for carburetting	Apr. 11, 1865.
47, 551	Irvine, John H.	Chicago, Ill.	Lanterns	May 2, 1865.
49, 526	Irvine, John H.	Chicago, Ill.	Air, apparatus for carburetting	Aug. 22, 1865.
50, 250	Irvine, John H.	Chicago, Ill.	Air, apparatus for carburetting	Oct. 3, 1865.
50, 251	Irvine, John H.	Chicago, Ill.	Air, apparatus for carburetting	Oct. 3, 1865.
50, 591	Irvine, John H.	Chicago, Ill.	Lanterns	Oct. 24, 1865.
1, 850	Irvine, John H., assignor to self and James F. Griffin.	Chicago, Ill.	Lanterns	Jan. 10, 1865.
47, 253	Irvine, John H., and Isaac Simmons	Chicago, Ill.	Air, apparatus for carburetting	Apr. 11, 1865.
46, 800	Ibrell, Charles W.	New York, N. Y.	Engines, steam	Mar. 14, 1865.
	Ibrell, R. H. (See Valentine, John G., assignor.)			

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
47, 020	Iseminger, D. H.	Heyworth, Ill.	Sorghum evaporator	Mar. 29, 1865.
51, 056	Idham, Henry	New Britain, Conn.	Water meters	Nov. 21, 1865.
49, 112	Idham, H. L.	Plattsburg, N. Y.	Wagons, light	Aug. 1, 1865.
46, 240	Iake, Anthony	Lancaster, Pa.	Table, extension	Feb. 7, 1865.
49, 412	Iake, Anthony	Lancaster, Pa.	Bedstead, hospital	Aug. 15, 1865.
46, 801	Ivers, Alfred	New York, N. Y.	Globes for flasks	Mar. 14, 1865.
46, 471	Iversen, Hans, et al. (See Postensen, Iversen & Skow.)	Mont Carmel, Conn.	Lamps	Feb. 21, 1865.
48, 816	Ives, James	Mont Carmel, Conn.	Lamps	July 18, 1865.
49, 274	Ives, James	Mont Carmel, Conn.	Lanterns	Aug. 8, 1865.
49, 630	Ives, James	Mont Carmel, Conn.	Cattle tie	Aug. 29, 1865.
49, 413	Ives, James O.	St. Louis, Mo.	Digger, potato	Aug. 15, 1865.
48, 070	Ives, John G.	Springfield, Ill.	Valves, slide	June 16, 1865.
47, 357	Jackson, John, jr., assignor to the American Stop-motion Co.	Newburyport, Mass.	Engines, steam, automatic stop-motion for	June 18, 1865.
47, 358	Jackson, John, jr., assignor to the American Stop-motion Co.	Newburyport, Mass.	Engines, steam, automatic stop-motion for	Apr. 18, 1865.
47, 359	Jackson, John, jr., assignor to the American Stop-motion Co.	Newburyport, Mass.	Engines, steam, automatic stop-motion for	Apr. 18, 1865.
51, 189	Jackson, Andrew P., and Leander Thompson	Memphis, Ind.	Drilling machine	Nov. 28, 1865.
46, 109	Jackson, Benjamin	Trenton, N. J.	Pottery ware, safeguard for protecting	Jan. 31, 1865.
50, 592	Jackson, Charles, and J. G. Pusey	Providence, R. I.	Cartridges, metallic, priming	Oct. 24, 1865.
49, 759	Jackson, Charles H.	Angola, N. Y.	Wells, deep, piston packing for	Sept. 5, 1865.
51, 037	Jackson, Charles H.	St. Louis, Mo.	Clothes dryer	Nov. 21, 1865.
49, 113	Jackson, H.	New York, N. Y.	Clothes dryer	Aug. 1, 1865.
46, 241	Jackson, Henry	Brooklyn, N. Y.	Padlocks	Feb. 7, 1865.
47, 422	Jackson, Henry	Brooklyn, N. Y.	Locks	Feb. 7, 1865.
51, 458	Jackson, Henry. (See Ott, W. Adolph, assignor.)	Woonsocket, R. I.	Stair-rod fastening	Apr. 25, 1865.
48, 282	Jackson, James	New York, N. Y.	Woolgear, machines for cutting	Dec. 12, 1865.
46, 110	Jackson, Peter H., and Samuel Eddy	New York, N. Y.	Windlases	June 20, 1865.
49, 275	Jackson, Pickmore	Brooklyn, N. Y.	Windlases	Jan. 31, 1865.
50, 360	Jackson, Pickmore	Saugus, Mass.	Laets	Aug. 8, 1865.
45, 850	Jackson, Samuel	Saugus, Mass.	Boot and shoe uppers, machine for cutting	Oct. 10, 1865.
50, 130	Jackson, Silas T.	Philadelphia, Pa.	Cartridges. (Antedated January 3, 1865.)	Jan. 10, 1865.
50, 583	Jackson, Silas T.	Sheboygan Falls, Wis.	Wagon wheels, machines for dressing	Sept. 26, 1865.
50, 131	Jackson, Thomas B. (See Webber, Nathaniel B., assignor.)	Sheboygan Falls, Wis.	Chuck, self-centring	Oct. 24, 1865.
46, 004	Jackson, William, and Frank Robinson	New York, N. Y.	Washing machine	Sept. 26, 1865.
50, 714	Jacob, Fritz	New York, N. Y.	Propeller, screw	Jan. 24, 1865.
	Jacob, Fritz	New York, N. Y.	Propeller	Oct. 31, 1865.
	Jacobs, Lionel. (See Hicks, Alonzo, assignor.)			
	Jacobs, M. G. and F. H. (See Brown, William, assignor.)			
	Jacques, Henry H. (See Boyden, Seth, assignor.)			
1, 902	Jagger, William G. W.	Baltimore, Md.	Oils and gases, condensing and separating	Mar. 14, 1865.
49, 881	James, Christopher R.	Jersey City, N. J.	Woolgear, machines for cutting	Sept. 12, 1865.
51, 058	James, F. H., and N. B. Gatchell	Lancaster, N. Y.	Pontil clamping. (Antedated November 8, 1865.)	Nov. 21, 1865.

1, 954	James, Ira	Mattoon, Ill.	Presses, hay and cotton	(Reissue)	May 9, 1865.
47, 423	James, William H.	Cincinnati, Ohio	Fireplace		Apr. 25, 1865.
48, 034	Jamet, Pierre Joseph	France	Tackle, safety		May 30, 1865.
49, 114	Jamison, Andrew	Taylorstown, Pa.	Water wheels		Aug. 1, 1865.
46, 566	Jaun, John	New Windsor, Md.	Mowing machines		Feb. 28, 1865.
46, 802	Jacques, David L.	Hudson, Mich.	Lantern, stove		Mar. 14, 1865.
1, 939	Jacques, Thomas T., assignor to Benjamin F. Hiest.	Greenville, N. Y.	Hay-elevating forks	(Reissue)	Jan. 13, 1865.
47, 831	Jarvis, Charles	Ellsworth, Me.	Cultivator and weeder, root		Apr. 18, 1865.
47, 308	Jasper, Gustavus A.	Charlestown, Mass.	Charcoal, cleansing and purifying		Oct. 24, 1865.
50, 594	Jauriet, Charles F.	Aurora, Ill.	Car trucks		Apr. 18, 1865.
47, 371	Jay, James M., assignor to William H. Alexander & Co.	Canton, Ohio	Rakes, horse		Apr. 18, 1865.
47, 769	Jay, James M., assignor to William H. Alexander & Co.	Canton, Ohio	Wagon axes, machines for making the spindles of		May 16, 1865.
48, 869	Jeffery, Edwin A., assignor to American Basket Company	New Haven, Conn.	Baskets, machines for forming		July 18, 1865.
49, 590	Jeffery, Edwin A., assignor to American Basket Company	New Haven, Conn.	Fruit baskets		Aug. 1, 1865.
50, 361	Jeffrey, Henry	Vincennes, Ind.	Claw-bar		Oct. 10, 1865.
49, 115	Jelliffe, Charles E. S.	Williamsburg, N. Y.	Blacking-box holder		Aug. 1, 1865.
50, 074	Jellison, John H., assignor to C. & J. R. Pierce.	Milford, Mass.	Crimping forms, machine for shaping		Sept. 19, 1865.
50, 362	Jenkins, B. R., and C. Sumner. (See Millet, John W., assignor.)	Brooklyn, N. Y.	Bars, railroad, moulds for casting.		Oct. 10, 1865.
	Jenkins, Henry	Brooklyn, N. Y.	Fence, iron, ornamental connection of the parts of an. (Dis-claimer.)		Dec. 29, 1865.
	Jenkins, Henry	Brooklyn, N. Y.	Funerets		Apr. 18, 1865.
47, 309	Jenkins, Nathaniel	Boston, Mass.	Cocks, self-closing		June 27, 1865.
48, 407	Jenkins, Nathaniel	Boston, Mass.	Cocks, valve		Aug. 1, 1865.
49, 116	Jenkins, Nathaniel	Boston, Mass.	Faucets		Aug. 22, 1865.
49, 527	Jenkins, Nathaniel	Boston, Mass.	Cocks	(Reissue)	June 6, 1865.
1, 979	Jenkins, Nathaniel	Boston, Mass.	Iron, process for hardening		Dec. 26, 1865.
51, 723	Jenkins, Thomas H.	New York, N. Y.	Cutlery, edge tools, &c., substance for making		Dec. 26, 1865.
51, 724	Jenkins, Thomas H.	New York, N. Y.			
	Jenks, Barton H. (See Lutvan, Isaac, assignor.)				
	Jenks, George. (See Aldrich, Hosea P., assignor.)				
46, 472	Jenks, George. (See Aldrich, Hosea P., assignor.)				
46, 760	Jenks, Henry F.	Pawtucket, R. I.	Supporters, window-sash		Feb. 21, 1865.
	Jenks, Robert W.	Providence, R. I.	Match-safe		Sept. 5, 1865.
	Jenks, Stollman H., and Henry S. Babcock. (See Babcock & Jenks.)				
48, 217	Jenne, C. M.	Young America, Ill.	Cultivators		July 18, 1865.
46, 999	Jennings, George N.	Virginia City, Nevada	Gold and silver from mineral and earthy substances, process for separating.		Mar. 21, 1865.
47, 022	Jennings, G. W.	Boston, Mass.	Mowing machines, hand		Mar. 22, 1865.
49, 626	Jennings, H. D., assignor to Bernard Lavery	Ilion, N. Y.	Curling irons		July 4, 1865.
46, 473	Jennings, James	New York, N. Y.	Gas, illuminating, apparatus for the manufacture of		Feb. 21, 1865.
46, 676	Jennings, John, and George C. Sweet	West Meriden, Conn.	Screw plates		Mar. 7, 1865.
2, 081	Jennings, Russell	Deep River, Conn.	Augers	(Reissue)	Oct. 3, 1865.
2, 057	Jerome, S. B.	New Haven, Conn.	Clock case	(Design)	May 9, 1865.
47, 643	{ Jerome, Walter W., and Lewis K. Cole	Rochester, N. Y.	Canal gates, lock valves for		May 9, 1865.
50, 505	Jervis, James	Syracuse, N. Y.	File-cutting machines		Oct. 24, 1865.
2, 165	Jewell, Alvan L.	Baltimore, Md.	Wind vane	(Design)	Sept. 12, 1865.
48, 560	Jewell, John C.	Waltham, Mass.	Forging machine		July 4, 1865.
48, 949	Jewett, Edward S.	Lima, Mich.	Seeding machine, broadcast. (Antedated July 19, 1865)		July 25, 1865.
49, 528	Jewett, George B.	Salem, Mass.	Legs, artificial		Aug. 22, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
49, 529	Jewett, George B.	Salem, Mass.	Legs, artificial.	Aug. 22, 1865.
51, 593	Jewett, George B.	Salem, Mass.	Legs, artificial.	Dec. 26, 1865.
46, 242	Jillson, C.	Worcester, Mass.	Wire on the coil, machine for pointing	Feb. 7, 1865.
47, 954	Jillson, C.	Worcester, Mass.	Wire-pointing machine.	May 30, 1865.
47, 955	Jillson, C.	Worcester, Mass.	Wire, machine for pointing.	May 30, 1865.
48, 383	Jillson, C.	Worcester, Mass.	Wire-pointing machine.	June 30, 1865.
50, 478	Jillson, C.	Worcester, Mass.	Harrows.	Oct. 17, 1865.
47, 730	Jincks, Melvin.	Danville, N. Y.	Mon.	May 16, 1865.
2, 020	Jochum, John.	Brooklyn, N. Y.	Pulley brake.	July 4, 1865.
47, 956	Johanning, Lewis W., jr.	San Francisco, Cal.	Wire-cutting machine.	May 30, 1865.
2, 058	Johnson, Benjamin F., assignor to Wager & Falls.	Troy, N. Y.	Slove.	May 9, 1865.
49, 761	Johnson, Charles F., jr.	Owego, N. Y.	Ploughs, steam.	Sept. 5, 1865.
47, 460	Johnson, Charles H., assignor to self and Charles E. Woodman.	Boston, Mass.	Horseshoe and calks, detachable.	Apr. 18, 1865.
47, 495	Johnson, Charles H., assignor to self and Charles E. Woodman.	Boston, Mass.	Horseshoes and calks.	Apr. 25, 1865.
48, 340	Johnson, Charles H., assignor to self and Eugene Woodman.	Boston, Mass.	Burner, gas, Argand.	June 20, 1865.
50, 836	Johnson, Charles W.	Waterbury, Conn.	Presses, power.	Nov. 7, 1865.
49, 034	Johnson, Charles W., assignor to Hiram Dailey and S. Atwater.	Waterbury, Conn.	Drills, rock.	July 25, 1865.
47, 329	Johnson, Danforth.	Chicago, Ill.	Churn-dashers.	Apr. 11, 1865.
48, 950	Johnson, E., jr.	Cleveland, Ohio.	Skate.	July 25, 1865.
45, 832	Johnson, E. C., and S. P. Ochiltree. (See Ochiltree & Johnson.)	Brooklyn, N. Y.	Bed bottom.	Jan. 10, 1865.
51, 725	Johnson, Frank G.	Decorah, Iowa.	Planting, machine for marking corn ground for.	Dec. 26, 1865.
47, 424	Johnson, Geo., and Daniel Stanley. (See Stanley & Johnson.)	Pittsburg, Pa.	Engines, steam.	Apr. 25, 1865.
47, 310	Johnson, Henry.	Lodi Station, Ill.	Lightning conductors.	Apr. 18, 1865.
46, 677	Johnson, Isaac.	Ashburnham, Mass.	Lathe, engine.	Mar. 7, 1865.
49, 414	Johnson, James L., et al. (See Burrill, J., assignor.) Reissue.	New York, N. Y.	Valves, steam.	Aug. 15, 1865.
50, 132	Johnson, Job, and William Davis. (See Davis & Johnson.)	Saco, Maine.	Turpentine, spirits of, manufacture of.	Sept. 26, 1865.
50, 659	Johnson, John.	Saco, Maine.	Mirrors, foliet.	Oct. 24, 1865.
50, 936	Johnson, John, assignor to self and Howard Tilden.	Kalamazoo, Mich.	Tanning, process for.	Nov. 14, 1865.
51, 279	{ Johnson, John, jr., and Michael and E. J. Murray	Yonking, N. Y.	Photographic panoramic views, apparatus for taking. (Patented in England September 5, 1862.)	Nov. 28, 1865.
47, 731	Johnson, John R., and John A. Harrison.	New York, N. Y.	Jar, fruit.	May 16, 1865.
48, 071	Johnson, Josee.	New York, N. Y.	Washing machine.	June 6, 1865.
47, 152	Johnson, Josee, assignor to John Ward, jr.	New York, N. Y.	Mangle. (Antedated March 30, 1865).	Apr. 4, 1865.
46, 299	Johnson, Joseph E., assignor to self and Charles Buffum.	Lynn, Mass.	Shoes.	Feb. 7, 1865.
51, 726	Johnson, Moses A., and John H. Bloodgood. (See Bloodgood & Johnson.)	Ripon, Wis.	Pumps.	Dec. 25, 1865.
	Johnson, Step n, and Worden Edmister. (See Edmister & Johnson.)			

51, 727	Johnson, W	Topsham, Maine.	Desk, school.	Dec. 26, 1865.
49, 681	Johnson, Warren, assignor to self and Albert Thompson	Fisherville, N. H.	Tethering animals, device for	Aug. 29, 1865.
47, 732	Johnson, W. J.	Newton, Mass.	Sifter, flour	May 16, 1865.
51, 133	Johnson, William	Milwankie, Wis.	Dampers	Sept. 26, 1865.
50, 383	Johnson, William H	Norboro', Mass.	Rakes, horse	Oct. 10, 1865.
46, 951	Johnson, William W	Harrison, Maine	Scrapers, road	July 25, 1865.
			Ores of gold, silver, &c., mode of roasting, desulphurizing, and disintegrating.	June 20, 1865.
48, 384	Johnston, Algernon K.	New York, N. Y.	Oil, apparatus for distilling	June 20, 1865.
48, 385	Johnston, James J	Allegheny, Pa.	Evaporating liquids, apparatus for. (Antedated Nov. 2, 1865)	Nov. 14, 1865.
50, 935	Johnston, J. M. (See Cooper, Edward A., assignor.)	Allegheny, Pa.		
47, 208	Johnston, John	Alexandria, Va.	Railroads, straightening rails of	Apr. 11, 1865.
46, 190	Johnston, Samuel, assignor to self and Rufus L. Howard	Buffalo, N. Y.	Harvesters, combined rakes and reels for	Jan. 31, 1865.
46, 400	Johnston, Samuel, assignor to self and Rufus L. Howard	Buffalo, N. Y.	Engines, steam, slide valves for	Feb. 7, 1865.
51, 656	Jones, Abner W., assignor to N. D. Morgan	Brooklyn, N. Y.	Stamp, hand	Dec. 19, 1865.
50, 715	Jones, Charles, assignor to self and Charles Hodgott	Buffalo, N. Y.	Coal-hod, ash-sifter, and slop pail combined	Oct. 31, 1865.
48, 020	Jones, Charles, assignor to self and Charles Hodgott	Brooklyn, N. Y.	Funnel	May 30, 1865.
51, 515	Jones, Charles, and Emma W	Brooklyn, N. Y.	Fire-escape	Dec. 12, 1865.
50, 556	Jones, Charles T., et al. (See Groneweg, Putte & Jones.)	New Brighton, N. Y.		Oct. 24, 1865.
49, 117	Jones, David J.	Sadsbury, Pa.	Drills, grain	Aug. 1, 1865.
50, 302	Jones, Edward, assignor to self and E. J. Davenport	Roston, Mass.	Burner, gas, and stop-cock	Oct. 3, 1865.
42, 286	Jones, Edward H	West Albany, N. Y.	Grates, steam furnace.	June 20, 1865.
46, 391	Jones, Edwin. (See Tinker & Sprague, assignors.) Reissue.	N. W. York, N. Y.	Coffee roaster and grain dryer.	Feb. 7, 1865.
42, 403	Jones, Gilbert D., assignor to self and Charles Puce	Kensington, Conn.	Lathe for turning foot handles	June 27, 1865.
46, 791	Jones, Horace K., assignor to the Hart Manufacturing Company	Kensington, Conn.	Squares, carpenters', machine for indicating	Jan. 31, 1865.
49, 115	Jones, Isidiah T.	Sandwich, Mass.	Boots and shoes	Aug. 1, 1865.
47, 044	Jones, James D.	Pittsburg, Pa.	Rakes, horse	May 9, 1865.
43, 882	Jones, James D.	Pittsburg, Pa.	Drills, grain	Sept. 12, 1865.
49, 853	Jones, James D.	Pittsburg, Pa.	Drills, grain, adjustable drag-bar for	Sept. 12, 1865.
50, 134	Jones, James D.	Pittsburg, Pa.	Drills, grain	Sept. 26, 1865.
50, 135	Jones, James D.	Pittsburg, Pa.	Drills, grain, drag-bar and teeth for	Sept. 26, 1865.
51, 405	Jones, James Crafton	Wales	Coal mining incline	Dec. 5, 1865.
47, 925	Jones, John F.	Rochester, N. Y.	Paper and paper boards, machine for making	Mar. 7, 1865.
47, 125	Jones, John F.	Rochester, N. Y.	Paper pulp, machines for grinding	Apr. 25, 1865.
49, 179	Jones, John F.	Rochester, N. Y.	Paper board, machines for making	Aug. 1, 1865.
43, 854	Jones, John F.	Rochester, N. Y.	Paper board, machines for making	Sept. 12, 1865.
46, 863	Jones, J. H.	Ironton, Ohio	Railroad chairs	Mar. 14, 1865.
47, 426	Jones, J. H.	New York, N. Y.	Heater, gas	Apr. 25, 1865.
49, 550	Jones, J. Hervey	Rockton, Ill.	Harvester mikes	Aug. 25, 1865.
48, 410	Jones, John O.	Boston, Mass.	Carpet fastener	June 27, 1865.
48, 600	Jones, John S	Covington, Ind.	Reaping machines, binding attachments to	July 11, 1865.
49, 875	Jones, Joseph	West Albany, N. Y.	Car-brakes, railroad	Sept. 12, 1865.
50, 567	Jones, Joshua W.	Harrisburg, Pa.	Book-clamp. (Antedated April 27, 1865)	Oct. 24, 1865.
51, 980	Jones, O. B. (See Lockwood, R. G., assignor.)	England	Preserving animal and vegetable substances, method of	Nov. 28, 1865.
49, 072	Jones, Robert V.	Canton, Ohio	Meat crusher	June 6, 1865.
49, 762	Jones, Robert V.	Canton, Ohio	Meat cutter	Sept. 5, 1865.
49, 655	Jones, Robert V.	Canton, Ohio	Meat cutter	Aug. 25, 1865.
50, 576	Jones, Samuel F.	St. Paul, Minn.	Ditching machine	Aug. 8, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
49, 531	Jones, Samuel K.	New Haven, Conn.	Photographic printing frame	Aug. 22, 1865.
	Jones, Thomas. (See Chesant, Samuel, assignor.)			
2, 161	Jones, Thomas D.	Cincinnati, Ohio.	Lincoln, Abraham, bust of. (Design)	Aug. 8, 1865.
48, 870	Jones, Thomas J., assignor to self, G. Wottengall, and J. D. Richards.	West Pittsburgh, Pa.	Boilers, steam	July 18, 1865.
46, 005	Jones, Thomas W. (See Richards, Stephen M., assignor.)	Baltimore, Md.	Metallic filings, apparatus for separating	Jan. 24, 1865.
50, 435	Johnson, Julius.	Washington, D. C.	Mails on railroad cars, apparatus for receiving and delivering	Oct. 10, 1865.
45, 721	Jordan, Charles. (See Baker, F. M., assignor.)	Milford, Ohio.	Planters, corn.	Jan. 3, 1865.
51, 039	Jordan, Hiram.	Norfolk, Conn.	Fastener, window and door	Nov. 21, 1865.
50, 364	Jordan, Lucius, and Leander E. Smith.	Southington, Conn.	Wrench	Oct. 10, 1865.
	Jordan, W. H. S., and D. C. Hood. (See Wood, Charles A., assignor.)			
46, 243	Joselyn, Benjamin F.	Stonington, Conn.	Fire-arms, revolving	Feb. 7, 1865.
48, 073	Joselyn, Benjamin F.	Stonington, Conn.	Fire-arm, breech-loading	June 6, 1865.
48, 287	Joselyn, Benjamin F.	Stonington, Conn.	Fire-arms, revolving. (Antedated June 14, 1865)	June 30, 1865.
48, 298	Joselyn, Benjamin F.	Stonington, Conn.	Fire-arms, breech-loading	June 30, 1865.
49, 277	Joy, Miles.	West Greenville, Pa.	Boring tools	Aug. 8, 1865.
49, 415	Joyce, Joseph L.	New Haven, Conn.	Shoes	Aug. 15, 1865.

Lewis, S.	Tiffin, Ohio.	Bolts, flour.	Oct. 10, 1865.
Lewis, T. S., and J. W. Ricker. (See Ricker & Lewis.)			
Lewis, Wm. J.	Pittsburg, Pa.	Bolts, manufacture of.	Apr. 4, 1865.
Lewis, William K.	Boston, Mass.	Punch and die.	Apr. 4, 1865.
Lewis, William K.	Boston, Mass.	Iron, soldering.	May 7, 1865.
Leyboldt, Frederick C.	Philadelphia, Pa.	Baton-hole cutters.	May 30, 1865.
Lezat, Nelson.	New Baltimore, Md.	Water, mode of supplying railway trains with.	July 25, 1865.
Lezott, Lewis H.	Washington, D. C.	Shells, explosive.	Sept. 5, 1865.
Lilbrey, H. W.	Cleveland, Ohio.	Compound, incendiary.	Sept. 19, 1865.
Lilbrey, H. W.	Cleveland, Ohio.	Boot, ladies.	May 9, 1865.
Lilbrey, H. W.	Evansville, Wis.	Cultivator.	June 13, 1865.
Lidren, Christopher.	Aurora, Ill.	Trunks, roller cleat for.	June 13, 1865.
Lieb, John A., and John Schmadel.	Newark, N. J.	Tanning apparatus.	Jan. 31, 1865.
Lieb, John A., and John Schmadel. (See Schmadel & Lieb.)			
Liebermann, Henry, assignor to self, P. Nun, J. Weil, and G. Rock.	Paducah, Ky.	Phosphates, super, manufacture of.	Dec. 19, 1865.
Liebig, Gustavus A., assignor to Navassa Phosphate Company.	Baltimore, Md.	Process for manufacturing fertilizing phosphates.	Sept. 5, 1865.
Liebig, G. A., and E. K. Cooper.	Baltimore, Md.	Lubricating journal boxes, mode of.	Jan. 17, 1865.
Light, Joseph F.	Worcester, Mass.	Wood, method of oiling.	Sept. 26, 1865.
Lightfoot, Benj. H.	Philadelphia, Pa.	Condensers, tubular.	Jan. 24, 1865.
Lightthall, Wm. A.	New York, N. Y.		Jan. 31, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
46, 252	Lighthall, Wm. A.	New York, N. Y.	Boilers, steam, feed water heaters for.	Feb. 7, 1865.
46, 253	Lighthall, Wm. A.	New York, N. Y.	Condenser cases.	Feb. 7, 1865.
46, 254	Lighthall, Wm. A.	New York, N. Y.	Condensers.	Feb. 7, 1865.
46, 438	Lighthall, Wm. A.	New York, N. Y.	Condensers and refrigerators.	Feb. 14, 1865.
1, 878	Lighthall, Wm. A.	New York, N. Y.	Condensers. (Reissue.)	Feb. 21, 1865.
1, 879	Lighthall, Wm. A.	New York, N. Y.	Condensers, potable water.	Feb. 21, 1865.
47, 434	Lighthall, A. P.	Boston, Mass.	Inhaling vapors, apparatus for.	Apr. 25, 1865.
50, 722	Lighthall, A. P.	Boston, Mass.	Syringes, catarrhal.	Oct. 31, 1865.
47, 964	Lightner, Samuel N. (See Myers, James, assignor.)	Baltimore, Md.	Tobacco pipe.	May 30, 1865.
	Lillie, Frederick.	Troy, N. Y.	Safes, fire-proof.	July 11, 1865.
49, 282	Lillie, Lewis.	Troy, N. Y.	Locks.	Aug. 8, 1865.
51, 125	Lillie, Lewis.	Troy, N. Y.	Safes, vaults, and similar structures, metal, moulds for casting.	Aug. 8, 1865.
2, 112	Lillie, Lewis.	Troy, N. Y.	Safes, vaults, and similar structures, metal, moulds for casting. (Reissue.)	Nov. 21, 1865.
50, 769	Lincoln, James A., assignor to Amos A. Lincoln, Jr.	Norton, Mass.	Furnaces, cupola.	Oct. 31, 1865.
51, 465	Lindsay, J. P. (See Hammon, T. W., assignor.)	New Haven, Conn.	Wrench.	Dec. 12, 1865.
50, 014	Lindsay, J. P. (See Goodwin, William, assignor.)	Washington, Pa.	Hand, artificial.	Sept. 19, 1865.
47, 739	Lindsay, Oliver, and Isaac Vance.	Montville, Conn.	Paper-making machinery, rag engine of.	May 16, 1865.
51, 733	Link, Henry.	Little Falls, N. Y.	Shirt fastener.	May 16, 1865.
51, 898	Linscott, John M.	San Francisco, Cal.	Drill, rock.	Dec. 19, 1865.
46, 682	Linton, Thomas J.	Providence, R. I.	Sundal, ice.	Mar. 7, 1865.
46, 683	Linton, Thomas J.	Providence, R. I.	Pumps.	Mar. 7, 1865.
50, 723	Linville, Jacob H., and John L. Piper.	Pittsburg, Pa.	Bridges, wrought-iron.	Oct. 31, 1865.
45, 727	Lippman, Hymen L.	Altoona, Pa.	Eyeletting machines.	Jan. 3, 1865.
	Lippincott, Thomas, and James A. Hamer. (See Hamer & Lippincott.)	Philadelphia, Pa.		
50, 606	Lippincott, William J.	Pittsburg, Pa.	Saws, grinding and polishing.	Oct. 24, 1865.
48, 570	Lippy, David.	Mansfield, Ohio.	Dryer, fruit.	July 4, 1865.
49, 424	Lipsy, Andrew B.	New York, N. Y.	Tongs, gas-fitters'.	Aug. 15, 1865.
49, 125	Lister, David.	Carbondale, Pa.	Boilers, steam.	Aug. 1, 1865.
	Litchfield, H. T., et al. (See Bidwell, J. A., assignor.)	New York, N. Y.	Type, letter-press.	Apr. 18, 1865.
2, 054	Little, Andrew.	Danville, Ind.	Fruit gatherer.	Mar. 21, 1865.
46, 916	Little, James A.	Copake, N. Y.	Pot, coffee.	Mar. 21, 1865.
46, 917	Little, Lewis H.	Canton, Ohio.	Stove.	Feb. 14, 1865.
46, 422	Little R., assignor to self and Samuel Little.	Covington, Ky.	Preplaces.	Sept. 26, 1865.
2, 074	Littfield, Calvin A., assignor to self and David Boyle.	Albany, N. Y.	Sieve, base-burning.	Feb. 28, 1865.
1, 890	Littfield, Dennis G.	Albany, N. Y.	Sieve, base-burning. (Reissue.)	Feb. 28, 1865.
1, 976	Littfield, Dennis G.	Albany, N. Y.	Sieve, base-burning. (Reissue.)	May 30, 1865.
49, 283	Littfield, Hiram, and C. O. Morse. (See Estes, Samuel, assignor.)	Lewis, Iowa.	Scaffold.	Aug. 8, 1865.
46, 189	Littfield, Horace.	Cambridge, Mass.	Sifter, flour.	June 13, 1865.

48, 415	Littlefield, Joseph H.	Littlefield, Joseph H.	Cambridge, Mass.	Breaching hooks	June 27, 1865.
48, 416	Littlefield, Joseph H.	Littlefield, Joseph H.	Cambridge, Mass.	Whiffletrees	June 27, 1865.
49, 898	Littlefield, Joseph H.	Littlefield, Joseph H.	Cambridge, Mass.	Hammers	Sept. 12, 1865.
49, 899	Littlefield, Joseph H.	Littlefield, Joseph H.	Cambridge, Mass.	Damper and ventilator	Sept. 12, 1865.
51, 200	Livemore, Lorenzo D.	Livemore, Lorenzo D.	Beaver Dam, Wis.	Stump-extractor	Nov. 28, 1865.
46, 118	Lloyd, John A.	Lloyd, John A.	St. Paul, Minn.	Tire-shrinking machines	Jan. 31, 1865.
46, 192	Lloyd, Samuel, assignor to self and William H. Freer.	Lloyd, Samuel, assignor to self and William H. Freer.	Washington, D. C.	Horseshoes, movable calks and toes for	Jan. 31, 1865.
46, 255	Lochnan, C. L.	Lochnan, C. L.	Carlisle, Pa.	Funnels	Feb. 7, 1865.
48, 571	Locke, Harvey	Locke, Harvey	Boston, Mass.	Sifter, flour	July 11, 1865.
51, 201	Locke, Harvey	Locke, Harvey	South Boston, Mass.	Rubbers, machine for removing seeds from	Nov. 28, 1865.
49, 053	Locke, Harvey, assignor to John McNutt	Locke, Harvey, assignor to John McNutt	South Boston, Mass.	Lathes, wood-turning	July 25, 1865.
51, 734	Locke, Joel	Locke, Joel	Bridgeport, N. J.	Jack, lifting	Dec. 26, 1865.
49, 348	Locke, Sylvanus D., assignor to George G. Campbell	Locke, Sylvanus D., assignor to George G. Campbell	Janesville, Wis.	Car-coupling	Aug. 8, 1865.
51, 590	Locke, Sylvanus D.	Locke, Sylvanus D.	Janesville, Wis.	Grain binders	Dec. 19, 1865.
51, 600	Locke, Sylvanus D.	Locke, Sylvanus D.	Janesville, Wis.	Grain binders	Dec. 19, 1865.
49, 772	Lockwood, Edwin	Lockwood, Edwin	Bordentown, N. J.	Axle box	Sept. 5, 1865.
48, 191	Lockwood, Edwin, and George W. Pitman	Lockwood, Edwin, and George W. Pitman	Bordentown, N. J.	Car seats	June 13, 1865.
49, 900	Lockwood, Hamilton D. (See Davidson, C. H. and H. E., assignors.) Reissue.	Lockwood, Hamilton D. (See Davidson, C. H. and H. E., assignors.) Reissue.	Charlestown, Mass.	Syringes	Sept. 12, 1865.
51, 338	Lockwood, Rutcliffe B. (See Leland, Edwin A., assignor.)	Lockwood, Rutcliffe B. (See Leland, Edwin A., assignor.)	Brooklyn, N. Y.	Bridges	Dec. 5, 1865.

	Maxwell, J. B., <i>et al.</i> (See Gilbert, George W., assignor.)			
	Maxwell, Leonard			
	May, Franklin J.			

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
50,608	May, Henry.	Bridgport, Conn.	Blowmossing wood, made of	Oct. 21, 1865.
50,944	May, H. H.	Chatsburg, Ill.	Water elevators	Nov. 14, 1865.
48,823	May, John M.	Janesville, Wis.	Drill, rock	July 18, 1865.
49,129	May, John M.	Janesville, Wis.	Drill	Aug. 1, 1865.
49,286	May, John M.	Janesville, Wis.	Drills	Aug. 8, 1865.
50,090	May, John M.	Janesville, Wis.	Drills, rock	Sept. 19, 1865.
48,701	May, John M. and Edwin B. Godfrey	Janesville, Wis.	Drills, portable	July 11, 1865.
45,728	Maycock, Henry	Yerona, N. Y.	Stanchion, cattle	Jan. 3, 1865.
48,595	Mayer, John	Philadelphia, Pa.	Brushes, hair	June 29, 1865.
49,549	Mayer, John	Philadelphia, Pa.	Pontons and seats, rotating, for barbers' shops, combined	Aug. 22, 1865.
46,374	Mayer, John M.	New York, N. Y.	Grain, machine for hulling and cleaning	Feb. 14, 1865.
49,776	Mayhew, Jonathan, and Thomas S. Lary. (See Stuber & Frank, assignors.) Reissue.	East Hampton, Mass.	Oil cans	Sept. 5, 1865.
46,098	Mayhew, T.	Poughkeepsie, N. Y.	Photographic card mount	Jan. 24, 1865.
51,336	Mayhew, Theophilus	New York, N. Y.	Drills, rock	Dec. 5, 1865.
48,194	Maynard, George	Brooklyn, N. Y.	Print knife and mill pick	June 13, 1865.
47,853	Maynard, Edward	Washington, D. C.	Bathons	May 23, 1865.
48,473	Maynard, Edward	Washington, D. C.	Pneumons, breech loading	June 27, 1865.
49,965	Maynard, Edward	Washington, D. C.	Cartridge retractor, for breech-loading firearms	July 25, 1865.
49,130	Maynard, Edward	Washington, D. C.	Pneumons, breech loading	Aug. 1, 1865.
50,833	Mayo, John K.	Portland, Me.	Board, scale, and match splints, machines for ending	Nov. 7, 1865.
51,725	Mayo, John K.	Portland, Me.	Material for roofing tubing, tanks, watersteering, boat and other structures.	Dec. 25, 1865.
49,921	Mayor, Thomas	Pawtucket, R. I.	Reeling frames, dyes for	Mar. 21, 1865.
46,530	Mayor, Thomas, assignor to George Chaffertion	Pawtucket, R. I.	Reeling frames	Feb. 21, 1865.
1,950	Mayor, Thomas, assignor to George Chaffertion	Pawtucket, R. I.	Reeling frames	May 9, 1865.
	McAdams, John	Brooklyn, N. Y.	Books, account, machines for numbering the pages of. (Reissue.)	Aug. 11, 1865.
51,068	McAfee, Daniel	Pittsburg, Pa.	Glass pots	Nov. 21, 1865.
48,792	McArthur, William	Philadelphia, Pa.	Feather retractor	July 11, 1865.
46,302	McAvey, Hugh L., assignor to self and Elias S. Hutchinson	Baltimore, Md.	Air, apparatus for carburetting	Feb. 7, 1865.
50,075	McAvey, Hugh L., assignor to self and Elias S. Hutchinson	Baltimore, Md.	Burners, gas	Sept. 19, 1865.
50,046	McAvey, Hugh L., assignor to self and Elias S. Hutchinson	Baltimore, Md.	Air, apparatus for carburetting	Sept. 19, 1865.
2,069	McAvey, Hugh L., assignor to self and Elias S. Hutchinson	Baltimore, Md.	Air, apparatus for carburetting	Sept. 19, 1865.
51,304	McCaig, Samuel	Philadelphia, Pa.	Car brakes	Sept. 5, 1865.
51,069	McCarthy, William C.	Pittsburg, Pa.	Measuring liquids in casks, instruments for. (Ante-dated May 21, 1865.)	Nov. 28, 1865.
49,640	McCauley, Reuben A.	Baltimore, Md.	Pumps	Nov. 21, 1865.
51,736	McCauley, Reuben A.	Baltimore, Md.	Pumps	Dec. 25, 1865.
49,477	McClary, Andrew J., and Otto Knolson. (See Knolson & McClary.)	Hyde Park, Pa.	Pumps, rollers	Aug. 15, 1865.
46,571	McClary, Andrew J., assignor to Wm. P. Connell & Wm. M. Silkman	Washington, D. C.	Valves, stop	Feb. 28, 1865.
46,572	McClard, John	Washington, D. C.	Street washers	Feb. 28, 1865.
	McClendon, J., and R. Thayer. (See Thayer & McClendon.)			

McClintock, William, assignor to self and G. G. Lobdell.....	Winnington, Del.	Valve gear, cut-off.....	Oct. 3, 1865.
McCloskey, John, assignor to self and Samuel B. Ballou.....	New York, N. Y.	Sewing machines.....	June 20, 1865.
McCloskey, John, assignor to Henry McCuekin.....	New York, N. Y.	Holding apparatus, water.....	Oct. 10, 1865.
McCormick, Robert.....	Jacksonville, Ill.	Tool for fastening tubes in boilers.....	Aug. 8, 1865.
McConnell, Robert.....	Lawrenceville, Pa.	Nails, instruments for extracting.....	Nov. 7, 1865.
McCorkell, Robert.....	Philadelphia, Pa.	Cultivators.....	Oct. 3, 1865.

46, 329	Metropolitan Washing Machine Co. (See Pease, Jas. N., assignor.)	New York, N. Y.	Hoar, spring.	Feb. 21, 1865.
46, 607	Metropolitan Washing Machine Co. (See Conch, John O., assignor.)	Richmond, N. Y.	Wicks, mode of making.	Feb. 28, 1865.
47, 068	Metropolitan Washing Machine Co. (See Conch, John O., assignor.)	Clifton, N. Y.	Process for removing mineral, gummy, and resinous substances from vegetable fibre.	Mar. 28, 1865.
49, 351	Metzler, Henry E., assignor to self and Thomas G. Cowperthwaite.	Philadelphia, Pa.	Printer, ice.	Aug. 8, 1865.
51, 241	Meyer, Frederick C., assignor to Ernestine Meyer.	Washington, D. C.	Latch and bolt combined.	Oct. 3, 1865.
50, 412	Mignott, J., and S. H. Bonart.	France.	Freezing liquids, apparatus for.	Sept. 26, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
48, 772	Milhan, Patrick, assignor to Oliver P. Drake.	Boston, Mass.	Air, apparatus for carburetting.	July 11, 1865.
46, 125	Milbank, Isaac M.	Greenfield Hill, Conn.	Fire-arms, breech-loading.	Jan. 31, 1865.
46, 873	Milburn, Benjamin T., assignor to self and Joseph Rigby.	Wilmington, Del.	Railway chairs.	July 18, 1865.
46, 873	Miles, C. M., and J. S. Hoard. (See Hoard and Miles.)			
46, 304	Miles, Nathaniel, assignor to Bay State Hardware Company.	Tuckland, Mass.	Cutlery, table.	Feb. 7, 1865.
49, 289	Miles, O. E.	Aurora, Ill.	Vehicles. (Antedated August 7, 1865.)	Aug. 8, 1865.
50, 149	Millar, Henry W.	New York, N. Y.	Curtain fixtures.	Sept. 26, 1865.
50, 022	Millar, M. J. A., assignor to H. A. G. Du Vergier.	Utica, N. Y.	Caus, construction of.	Sept. 19, 1865.
49, 596	Millen, W. H., and Mathias J. Rice. (See Rice & Millen.)	France.	Air, apparatus for carburetting.	Aug. 22, 1865.
	Miller, August, and Fitch Raymond. (See Raymond & Miller.)			
	Miller, August, and Fitch Raymond. (See Raymond & Miller.)			
48, 195	Miller, Charles.	Cincinnati, Ohio.	Broom head.	June 13, 1865.
51, 658	Miller, Charles E., assignor to self and Frank Dial.	Cincinnati, Ohio.	Broom head.	Dec. 19, 1865.
48, 196	Miller, Charles T.	Providence, R. I.	Sifter, ash.	June 13, 1865.
50, 609	Miller, Edwin F., and Bela Gardner.	Williamsburg, Hampshire county, Mass.	Belts together, machine for drawing.	Oct. 24, 1865.
46, 126	Miller, Ezra.	Janesville, Wis.	Car coupler and buffer.	Jan. 31, 1865.
45, 932	Miller, George.	Washington, D. C.	Gauges, carpenters'.	Jan. 17, 1865.
50, 484	Miller, George W., and Albert Watson. (See Watson & Miller.)	Washington, D. C.	Gauges, carpenters'.	Oct. 18, 1865.
45, 847	Miller, Henry J.	Shanesville, Ohio.	Sawing machines.	Jan. 10, 1865.
47, 170	Miller, Ivo B. and William H.	Philadelphia, Pa.	Unbricating the packing of stuffing boxes, &c.	Apr. 4, 1865.
47, 119	Miller, Ivo B. and William H.	Philadelphia, Pa.	Pistons, &c., manufacture of packing for.	Apr. 4, 1865.
48, 435	Miller, James.	St. Louis, Mo.	Grates.	June 27, 1865.
47, 442	Miller, John.	Buffalo, N. Y.	Faucet, beer.	Apr. 25, 1865.
50, 213	Miller, John.	Russellville, Ky.	Planters, feed.	Sept. 26, 1865.
46, 259	Miller, John A.	Paducah, Ky.	Ordinance, breech-loading.	Feb. 7, 1865.
50, 610	Miller, John A.	Somerville, Ohio.	Broom-head.	Oct. 24, 1865.
46, 127	Miller, Joseph A.	New York, N. Y.	Grate bars for furnaces, casting.	Jan. 31, 1865.
47, 118	Miller, Joseph A.	New York, N. Y.	Furnace, boiler.	Apr. 4, 1865.
47, 443	Miller, Joseph A.	New York, N. Y.	Furnace, hot air.	Apr. 25, 1865.
50, 611	Miller, Joseph A.	New York, N. Y.	Boilers, cast-iron.	Oct. 24, 1865.
	Miller, Joseph R., and Joseph W. Wayne. (See Wayne & Miller.)			
51, 070	Miller, Lewis.	Akron, Ohio.	Harvesters, rake attachments to.	Nov. 21, 1865.
51, 071	Miller, Lewis.	Akron, Ohio.	Harvesters, rake attachments to.	Nov. 21, 1865.
46, 922	Miller, Rutgers B.	Utica, N. Y.	Flores of epilobium, manufacture from.	Mar. 21, 1865.
48, 578	Miller, Samuel J., Albert B. Barnett, and William H. Study.	Economy, Ind.	Hides, apparatus for tanning.	July 4, 1865.
46, 138	Miller, Thomas.	Columbus, Ohio.	Canal scraper.	Jan. 31, 1865.
2, 003	Miller, William.	Cincinnati, Ohio.	Hoisting machine.	June 20, 1865.
2, 063	Miller, William.	Cincinnati, Ohio.	Hoisting machine.	Sept. 5, 1865.
2, 066	Miller, William.	Cincinnati, Ohio.	Hoisting machine.	Sept. 5, 1865.
48, 579	Miller, William.	Cincinnati, Ohio.	Hoisting machine.	July 4, 1865.

Miller, William. (See Simmons, Franklin, assignor.) Design.	West Meriden, Conn.	Fire-arms, breech-loading.	Dec. 26, 1865.
Miller, William. (See Simmons, Franklin, assignor.) Design.	Meriden, Conn.	Fire-arms, breech-loading.	May 23, 1865.
Miller, William. (See Simmons, Franklin, assignor.) Design.	Albany, N. Y.	Boxes, paper, construction of.	Mar. 28, 1865.
Miller, William. (See Simmons, Franklin, assignor.) Design.	Albany, N. Y.	Baskets, machinery for forming.	May 2, 1865.
Miller, William. (See Simmons, Franklin, assignor.) Design.	New York, N. Y.	Table for the sick.	Sept. 12, 1865.
Miller, William. (See Simmons, Franklin, assignor.) Design.	New York, N. Y.	Petroleum, &c., apparatus for distilling.	Mar. 21, 1865.
Miller, William H. and G. W. assignors to Edmund Parker.	New York, N. Y.	Petroleum, instrument for testing.	Sept. 5, 1865.
Miller, William H. (See Hiquit, Zebulon, assignor.)	Bristol, Conn.	Coffee roaster.	Nov. 7, 1865.
Miller, John W. assignor to J. A. Sumner.	Washington, D. C.	Casts from the face of living persons, mode of taking.	Apr. 4, 1865.
Miller, John W. assignor to B. R. Jenkins and C. Sumner.	Washington, D. C.		
Millhauser, Aselein.	Washington, D. C.		
Milliken, Geo. F., and Moses G. Farmer. (See Farmer & Milliken.)	Washington, D. C.		
Millen, William B. (See Knukel, Frank, assignor.)	Washington, D. C.		
Millican, Adolph.	New York, N. Y.	Oil ejectors.	June 6, 1865.
Millican, Adolph.	New York, N. Y.	Pumps.	Apr. 23, 1865.
Mills, C. A., assignor to the Ureka Manufacturing Company.	New York, N. Y.	Well, oil, tubes, packing for.	July 18, 1865.
Mills, Clark.	New York, N. Y.	Cultivators.	Sept. 5, 1865.
Mills, Clark W. (See Cliechester, Lewis S., assignor.)	Reading, Ill.	Engines, steam, governor valves for.	May 9, 1865.
Mills, Clark W. (See Cliechester, Lewis S., assignor.)	Bergen, N. J.	Yessel's hold, apparatus for levelling grain in a.	July 25, 1865.
Mills, C. W., et al. (See Tuggart, Cliechester & Mills.)	Buffalo, N. Y.	Lanterns.	Mar. 28, 1865.
Mills, Frank.	Milwaukee, Wis.	Derrick, hay.	Aug. 8, 1865.
Mills, George E.	Kansas, Ill.	Cultivator.	Sept. 26, 1865.
Mills, George E.	McKee's Half Falls, Pa.	Gates, mode of hanging.	Feb. 14, 1865.
Mills, George E.	Meadville, Pa.	Lantern, pocket.	Feb. 14, 1865.
Mills, George E.	Middle-town, Conn.	Umbrella holders.	Jan. 24, 1865.
Mills, Jared W. (See Robeson, Robert J., assignor.)	Middle-town, Conn.	Bolt-heading machines.	Oct. 17, 1865.
Mills, Joseph.	Worcester, Mass.	Furnace, isometric diaphragm, for desulphurizing ores.	Nov. 7, 1865.
Mills, Samuel.	New York, N. Y.		
Mills, William M., et al. (See Roberts, E., assignor.) Reissue.	St. Louis, Mo.	Mattress, spring.	Feb. 28, 1865.
Milson, George, Henry Spindeloff, and G. V. Watson.	Richmond, Ind.	Measure, funnel, and faucet, combined.	Mar. 7, 1865.
Mitmore, J. H.	Richmond, Ind.	Stoves, cook.	May 23, 1865.
Minnick, William.	Waterbury, Conn.	Buckles machinery for making.	Dec. 19, 1865.
Minnich, Elias.	El Paso, Ill.	Plough, gang, and cultivator.	Feb. 14, 1865.
Minniss, Thomas S.			
Minor, John A.			
Minor, John A.			
Minor, James, assignor to self, J. Hope, and R. H. Butcher.			
Minchom, Daniel.			
Minchom, George E. (See Armington, William W., assignor.)			
Minchell, George E. (See Armington, William W., assignor.)			
Minchell, George E. (See Welch & Armington, assignors.)			
Minchell, G. W.			
Minchell, Henry.			
Minchell, Henry.			
Minchell, Lamson P.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
45,767	Stevens, James H.	East Durham, N. Y.	Manure, device for spreading.	Jan. 3, 1865.
49,006	Stevens, James H.	East Durham, N. Y.	Wagons, unloading, attachment for.	July 25, 1865.
2,037	Stevens, John.	New York, N. Y.	Shirt-bosom folders.	Oct. 24, 1865.
48,032	Stevens, John, assignor to self and Theodore Bourne.	New York, N. Y.	Gins, cotton.	May 30, 1865.
48,850	Stevens, John W.	South Danvers, Mass.	Steam blowers.	July 10, 1865.
45,874	Stevens, Judd.	Morango, N. Y.	Sleds.	Jan. 18, 1865.
51,239	Stevens, Martin W.	Stoughton, Mass.	Sewing machines, embrodering attachment for.	Nov. 28, 1865.
48,851	Stevens, Nathan P.	Boston, Mass.	Engines, steam, pistons for.	July 18, 1865.
1,933	Stevens, Oliver P.	Cleveland, Ohio.	Hulling and scouring machines.	Mar. 28, 1865.
	Stevens, Simon. (See Simpson, Edwin L., assignor.)			
	Stevens, Simon. (See Simpson, Edwin L., assignor.)			
	Stevens, Simon. (See Simpson, Edwin L., assignor.)			
	Stevens, Wm. J., assignor through mesne assignments to N. W. Condit and D. S. Steele.			
1,957	Stevens, Wm. W., assignor to N. P. Richardson & Co.	Jersey City, N. J.	Engines, steam, means of operating the valves of.	May 16, 1865.
2,036	Stevenson, J. E.	Portland, Me.	Stove, cook, plates of a.	Feb. 28, 1865.
48,737	Stewart, John D.	New York, N. Y.	Water-wheels.	July 11, 1865.
46,338	Stewart, John D.	Baltimore, Md.	Pipe, smoking.	Feb. 28, 1865.
48,320	Stewart, J. J., and John A. Roche. (See Roche & Stewart.)	Troy, N. Y.	Tobacco pipes.	June 20, 1865.
47,049	Stewart, Philo P.	Troy, N. Y.	Stoves, furnaces, &c., fire pot for.	Mar. 28, 1865.
48,143	Stewart, Philo P.	Troy, N. Y.	Stoves coal.	June 6, 1865.
2,033	Stewart, Philo P.	Fultonham, N. Y.	Stoves coal.	July 4, 1865.
45,876	Stewart, Robert.	Brooklyn, N. Y.	Water-wheels.	Jan. 10, 1865.
46,724	Stewart, Samuel M., and Robert Perrine. (See Perrine & Stewart.)	Hoboken, N. J.	Filtering liquids, &c., apparatus for.	Mar. 7, 1865.
45,768	Stasiemy, Leonard T.		Wool, refuse, for use, process for preparing.	Jan. 3, 1865.
	Stickney, Leonard J. (See Kirchhof, Charles, assignor.)			
2,031	Stiles, Edwin C.	East Cambridge, Mass.	Burial cases.	Feb. 14, 1865.
46,401	Stiles, Norman C.	Portland, Me.	Milling machine.	Feb. 14, 1865.
2,139	Stillman, C. A., assignor to C. B. Cottrill and N. Babcock.	Meriden, Conn.	Press, punching.	Dec. 26, 1865.
51,522	Stillman, C. A.	Westerley, R. I.	Pumps.	Dec. 12, 1865.
50,507	Stillman, O. M.	Springfield, Mass.	Fire-arms, breech-loading.	Dec. 12, 1865.
48,321	Stillman, Daniel C., and John C. Chapman.	Westerley, R. I.	Engines, steam.	Oct. 17, 1865.
50,748	Stillwell, J., et al. (See Wheeler, S. H., assignor.)	Charlestown, Mass.	Tongs, pipe.	June 20, 1865.
	Stine, S. J., et al. (See Scanlon, James, assignor.)			Oct. 31, 1865.
49,007	St. John, B. F.	Baldwinsville, Mass.	Bracket, clothes.	July 25, 1865.
49,802	St. John, B. F., and Henry Horst.	Shelbyville, Ind.	Levels, pendulum.	Sept. 5, 1865.
50,508	St. John, Cornelius.	Boston, Mass.	Brick and tile machine.	Oct. 17, 1865.
50,509	St. John, C., as't, through mesne assignments, to Chas. C. Beers		Lamp shade.	Oct. 17, 1865.
			Lamp shade.	July 4, 1865.
48,632			Lamp, holder for.	Feb. 21, 1865.

49, 008	St. John, Edgar, <i>et al.</i> (See Monroe, Stone & St. John.)	Kalamazoo, Mich.	Cultivators	July 25, 1865.
50, 967	St. John, Garland B.	Bellefontaine, Ohio	Wells, method of sinking	Nov. 14, 1865.
51, 096	St. John, R. H.	St. Louis, Mo.	Cultivators	Nov. 21, 1865.
49, 315	St. John, W. W.	New York, N. Y.	Cameras, photographic	Aug. 8, 1865.
	Stock, John			
50, 287	Stockise, Abner C. (See Whitney & Hardison, assignors.)	Oil City, Pa.	Tools, boring, coupling for shafts of	Oct. 3, 1865.
47, 050	Stockton, Job B.	North Chenango, Pa.	Dough, apparatus for raising	Mar. 28, 1865.
48, 459	Stockwell, Thomas	Brooklyn, N. Y.	Lighter, gas, fulminate. (Antedated June 17, 1865.)	June 27, 1865.
48, 460	Stockwell, Henry B.	Brooklyn, N. Y.	Compound, fulminating. (Antedated June 17, 1865.)	June 27, 1865.
45, 769	Stoddard, Joshua C.	Worcester, Mass.	Rakes, horse	Jan. 3, 1865.
45, 876	Stoffel, Ignatius	Washington, D. C.	Arms, artificial	Jan. 10, 1865.
48, 219	Stoker, H. M.	Watson, Ill.	Pumps, submerged	June 13, 1865.
48, 220	Stoker, H. M.	Watson, Ill.	Pumps, submerged	June 13, 1865.
49, 009	Stokes, Benjamin S.	Manchester, N. H.	Crucible for metallic baths	July 25, 1865.
50, 495	Stolker, Joseph, assignor to self and J. W. McKenzie	Pine Run, Mich.	Wheels	Oct. 10, 1865.
	Stoll, H. C., <i>et al.</i> (See Garnell, Bez & Stott.)			
50, 853	Stone, A. C.	Steeleville, Pa.	Rakes, horse	Nov. 7, 1865.
51, 097	Stone, A. C.	Steeleville, Pa.	Rakes, horse. (Antedated November 13, 1865.)	Nov. 21, 1865.
51, 489	Stone, B. L.	New York, N. Y.	Alarm, burglar	Dec. 12, 1865.
46, 402	Stone, Bernhard L.	San Francisco, Cal.	Alarm, burglar	Feb. 14, 1865.
46, 035	Stone, D. C.	Kingston, N. Y.	Mill-stone pick	Jan. 24, 1865.
	Stone, E., <i>et al.</i> (See Monroe, Stone & St. John.)			
49, 316	Stone, Edward E.	U. S. Navy	Hooks, elastic, mousing for	Aug. 8, 1865.
46, 154	Stone, George	Boston, Mass.	Spikes, tool for drawing	Jan. 31, 1865.
46, 830	Stone, Gustavus, and Joseph P. Bullock	Beloit, Wis.	Harvesters	Mar. 14, 1865.
50, 047	Stone, Isaac H.	St. Louis, Mo.	Tobacco, baling, apparatus for packing	Sept. 19, 1865.
	Stone, James B. (See Norman, William, assignor.)			
2, 226	Stone, J. H.	Philadelphia, Pa.	Vessels, water, sheet metal base of. (Design.)	Dec. 5, 1865.
47, 667	Stone, J. M.	North Andover, Mass.	Drawing frame rolls	May 9, 1865.
46, 278	Stone, J. M., assignor to self, Geo. L. Davis, and J. A. Wiley	North Andover, Mass.	Eccentric adjustment	Feb. 7, 1865.
47, 876	Stone, J. M., assignor to self, Geo. L. Davis, and J. A. Wiley	North Andover, Mass.	Fastening, lath	May 23, 1865.
50, 641	Stone, Othniel	Rochester, N. Y.	Diseases by condensed air, treating	Oct. 24, 1865.
	Stone, Paschal, and Francis D. Hayward. (See Hayward & Stone.)			
46, 279	Stone, Samuel S.	Troy, N. Y.	Collar, paper, button-hole punchers	Feb. 7, 1865.
2, 024	Stone, Samuel S.	Troy, N. Y.	Button-holes, inclining and embossing, and printing articles of wearing apparel, machine for. (Reissue.)	July 4, 1865.
	Stone, William H.	Brooklyn, N. Y.	Barrels, petroleum, lining for	May 2, 1865.
47, 581	Stoops, Nesbitt D.	Newark, N. J.	Sewing machines, carriages and castor for	July 18, 1865.
42, 852	Stoops, Nesbitt D.	Newark, N. J.	Castor for sewing machines	Oct. 10, 1865.
50, 402	Storer, Jacob J., and J. D. Whelpley. (See Whelpley & Storer.)			
	Storer, Jacob J., and J. D. Whelpley. (See Whelpley & Storer.)			
	Storer, Jacob J., and J. D. Whelpley. (See Whelpley & Storer.)			
	Storer, Jacob J., and J. D. Whelpley. (See Whelpley & Storer.)			
48, 494	Storm, William Mont, assignor to self and C. J. Ferguson	Harlem, N. Y.	Spikes, railroad	June 27, 1865.
48, 777	Storm, William Mont, assignor to self and R. C. Mitchell	New York, N. Y.	Engines, steam	July 11, 1865.
49, 199	Storm, William Mont, assignor to self and R. C. Mitchell	New York, N. Y.	Boilers, steam	Aug. 1, 1865.
51, 098	Story, Ira C.	Cincinnati, Ohio	Locomotives, street, running gear of	Nov. 21, 1865.
	Stout, A. L., assignor. (See Roberts, Elijah, assignor.) Reissue.			
46, 954	Stovel, George	Chicago, Ill.	Gates	Mar. 21, 1865.
50, 510	Stover, H. D.	New York, N. Y.	Lathes, stands for	Oct. 17, 1865.
	Stow, Enos E., and James F. Brewer. (See Brewer & Stow.)			

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
48, 598	Stow, John E. (See Holden, Henry, assignor.)	Plattsville, Conn.	Sausage filler.	July 4, 1865.
51, 240	Stow, Orson W.	Plattsville, Conn.	Stove-pipe elbow.	Nov. 28, 1865.
46, 725	Strange, Emerson C., and George R. Hunley.	Stanton, Mass.	Furnace, boiler.	Mar. 7, 1865.
46, 726	Strater, Herman, Jr.	Boston, Mass.	Faucets.	Mar. 7, 1865.
46, 727	Strater, Herman, Jr.	Boston, Mass.	Faucets.	Mar. 7, 1865.
46, 728	Strater, Herman, Jr.	Boston, Mass.	Faucets.	Mar. 7, 1865.
47, 582	Stratton, A. H.	New York, N. Y.	Fifes and flutes.	May 2, 1865.
45, 877	Stratton, Charles H.	Monroctown, Pa.	Digging machine.	Jan. 10, 1865.
48, 461	Stratton, Henry, and Elliot Savage. (See Savage & Stratton.)	Brooklyn, N. Y.	Lamps, street.	June 27, 1865.
49, 010	Stratton, James.	Brooklyn, N. Y.	Burner, gas chimney.	July 25, 1865.
51, 121	Stratton, James, assignor to self and John Hinshillwood.	Philadelphia, Pa.	Burners, gas.	Nov. 21, 1865.
49, 955	Stratton, James E., assignor to the Petroleum Vapor Stove and Gas-light Company.	Philadelphia, Pa.	Burners, vapor.	Sept. 12, 1865.
51, 363	Stratton, John F.	New York, N. Y.	Musical instruments, mute for.	Dec. 5, 1865.
49, 317	{ Stratton, Wiley J., and H. G. Tideman	St. Louis, Mo.	Tobacco, machine for cutting.	Aug. 8, 1865.
51, 099	Strober, Lewis.	New York, N. Y.	Ointment.	Nov. 21, 1865.
49, 168	Strode, T. T.	Jersey City, N. J.	Adding machines.	Aug. 1, 1865.
49, 169	Strode, T. T.	Mortonville, Pa.	Clocks, calendar.	Aug. 1, 1865.
2, 064	Strong, Alvah. (See Lamb, Isaac W., assignor.)	Chatham, Conn.	Coffin handle.	May 9, 1865.
51, 490	Strong, B., and M. H. Crosby. (See Crosby, Thomas G., ass'n.)	Onondaga, N. Y.	Hay forks, horse.	Dec. 12, 1865.

47, 531	Taylor, S. C.	Washington, D. C.	Shells, explosive, fuse hood for	Apr. 11, 1865.
	Taylor, Thomas			
	Taylor, V. N., et al. (See Hutchinson, S. B., assignor.)			
	Taylor, V. N., and G. W. Ray. (See Hook, Albert H., assignor.)			
	Taylor, V. N., and G. W. Ray. (See Hook, Albert H., assignor.)			
	Taylor, V. N., and G. W. Ray. (See Hook, Albert H., assignor.)			
50, 896	Taylor, William	East Zora, Canada	Carriages springs	Nov. 7, 1865.
46, 507	Taylor, William B. S.	New York, N. Y.	Gas, illuminating, flexible tubing for	Feb. 21, 1865.
48, 324	Tensdale, H. M.	Dunstable, N. Y.	Cultivators	June 20, 1865.
50, 514	Telbetta, Temple	New York, N. Y.	Collars, paper, cards, &c., from the printing or embossing press, removing.	Oct. 17, 1865.
	Teal, William, et al. (See Clouto, William, assignor.)			
48, 603	Tempest, James R.	Philadelphia, Pa.	Keys, lock, device for fastening	July 4, 1865.
49, 569	Temple, Abazo	Bridgeport, Conn.	Boilers, composition for preventing and removing incrustation from.	Aug. 22, 1865.
48, 325	Temple, C. C.	Saco, Me.	Looms, cloth, registering attachment for	June 20, 1865.
	Temple, J., et al. (See Robert, Elijah, assignor.)			
	Temple, J., et al. (See Robert, Elijah, assignor.)			

51, 523	Temple, James, assignor to self and H. P. Hottenstein. Terrell, E. P., and T. J. Blackburn. (See Blackburn & Terrell.) Terrell, E. C. (See French, A. F., assignor.) Terrell, E. C. (See French, E. F., assignor.)	Sellin's Grove, Pa.	Railroad tracks, mode of raising	Dec. 12, 1865.
46, 280	Terry, John B.	Auburndale, Mass.	Air, apparatus for carburetting	Feb. 7, 1865.
49, 924	Terry, William E.	Auburndale, Mass.	Air, apparatus for carburetting	Sept. 12, 1865.
48, 740	Teter, David B., assignor to self and Samuel C. Dickinson.	Wyomond, N. Y.	Tanning, process for	Sept. 11, 1865.
47, 685	Tewksbury, A. J.	Batavia Station, Iowa.	Spinning machines, hand, mode of adjusting band on	May 9, 1865.
50, 642	Thacher, Charles. (See Shove, George, assignor.)	Haverhill, Mass.	Sewing machine, device for registering the number of shoes soled by a.	Oct. 24, 1865.
48, 136	Thacher, Charles, assignor to self and George Shove.	Yarmouth, Mass.	Cranberry galterer	July 4, 1865.
50, 643	Thacker, John	New Lexington, Ohio	Wells, artesian, boring apparatus for	July 4, 1865.
50, 750	Thackray, George	Myrtle Bridge, Conn.	Engines, steam, slide-valves for	Oct. 31, 1865.
50, 050	Thayer, David N.	Mayville, N. Y.	Shovel, snow	Oct. 31, 1865.
47, 031	Thayer, Eli	Worcester, Mass.	Pumps, steam, automatic	Sept. 19, 1865.
47, 053	Thayer, Eli	Worcester, Mass.	Grates, tubular	Mar. 28, 1865.
47, 054	Thayer, Eli	Worcester, Mass.	Grates, tubular	Mar. 28, 1865.
47, 332	Thayer, Eli	Worcester, Mass.	Steam generators	Mar. 28, 1865.
49, 171	Thayer, Eli	Worcester, Mass.	Boiler, steam, sediment-extractor for	Mar. 28, 1865.
49, 172	Thayer, Eli	Worcester, Mass.	Glass by exposure to heat, method of preventing the breaking of	Apr. 11, 1865.
50, 403	Thayer, R., and J. M. McClelland.	Pittsburg, Ind.	Steam generators	Aug. 1, 1865.
47, 203	Thayer, Francis S.	Troy, N. Y.	Cultivators	Oct. 10, 1865.
50, 751	Thielling, John H. (See Cajar, Emil, assignor.)	Frederick, Md.	Bols, flour	Apr. 11, 1865.
50, 665	Thomas, Alfred V.	Milton, N. Y.	Lock, night, travellers'	Oct. 31, 1865.
48, 111	Thomas, Charles H., assignor to self and Hermon Thomas.	New York, N. Y.	Presses, cider	Oct. 24, 1865.
47, 468	Thomas, George Hayward	New York, N. Y.	Carriage axles	June 6, 1865.
46, 792	Thomas, James C.	Red Point, Md.	Planter, corn	Apr. 25, 1865.
47, 055	Thomas, I. H., and P. P. Mast	Springfield, Ohio	Seeding machines, attaching drill-teeth to	Mar. 7, 1865.
47, 138	Thomas, I. H., and P. P. Mast	Springfield, Ohio	Cultivators	Mar. 28, 1865.
48, 112	Thomas, I. H., and P. P. Mast	Springfield, Ohio	Fertilizers, machine for distributing	Apr. 4, 1865.
50, 545	Thomas, I. H., and P. P. Mast	Springfield, Ohio	Drills, grain, drag-bars for	Apr. 4, 1865.
51, 101	Thomas, I. H., and P. P. Mast	Springfield, Ohio	Drills, grain	June 6, 1865.
51, 494	Thomas, I. H., and P. P. Mast, and Thomas Harding.	Springfield, Ohio	Mill, cider	Oct. 17, 1865.
49, 173	Thomas, Levi H.	Springfield, Ohio	Seed brake	Nov. 21, 1865.
49, 174	Thomas, Levi H.	Waterbury, Vt.	Cultivators	Dec. 12, 1865.
50, 644	Thomas, Lloyd	New Philadelphia, Ill.	Traps, steel	Aug. 1, 1865.
46, 156	Thomas, N. Spencer	Painted Post, N. Y.	Strip boiler and evaporator	Aug. 1, 1865.
49, 319	Thomas, N. Spencer	Painted Post, N. Y.	Extracts, fluid, concentrated, process for making	Oct. 24, 1865.
1, 966	Thomas, Robert	Buffalo, N. Y.	Mills, bark	Jan. 31, 1865.
49, 175	Thomas, Robert, and Giles Edwards	Columbiana, Ala.	Ship's knee (Reissue)	Aug. 8, 1865.
47, 138	Thomas, William	Ottawa, Ill.	Iron, wrought, manufacture of	May 23, 1865.
49, 455	Thomas, William M.	Binghamton, N. Y.	Canal lock gates, device for raising	Aug. 1, 1865.
46, 723	Thomas, William R.	Catsaquo, Pa.	Racks, hay, for wagons	Apr. 4, 1865.
	Thompson, Albert. (See Johnson, Warren, assignor.)		Piston packing	Aug. 13, 1865.
48, 113	{ Thompson, Edwin, and	Abington, Mass.	Shoes, machine-sowed, manufacture of	Mar. 7, 1865.
	{ L. R. Mearns	Brooklyn, N. Y.	Carpet pattern	June 6, 1865.
2, 109	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern	July 4, 1865.
2, 110	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern	July 4, 1865.
2, 111	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern	July 4, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
2,112	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,113	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,114	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,115	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,116	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,117	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,118	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,119	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,120	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,121	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,122	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,123	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,124	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,125	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,126	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,127	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,128	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,129	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,130	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,131	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
2,132	Thompson, Henry G., assignor to the Hartford Carpet Company.	New York, N. Y.	Carpet pattern. (Design)	July 4, 1865.
47,469	Thompson, Hopkins	New York, N. Y.	Chair, reclining	Apr. 25, 1865.
46,404	Thompson, I.	New York, N. Y.	Cigar machine	Feb. 14, 1865.
50,645	Thompson, James	Vevry, Ind	Churns	Oct. 23, 1865.
51,281	Thompson, James H.	England	Gun barrels, &c., from Bessemer steel, process of making	Nov. 23, 1865.
48,326	Thompson, Jesse G.	Hoboken, N. J.	Grain huller	June 24, 1865.
46,734	Thompson, J. M., and S. D. Tripp, assignors to Seth D. Tripp	Carbondale, Pa.	Barrels, oil, and for other purposes, composition for coating	Mar. 7, 1865.
46,761	Thompson, John S.	Stoneham, Mass.	Heel polishing machine.	Mar. 7, 1865.
49,330	Thompson, Leander, and Andrew P. Jackson. (See Jackson & Thompson.)	Lynn, Mass.	Stave machines	Aug. 8, 1865.
51,270	Thompson, M. L., assignor to self and E. L. Childs.	Brooklyn, N. Y.	Clothes, bed, retainers, children's. (Antedated Nov. 20, 1865)	Nov. 23, 1865.
47,779	Thompson, Nathan	England	Jars, bottles, &c., stopper for. (Patented in England Jan. 4, 1865)	May 16, 1865.
50,856	Thompson, Nathaniel S., and A. S. McIntire. (See McIntire & Thompson.)	Stoneham, Mass.	Shoe-edge burnishing machine	Nov. 7, 1865.
50,515	Thompson, William A.	Brooklyn, N. Y.	Stoves, gas, burner for	Oct. 17, 1865.
46,735	Thorn, Sardis	Monterey, Mass.	Cheese, machine for cutting the curd of.	Mar. 7, 1865.
46,599	Thorn, Barclay, and Eli Keith. (See Keith & Thorn.)	Clinton Junction, Wis.	Jack, lifting	Feb. 23, 1865.
47,072	Thornton, William M. K.	Providence, R. I.	Engines, steam, valves for	Mar. 23, 1865.
46,832	Thorpe, James E., assignor to self and Francis D. Kidder	New York, N. Y.	Knife and fork, combined	Mar. 14, 1865.
47,999	Thorpe, T. B.	New York, N. Y.	Exercising machine	May 30, 1865.
47,140	Thurmon, John	Pike county, Mo.	Medical compound	Apr. 4, 1865.

47, 280	Thurston, Edwin, and James R. Ledyard.	Covington, Ky.	Cur trucks.	May 23, 1865.
51, 631	Thurston, E. M., and J. W. Penney. (See Penney & Thurston.) Thurston, Samuel D. Tibbals, Shirk & Whitehead. (See Vedder, Nicholas S., assignor.) Design	Somerville, Ohio.	Broom head.	Dec. 19, 1865.
51, 943	Tibbals, William.	South Coventry, Conn.	Fire-arms, breech-loading.	Nov. 23, 1865.
48, 114	Tibbets, Jonathan S., and W. M. Merriell.	Jeffersonville, Ind.	Vehicles, wheel, axles for.	June 6, 1865.
47, 983	Tibbets, Milbern.	Lancaster, Ind.	Sugar pumps, apparatus for shifting.	May 2, 1865.
48, 741	Tibbitts, Jonathan H.	Omaha City, Neb. Ter	Piano-forte actions.	July 11, 1865.
46, 405	Tice, Isaac P.	New York, N. Y.	Twine, paper, mode of manufacturing.	Feb. 14, 1865.
	Tice, Isaac P. (See Smith, Anstin S., assignor.) Reissue.			
	Tilden, H. G., and Wiley J. Stratton. (See Stratton & Tilden.)			
49, 011	Tiffany, George S.	Palmyra, Mich	Measures, board.	July 25, 1865.
49, 019	Tilden, Henry H.	New Lebanon, N. Y.	Sirup from corn, manufacture of.	July 25, 1865.
49, 013	Tilden, Henry H.	New Lebanon, N. Y.	Filtering sirups and other liquids, apparatus for.	July 25, 1865.
47, 050	Tilden, Howard.	New York, N. Y.	Sifter, flour.	July 28, 1865.
47, 756	Tilden, Howard.	New York, N. Y.	Sifter, flour.	May 16, 1865.
48, 323	Tilden, Howard.	Boston, Mass.	Sifter, flour.	June 13, 1865.
49, 176	Tilden, Howard.	Boston, Mass.	Egg-beater.	Aug. 1, 1865.
2, 106	Tilden, Howard.	Boston, Mass.	Sifter, flour.	Nov. 14, 1865.
	Tilden, Howard. (See Johnson, John, assignor.)			
49, 200	Tilgston, George W., assignor to Asa Wilnot.	New Haven, Conn.	Sifter, flour.	Aug. 1, 1865.
49, 664	Tilton, Frederick W.	Bristol Station, Ill.	Sirup, &c., apparatus for cooling.	Aug. 29, 1865.
50, 968	Tilton, George F.	Salem, Mass.	Clothes-dryer. (Antedated November 1, 1865)	Nov. 14, 1865.
47, 584	Tilton, J. C. (See Andrews, Joseph K., assignor.)			
47, 584	Tinley, Theodore R.	Saratoga Springs, N. Y.	Timepieces, globe.	May 2, 1865.
1, 994	Tinker, Charles, and J. H. Sprague, assignors to Edwin Jones.	Cleveland, Ohio.	Clocks, globe.	May 2, 1865.
31, 394	Tinker, John B.	Buffalo, N. Y.	Harvesters. (Reissue).	May 23, 1865.
50, 358	Tittle, Daniel J.	Albany, N. Y.	Mowing machines.	Dec. 5, 1865.
49, 321	Titus, Addison R.	Warren, Pa.	Pill machines.	Oct. 3, 1865.
	Tobacco Pipe Company. (See Bowen, Andrew J., assignor.) Re-issue.		Stand, milk.	Aug. 8, 1865.
46, 455	Todd, A. W.	Chicago, Ill.	Sewing-machine bobbins, machine for winding.	Mar. 31, 1865.
48, 553	Todd, A. W.	Chicago, Ill.	Pumps, steam.	July 18, 1865.
47, 670	Todd, Joseph S.	Macon City, Mo.	Stove, coal, air-tight.	May 9, 1865.
59, 651	Todd, William W., and John Vandercar.	Brooklyn, N. Y.	Car brakes.	Sept. 19, 1865.
47, 586	Toff, James. (See Seitz, Louis, assignor.)	Chicago, Ill.	Shells, explosive, by clockwork, timing.	May 2, 1865.
46, 436	Tolhurst, George W.	Cireleville, Ohio.	Map.	Feb. 14, 1865.
45, 467	Toll, Charles, et al. (See Custer, George, assignor.)			
45, 771	Tomb, Asa M.	Lyons, N. Y.	Marble, machine for polishing.	Feb. 14, 1865.
59, 780	Tonkins, Joseph F.	New York, N. Y.	Barrel heads, method of securing. (Antedated Nov. 24, 1861).	Jan. 3, 1865.
45, 603	Tonkinson, Abraham, assignor to self and Charles C. Clements.	Cincinnati, Ohio.	Blacking.	Oct. 31, 1865.
45, 595	Tonkinson, James.	Newburg, Wis.	Separator, grain.	July 4, 1865.
	Tonkinson, C. R.	Rochester, N. Y.	Barrel heads, machine for cutting.	Feb. 21, 1865.
45, 880	Tompson, Charles. (See Bradford, George S., assignor.) Tompson, John W., Stephen S., and James. (See Price, James, assignor.)	Newark, N. J.	Saddletrees, harness.	Jan. 10, 1865.

List of patentees of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
47, 671	Toof, E. J.	Fort Madison, Iowa.	Elevators, hay.	May 9, 1865.
51, 632	Toof, Edwin J.	Fort Madison, Iowa.	Draught equalizer, three-horse.	Dec. 19, 1865.
48, 742	Tooker, A. W.	Harvard, Ill.	Hay elevator and stacker.	July 11, 1865.

49, 201	Wendell, Isaac P., and Stephen Usick, assignors to Isaac P. Wendell.	Albany, N. Y.	Paint, composition for.	Aug. 8, 1865.
49, 201	Wendron, James G., assignor to Wheeler, Mellick & Co. and E. Wackerhagen.	New York, N. Y.	Spoon handle.	Sept. 12, 1865.
48, 655	Wendt, Rudolph.	New York, N. Y.	Spoon handle.	July 18, 1865.
47, 673	Wenger, Henry.	Pennersville, Pa.	Water wheels.	May 9, 1865.
49, 327	Wenzel, Theodore, and Charles. (See Beckman, A., assignor.)	New Brunswick, N. J.	Sewing machines, means for carrying and operating the shuttles in.	Aug. 8, 1865.
49, 191	Werner, John, Jr.	Padre du Sac, Wis.	Boiler tubes, tool for sealing. (Antedated July 26, 1865.)	Sept. 26, 1865.
45, 779	Werner, John, Jr.	Prairie du Sac, Wis.	Harvesting machines.	Jan. 3, 1865.
48, 468	Werns, P.	Manchesdor, Mich.	Motion, converting rotary into reciprocating.	June 27, 1865.
50, 526	Wesman, P.	Berlin, Ohio	Stave machines.	Oct. 17, 1865.
47, 144	Wesson, D. B., and H. Smith. (See Smith & Wesson.)	Chillicothe, Ohio.	Vinegar, apparatus for making.	Apr. 4, 1865.
49, 575	West, Amos.	Pontiac, Mich.	Musical instruments, electro-magnetic.	Aug. 22, 1865.
49, 048	West, Hiram E., assignor to Oliver Carpenter.	Attleboro', Mass.	Sawing, working power for.	July 25, 1865.
49, 049	West, Hiram E., assignor to Ernestus P. Carpenter.	Attleboro', Mass.	Hats and bonnets, machine for pressing.	July 25, 1865.
45, 780	West, John B.	New York, N. Y.	Banquets and hats, apparatus for making.	Jan. 3, 1865.
48, 469	West, J. L., and J. O., et al. (See Rugg, Datus E., assignor.)	Washington, Ohio.	Garment measuring. (Antedated September 8, 1862.)	June 27, 1865.
49, 942	West, J. L., and J. O. (See Burnham, Oliver R., assignor.)	Cambridge, Mass.	Churns.	Sept. 12, 1865.
47, 143	West, Josiah M.	Roxbury, Mass.	Carrriages, railway.	Apr. 4, 1865.
46, 738	West, True, and Elias H. Dorby. (See Dorby & West.)	New York, N. Y.	Planter, corp.	Mar. 7, 1865.
46, 739	Westbrook, C. L.	Syracuse, N. Y.	Churns.	Mar. 7, 1865.
46, 710	Westcott, Amos.	Syracuse, N. Y.	Bolts for doors.	Mar. 7, 1865.
47, 885	Westcott, Amos.	Syracuse, N. Y.	Cranks to machinery, attaching.	May 23, 1865.
48, 856	Westcott, Amos.	Syracuse, N. Y.	Pastometer, such.	July 18, 1865.
47, 145	Westcott, Henry P.	Southern Falls, N. Y.	Churns.	Apr. 4, 1865.
48, 878	Westcott, Nathaniel W., and Westcott, Henry L., assignors to James G. Payson.	Providence, R. I.	Knitting shoe linings, &c., machines for.	July 18, 1865.

[illegible]

List of patents of inventions, designs, and reissues, 1865—Continued.

No.	Patentee.	Residence.	Invention or discovery.	Date.
47, 479	Wheeler, Norman W.	Brooklyn, N. Y.	Boats, ferry, trainway for	Apr. 25, 1865.
47, 480	Wheeler, Norman W.	Brooklyn, N. Y.	Condensers, tubular	Apr. 25, 1865.
47, 481	Wheeler, Norman W.	Brooklyn, N. Y.	Berths, movable	Apr. 25, 1865.
47, 482	Wheeler, Norman W.	Brooklyn, N. Y.	Boats, steam, and other vessels, landing platform for	Apr. 25, 1865.
51, 239	Wheeler, Russell, and Stephen A. Bailey.	Brooklyn, N. Y.	Pile elements	Nov. 23, 1865.
2, 138	Wheeler, S. H., assignor to self, R. Hedden, C. T. Lee, A. G. Townsend, D. Henderson, J. T. Stillwell, T. J. Martin, and J. Sullivan.	Utica, N. Y.	Stove, cook	Aug. 1, 1865.
48, 778	Wheeler, S. H., assignor to self, A. G. Townsend, J. Stillwell, R. Hedden, E. P. Townsend, C. T. Lee, and J. Sullivan.	Dowagiac, Mich.	Faucets, measuring	July 11, 1865.
50, 210	Wheeler, Thomas B., deceased, by Rebecca C. Wheeler, administratrix.	Dowagiac, Mich.	Hay forks, horse	Sept. 26, 1865.
45, 783	Wheeler, William	Albany, N. Y.	Sieves, grain	Nov. 29, 1865.
47, 080	Wheeler, William A.	Poultney, Vt.	Stove	Jan. 3, 1865.
49, 338	Wheeler, W. P.	New York, N. Y.	Ink-stand, fountain, operating parts of a	Mar. 28, 1865.
50, 761	Wheeler, Zenas	Louisville, Ky.	Evaporating and distilling apparatus	Aug. 8, 1865.
51, 637	Wheeler, Zenas, and Phineas M. Randall.	San Francisco, Cal.	Shafts, fastening wheels and pulleys to	Oct. 31, 1865.
46, 741	Wheeler, Jay	San Francisco, Cal.	Mill, quartz-grinding	Dec. 19, 1865.
51, 250	Wheeler, Jerome	San Francisco, Cal.	Trap, animal	Mar. 7, 1865.
47, 248	Wheeler, Luke, assignor to self and O. B. Leavenworth.	Worcester, Mass.	Piston, packing	Nov. 23, 1865.
49, 943	Whelpley, James D.	New Haven, Conn.	Syringes	Apr. 11, 1865.
48, 226	Whelpley, J. D., and Jacob J. Storer	Boston, Mass.	Fertilizer	Sept. 12, 1865.
49, 187	Whelpley, J. D., and Jacob J. Storer	Boston, Mass.	Metals from ores, apparatus for separating	June 13, 1865.
50, 975	Whelpley, J. D., and Jacob J. Storer	Boston, Mass.	Mills, stamping and crushing	Aug. 1, 1865.
50, 976	Whelpley, J. D., and Jacob J. Storer	Boston, Mass.	Quartz crushers	Nov. 14, 1865.
50, 647	Whipple, H. J. P., and John E. Parker. (See Cinquine, Pietro, assignor.)	Boston, Mass.	Steel, cast, or cast iron, with wrought or cast-iron surfaces, processes for uniting	Nov. 14, 1865.
1, 881	Whipple, Milton D.	Boston, Mass.	File-cutting machines	Oct. 24, 1865.
48, 753	Whipple, M. D., assignor through mesne assignments to the Whipple File Manufacturing Company.	Cambridge, Mass.	Files, machines for cutting	Feb. 21, 1865.
47, 238	Whittaker, Daniel	Roxbury, Mass.	Soap frames, construction of	July 11, 1865.
50, 291	Whitcomb, James O.	Philadelphia, Pa.	Jars, fruit, stopper for	Apr. 11, 1865.
47, 350	White, Albert M.	New York, N. Y.	Dental operating machines	Oct. 3, 1865.
47, 157	White, Albert M., assignor to self and Barnard Lavery	Port Chester, N. Y.	Fire-arms, breech-loading	Apr. 18, 1865.
49, 329	White, Ambrose J.	Port Chester, N. Y.	Brush	Apr. 4, 1865.
46, 039	White, Benjamin C.	New York, N. Y.	Gas retorts, method of removing incrustation from	Aug. 8, 1865.
46, 287	White, B. C., et al. (See Verge, H. W., assignor.)	Richmond, Ind.	Mills, tanning	Jan. 24, 1865.
49, 208	White, George W.	New York, N. Y.	Ores, apparatus for calcining	Feb. 7, 1865.
47, 146	White, James	Cleveland, Ohio	Wrench	Aug. 1, 1865.
49, 815	White, Joseph F.	Keene, N. H.	Pumps	Apr. 4, 1865.
46, 411	White, Joseph P.	New York, N. Y.	Presses, baling	Sept. 3, 1865.
46, 411	White, Martin V. B.	Troy, N. Y.	Cartridge box	Feb. 14, 1865.
49, 944	White, Orsamus A., and J. W. Bostwick.	Norwalk, Ohio	Horse-power for sawing machines	Sept. 12, 1865.

50, 292	White, Orsamus A., and J. W. Bostwick.....	Norwalk, Ohio.....	Sawing machines.....	Oct. 3, 1865.
48, 610	White, Peregrine.....	Dixmont Centre, Me.....	Buckle.....	July 4, 1865.

DESCRIPTIONS AND CLAIMS OF PATENTS

ISSUED IN THE YEAR 1865.

ILLUSTRATED WITH ENGRAVINGS.

No. 45,685.—E. H. ASHCROFT, Lynn, Mass.—*Steam Pressure Gauge*.—January 3, 1865.—This invention consists in making the disks of steam pressure gauges by the process of spinning, instead of striking them up out of sheet brass as usual. The circular plate which is to constitute the spring is confined to a chuck, the face of which is wrought into a series of concentric elevations and depressions conformable to the undulations which it is desired to be given to the disk, and the chuck being caused to rotate, a tool is pressed against the disk, and carried backward and forward across it until it has assumed the shape of the face of the chuck. The disk is then removed from this chuck, and placed upon another with its other face exposed to the action of the tool.

Claim.—A corrugated disk spring, hardened or tempered, substantially as set forth.

No. 45,686.—HENRY S. BABCOCK and S. H. JENKS, Ionia, Mich.—*Plaster and Seed Sower and Roller Combined*.—January 3, 1865.—In this machine the plaster box is open the whole length, the bottom being formed of an adjustable plate. A vibrating rod with teeth is caused to agitate the plaster in the box to prevent clogging. The seeding apparatus is of ordinary construction, and used in combination with a roller to smooth the ground.

Claim.—The plaster box fourteen having an unobstructed opening extending the whole length, the adjustable bottom plate thirteen, and toothed reciprocating bar twelve, in combination with the seed-sowing device and land roller, the several parts being constructed and arranged, substantially as and for the purpose set forth.

No. 45,687.—IRA BARBER, jr., La Porte, Ind.—*Cultivator*.—January 3, 1865.—In this invention the forward ends of the plough beams are fastened in a forked pivot, and the rear ends are suspended by chains, enabling the operator to give a lateral motion of his foot.

Claim.—First, the pivots *c*, pivoted with the pronged or forked ends, and arranged as shown in relation to the beam *c* and frame *O'*, in combination with the plough beams *L*, operating as and for the purposes herein shown and set forth.

Second, suspending the rear ends of the plough beams *L* by the chains *d*, in combination with the pivoted front end of said beams, for the purpose of enabling the operator to give the shovels the lateral motion, substantially as and for the purposes herein specified.

No. 45,688.—S. S. BENT, New York, N. Y.—*Combined Register and Summer Piece*.—January 3, 1865.—This invention consists in providing an ornamental summer piece with movable plates at the back, whereby it can be used as a register in winter, and a ventilator for summer.

Claim.—The combined register and summer piece for grate frames, constructed substantially as specified.

No. 45,689.—S. E. BLAKE, Worcester, Mass.—*Bread and Vegetable Slicer*.—January 3, 1865.—This invention is explained by the claim and engravings.

Claim.—The combination of the eccentric slicer *G*, adjustable feed box, feed block *N*, and rack *O*, when constructed and operated substantially as and for the purposes described.

Also, the combination of the adjustable cam *P*, with lever *Q*, pawl *R*, rack *O*, and springs *h S*, for the purpose of adjusting the length of the feed, substantially in the manner herein described.

Also, the combination of the lever *Q*, pawl *R*, rack *O*, and rod *U*, for the purpose of disengaging the pawl from the ratchet, substantially as herein described.

Also, in combination with the revolving eccentric slicer *G*, feed box and feed, the protecting shield *K*, substantially as and for the purposes described.

Also, the combination of the revolving slicer, adjustable feed box, and adjustable feed, when the several devices are constructed and arranged substantially as and for the purposes described.

No. 45,690.—T. S. BLAKE and O. E. MOSHER, New York, N. Y.—*Refrigerator*.—January 3, 1865; antedated February 12, 1864.—A rectangular box provided with double walls having any suitable non-conducting substance between, contains in its upper part an inclined rack for holding ice, beneath which is a trough for carrying off water coming from the ice. The air entering the refrigerator from the outside first passes over the trough, the water in which being colder than the air, reduces its temperature somewhat before it comes in contact with the ice in the rack. Thus the waste water is made available as a cooling medium.

Claim.—The arrangement of the air chamber *d*, rack *c*, and conducting plate *D'*, with the bottom *D*, water trough and plate *E*, and box *A*, all in the manner herein shown and described.

No. 45,691.—C. F. BLAKESLEE, New York, N. Y.—*Arms for Dolls*.—January 3, 1865.—The arms are made by cutting them from a single piece of leather, so that they may be folded upon themselves and glued without the necessity of stuffing the fingers or stitching the edges as heretofore.

Claim.—As an improved article of manufacture an arm for dolls constructed by stamping or cutting out of leather of suitable thickness, with the fingers and adjacent part of the hand completely cemented together so as to have the necessary form and rigidity without stuffing, all as herein described.

No. 45,692.—H. F. BOND, Waltham, Mass.—*Device for Trimming Lamp Wicks*.—January 3, 1865.—This device consists in the combination of two lever handles connected together by a rivet, to one of which is attached a frame carrying a cutter knife operating against a head plate and returned by two spiral springs, and the other having a cross bar, which by compression of the handles operates the said frame and knife.

Claim.—The lamp-trimming device, constructed and operated as herein set forth.

No. 45,693.—A. H. BRAINARD, Dorchester, Mass.—*Vice*.—January 3, 1865.—This invention relates to the bed-plate, to which is attached the stationary jaw, and it consists in forming grooves both upon the sides and in the bottom, that in the latter being T-shaped and forming a hold or support for the head of the bolt, which secures the vice in position and on which it traverses, the ones on the sides forming guides and supports for the tongues of the movable jaw.

Claim.—Constructing the bed-plate of the stationary jaw with grooves both upon the outside and inside, the outer grooves receiving the tongues of the movable jaw, which is thus guided and supported, the inner groove receiving and affording a firm hold for a bolt, which secures the vice in position and also allows it to revolve upon a changeable centre or to slide to and fro, substantially as described.

Also, the nut *g*, substantially as described.

No. 45,694.—JOHN BROUGHTON, New York, N. Y.—*Lubricator*.—January 3, 1865.—The object of this invention is to so combine and arrange parts that an independent detachable reservoir of glass or other transparent material may be used without danger of fracture from expansion or contraction, and thus to combine the advantages of a transparent lubricator or cup, with a graduating feed. Its novelty consists in the combination and arrangement of a cap and spindle with a detachable reservoir, so that the shank and spindle, with the cap, may be firmly held together independently of the reservoir, and allow it to expand and contract independently of the connection between the shank and cap.

Claim.—First, the arrangement of the shank and spindle *Bj*, and cap *C*, in combination with a detachable reservoir, substantially as described.

Second, combining and arranging the detachable reservoir, the shank and spindle *Bj*, and cap *C*, in such a manner that the said shank and cap are held firmly and rigidly together independently of the reservoir, said reservoir being free to contract and expand independently of the connection between the shank and cap, substantially as described.

No. 45,695.—ISRAEL F. BROWN, New London, Conn.—*Roller for Cotton Gins*.—January 3, 1865.—In roller gins, when a bunch or wad of cotton tangled or matted presents itself to be drawn through between the roller and breast plate, the wad causes the latter to be forced away from the roller in order to open a passage for itself, thereby permanently bending the plate and subjecting it to injury from the stripper. The object of this invention is to prevent this.

Claim.—First, making the drawing-in or working roller of a roller cotton gin with a surface partly solid and partly elastic, substantially as described.

Second, putting elastic bands or rings around the roller of a roller gin in parallel and in continuous or in interrupted lines, substantially as described.

No. 45,696.—ANDREW BUCHANAN, Brooklyn, N. Y.—*Car Spring*.—January 3, 1865.—This invention consists of a spring composed of two arms, each of which is supported at two or more points by blocks of India-rubber or by springs of any other suitable material, in such a manner that the said blocks or springs form a yielding fulcrum for the arms, and also in the application of toggle arms connecting the ends of the arms which are supported by the springs, and the spring to be adjusted by a screw.

Claim.—First, a spring for cars or other vehicles composed of two arms, each of which is supported at two or more points by blocks of India-rubber or other equivalent material, substantially in the manner and for the purpose herein shown and described.

Second, the set screw *f*, in combination with the block *a* or its equivalent, and with the arms *A A*, constructed and operating in the manner and for the purpose substantially as set forth.

Third, the toggle arms *C C* applied in combination with the arms *A A*, and springs *a b b*, in the manner and for the purpose substantially as specified.

No. 45,697.—JACOB BUSSEY, Philadelphia, Penn.—*Propeller.*—January 3, 1865.—A strong framework of iron or other suitable material is constructed so as to be easily let into a bed made to receive it, said bed being attached to and projecting from the sides of the vessel, all the working or propelling parts, when in place, being under water. The said frame moves backward and forward in guides, the paddles being raised and lowered by the action of the water upon them in the backward and forward motion.

Claim.—The arrangement of the guides, frame, paddles, stays, and levers, the whole being arranged to operate as herein set forth and for the purposes herein specified.

No. 45,698.—HERMAN CAMP, San Francisco, Cal.—*Quartz Crusher.*—January 3, 1865; antedated September 17, 1864.—Within a cylinder of any desired dimensions and of any suitable material is placed a roller or crusher, or a series of dies composing such roller or crusher when bolted together, said roller being provided with interstices for the purpose of transmitting the substance to be crushed from its back to its front, while in motion. The cylinder is lined on the inside with a series of chilled-iron staves, and runs upon friction rollers.

Claim.—The combination of the cylinder *A* and its peculiarly constructed head piece *B*, with the dies constructed of a series of sections of cast iron as shown in figures 3, 4, and 5, supported and revolving upon friction wheels, the whole made, constructed, and operating in the manner and for the purpose herein described.

No. 45,699.—LEWIS R. CARPENTER, Lancaster, Ohio.—*Carriage Brake.*—January 3, 1865; antedated August 19, 1862.—A horizontal lever provided with a roller is attached to the carriage; said roller traverses a bar, which when the carriage begins to descend a hill is inclined so that the roller runs down it and automatically operates the devices which apply the brake. When the carriage passes upon a level or commences to ascend a hill, the roller runs back on the bar and releases the brake.

Claim.—Arranging the lever *R* horizontally, and making the weight upon it roll or traverse on a bar, substantially as described for the purpose specified.

Also, in combination with the lever *R*, and weight or roller *S*, the link *W*, lever *N*, and shaft *L*, and roller *X*, substantially as described.

No. 45,700.—A. B. CASS, Chicago, Ill.—*Cultivator.*—January 3, 1865.—This invention consists of a seat arranged upon one end of a lever and furnished with rollers to facilitate its movements. The lever extends over the draught pole, and is connected to it at its front end by a rod passing through a lip. Just in front of the seat is a cross-bar with a series of holes, through which pass rods fastened firmly to the plough standards. The ploughs may be thus gauged to run at any desired distance from each other, and by a motion of the seat, be moved laterally to conform to irregularities on the rows. At the forward end of the seat lever is a horizontal bar, along which runs an iron rod, furnished at its centre with a vertical bow, and at its ends with small bars or levers connected with scrapers, running in front of the wheels.

Claim.—First, the combination of the adjustable lever *A*, bar *a*, levers *b*, and ploughs *M*, arranged and operating substantially as and for the purposes set forth and shown.

Second, attaching the scrapers *J* to the axle, by one or more arms *K*, substantially as and for the purposes shown and set forth.

Third, the combination of the adjustable lever *A* with the rod *L*, provided with the arms *I* or their equivalent, and the chains *h* operating as and for the purposes shown and specified.

Fourth, the employment of one or more rollers *H* to facilitate the lateral motion of the lever *A*, operating substantially as shown and described.

Fifth, the employment of the roller *I* in combination with the lever *A*, arranged and operating substantially as and for the purposes herein shown and specified.

No. 45,701.—FRANCIS CLARK, Auburn, Mass.—*Breech-loading Fire-arm.*—January 3, 1865.—This invention consists in the application to a breech-loading fire-arm of a spring cartridge retractor, provided with a hook or catch for engaging with a pin on the hammer, so as to be operated by the same on cocking the arm, and having a projecting rod or arm extending forward so as to be also operated by hand if desired.

Claim.—First, the combination of the hammer *G*, cartridge extractor *b*, hook *m*, and retaining spring *h*, substantially in the manner and for the purposes herein described.

Second, the combination of the cartridge extractor as herein described with the extended arm *g*, so that it can be operated either from the front by means of said arm, or from the rear by means of the hammer, substantially as herein described.

Third, the application to the hammer of the regulating screw *3*, in combination with the cartridge extractor, substantially as and for the purposes described.

No. 45,702.—G. H. CLEMENS, U. S. A.—*Saw-mills*.—January 3, 1865.—This invention consists in providing on the head block a hinged knee, which turns down out of the way when a log is rolled upon the head block, so that a log can be rolled on from either side. The carriage is supported upon pedestals so arranged that the wheels under them can be adjusted to an angle with the carriage track, so that the carriage shall run steady and not tend to spring the log in the operation of sawing.

Claim.—First, the hinged knee adapted to be turned down out of the way, in the manner and for the purposes herein specified.

Second, the provision of supporting wheels or rollers F, set or capable of being set obliquely to the track, substantially as and for the objects set forth.

Third, the wheels F journaled in pedestals G, susceptible of angular adjustments beneath the carriage, as represented.

No. 45,703.—M. C. DAVIS, Guilford, Ohio.—*Machine for Shearing Sheep*.—January 3, 1865.—This invention consists in forming a bar in four sections, each section being connected together by swivel joints in connection with a smaller bar to which the shears are connected, and provided with pulleys and cords whereby the shears are operated at right angles by the same.

Claim.—First, two bars J J' formed each of two parts $g g'$, connected together by swivel joints $h h$, and the bars connected by a joint I, which admits of them working in a direction at right angles with each other, in combination with the bar K to which the shears are attached, said bar being connected to the bar J' by joint M, similar to I, and all arranged substantially as and for the purpose specified.

Second, the shears composed of the fixed cutters $o o$, and the vibrating knife Q attached to the outer or front end of bar K, the knife being operated from the shaft B through the medium of the pulleys F H N, cords or bolts G O, crank p , connecting rod R, and arm q , all arranged substantially as set forth.

No. 45,704.—JAMES B. EADS, St. Louis, Mo.—*Mounting and Operating Ordnance*.—January 3, 1865.—The gun is mounted on a carriage or frame capable of being raised by steam or other power, and the improvement consists in the arrangement and connection of side steam-cylinders, whose piston rods operate, by means of toothed racks, upon toothed segment gears, with their rock shafts and arms, for the purpose mentioned. The invention also consists in the employment of an adjustable hand-capstan, having a worm gear upon its shaft, and capable of being thrown into and out of gear with the said elevating devices, so that the guns may be worked by manual power if desired.

Claim.—First, the employment of the cylinders E E, in combination with the racks $fff' f'$, gears $g g g' g'$, and arms $h' h' h' h'$, or their substantial equivalents in effect, all being constructed and arranged to operate substantially as and for the purpose herein set forth.

Second, in combination with the other operative mechanical device operating the frame H, the adjustable capstan R, substantially as and for the purpose set forth.

No. 45,705.—WILLIAM FENSTERMACHER, Shippensburg, Penn.—*Clod Crusher*.—January 3, 1865; antedated March 7, 1864.—A wooden cylinder of suitable size is provided with metallic blades running lengthwise of it. The cylinder being drawn over the surface of a harrowed field, either before or after sowing or planting, the blades crush and open the clods and dry lumps of the soil. A smoothing roller follows, which rolls and smooths down the soil thus broken up.

Claim.—The combination with the main frame A and arms or hangers C C and C' C' of the cylinder E, provided with blades G, and the rear smooth roller D, said parts being arranged and operating in relation to each other as and for the purposes set forth.

No. 45,706.—ELISHA FITZGERALD, New York, N. Y.—*Apparatus for Aerating Dough*.—January 3, 1865.—This invention consists in giving the dough an additional charge of carbonic acid after it has been mixed. The gas for supercharging is contained in a receiver, and by means of a pipe meets the dough in the passage as it is discharged from the mixer.

Claim.—First, supercharging the dough, already aerated in the mixing receiver, by forcing air or gas into it in the passage K, at the time the faucet is opened to permit the exit of the dough.

Second, forcing a jet of air or gas into the passage K at the time the dough is being expelled from the mixing receiver.

Third, admitting the air or gas under pressure to come in contact and be infused in the dough in its passage out.

No. 45,707.—JOHN M. FOLLETT, Atkinson, Ill.—*Seeding Machine*.—January 3, 1865; antedated May 14, 1862.—This machine consists of a combination of colters for cutting stubble, of ploughs for opening and properly preparing the earth for the seed, and of a seeder for sowing seeds of various kinds; the seed stopper, slides, and ploughs being so connected that the distribution of the seed may be stopped and the ploughs elevated simultaneously by a simple manipulation of the driver.

Claim.—The combination of the stopper slides F, bar G, and plough and colter frame, composed of the parallel bars I, with the bars *l m* attached, the slides F and plough and colter frame being connected to the bar G', and all arranged as shown, to operate as set forth.

No. 45,708.—JOHN W. FOSTER, Washington, D. C.—*Cancelling Stamp*.—January 3, 1865.—This invention consists of an adjustable gauge-punch, and annular cutter, made also adjustable, and a peculiar arrangement of set screws, by which the letters on the face of the stamp can be easily changed.

Claim.—First, a cancelling stamp, provided with an annular cutter C, and an internal gauge B, either one or both adjustable in relation to each other, substantially as and for the purposes set forth.

Second, the combination of the double set screws E F with the cutter C and gauge B, for the purpose specified.

No. 45,709.—T. E. GORDON, Brooklyn, Ohio.—*Crutch*.—January 3, 1865.—This invention consists in a method of adjusting a movable point in the bottom of the crutch, which can be raised up or pressed down by the cross-piece, and held firmly in either position by turning up or down respectively; the side crutches hinged to each side of the cross-piece. The India-rubber spring aids in keeping the catches in position.

Claim.—The finger *g*, stops *g'*, and springs *n*, in combination with the tube *h* and crutch, when arranged and operating conjointly, as herein set forth.

No. 45,710.—HENRY C. GRIGGS, Waterbury, Conn.—*Picture Medals, Buttons, &c.*—January 3, 1865.—This device is composed of two disks or pieces of metal, enclosing a perforated ring, made to hold the pictures back to back. A loop pressed in the edge of one of the disks serves to support the frame.

Claim.—The countersunk or perforated ring *b*, in combination with the shell *a*, for securing the picture in the manner specified.

Also, a loop upon the edge of the shell, formed substantially as specified.

No. 45,711.—G. E. HARDING, Bath, Maine.—*Press*.—January 3, 1865.—This invention relates to a press in which two toggle levers are connected to a strap hinged to the frame and to the follower, and operated by a windlass. The rope from the windlass extends over pulleys in the outer or loose ends of the toggle levers, and along the upper edges of said levers through loops or under sheaves near their fulcrums, up over sheaves fixed to the frame, and down to straps secured to the rod which forms the movable fulcrum of said toggle levers, in such a manner that a strain on the rope has a tendency to raise the follower and the inner ends of the toggle arms, and at the same time to draw their loose ends together, and the follower is exposed to a powerful upward pressure.

Claim.—The toggle levers F, having their fulcrums on pivots projecting from the ends of the follower, and applied in combination with straps G, and with a rope or chain extending from a windlass over pulleys in the loose ends of said levers, and through loops or pulleys attached to said levers near their fulcrums, thence over pulleys fixed to the frame, and down to the fulcrum pins of the levers, substantially in the manner and for the purpose set forth.

Also, the straps G, hinged at one of their ends to the frame A, and at their opposite ends to the loose ends of the levers F, in combination with said levers and with the follower and windlass, constructed and operating substantially as and for the purpose described.

No. 45,712.—DANIEL C. HELLER, Reading, Penn.—*Shutter Bolt*.—January 3, 1865.—This invention is designed as an improvement on a bolt patented to the said Heller July 5, 1864, and consists in forming the circular inclines on the case of the bolt, instead of on the button, as in this instance referred to; otherwise the construction and operation of the two are substantially the same.

Claim.—The revolving button C or C', bearing against inclined planes *d* or *d'*, cast on the case of the bolt, or on a bridge placed over the same, and having its shank or pivot rivetted in a sleeve D or D', through which the bolt B or B' passes, all arranged substantially as and for the purpose herein set forth.

No. 45,713.—D. H. HISE, Salem, Ohio.—*Railway Coupling*.—January 3, 1865.—The object of this invention is to obtain a coupling for railway rails which will hold the ends of the same in line with each other, so as to avoid the injury now occasioned by the hammering of the car wheels against the projecting ends of the rail, by which the rails are soon injured, and their removal for repair rendered necessary long before any other portion thereof is materially worn.

Claim.—The two bars B B', one, B, provided with the key bolts C C, and the other provided with holes, through which and holes in the rails the key bolts or tangs pass, in connection with the keys D D, all arranged substantially as and for the purpose specified.

No. 45,714.—HENRY HISE, Ottawa, Ill.—*Snap-hook*.—January 3, 1865.—This invention relates to a snap-hook of that class which are provided with a snap and spring to close the

hook and prevent it from becoming casually detached from the article with which it is engaged, and at the same time admit of the article being readily engaged with, or fitted into, the hook, and disengaged from it when required.

Claim.—A new article of manufacture, the snap-hook, constructed and operating in the particular manner herein specified.

No. 45,715.—ERASTUS HOLT, Wheaton, Ill.—*Self-loading Hay Cart.*—January 3, 1865.—Two arms, one on each side, are pivoted to the lower part of the front end of the body, to which the rake-head or bar is attached by pivots. Above the rake-head a shaft is pivoted to arms firmly secured to the upper part of the sides of the body, which shaft is connected with the rake-head by chains and is rotated by a lever, thereby raising or lowering the rake. To the front ends of the upper arms is pivoted another bar, to which the draught pole is attached, and to the end of said draught pole a curved arm is attached, extending backward toward the body. A bar loosely clasping the rotating shaft is attached to the curved arm by a pin passing through holes in its upper end, thereby furnishing means for tilting the body.

Claim.—The rake N, having its bar O, provided between arms P P, which are attached by pivots to the sides of the body A of the cart, in combination with the shaft F, cords or chains h h, lever K, and the arm I, or its equivalent, all arranged substantially as and for the purpose herein set forth.

Also, the bar G pivoted between the arms E E at the sides of the front end of the cart body, in combination with the arm I at the rear of the draught pole H, and the bar J attached to shaft F, all being arranged to operate in the manner substantially as and for the purpose specified.

No. 45,716.—M. R. HOWELL, Elizabeth, N. J.—*Mouldier's Sprue.*—January 3, 1865.—The claim in this case sets forth the nature of the invention.

Claim.—A moulding sprue constructed with concave sides and curved ends, as a new article of manufacture.

No. 45,717.—J. T. P. HUNT, Manchester, N. H.—*Street Gas Lamp Posts.*—January 3, 1865.—This invention consists in constructing a lamp post with an enlargement for the location of a gas meter, with proper door and fastenings, as a new article of manufacture.

Claim.—Constructing a lamp post with an enlargement for the location of a gas meter, with a door and fastening, as described, as a new article of manufacture.

No. 45,718.—E. D. HURST, Lancaster, Penn.—*Thread Guide for Spinning Machine.*—January 3, 1865.—The claim and engraving fully sets forth the nature of this invention.

Claim.—The use of a glass cylinder introduced into the eye of metallic guides through a perforation made for that purpose, in the manner specified.

No. 45,719.—HENRY C. HUTCHINSON, Cayuga, N. Y.—*Lamp.*—January 3, 1865; antedated September 12, 1863.—In a circular or oval wick-tube are arranged chambers for the bearings of a shaft carrying a ratchet for raising and lowering the wick.

Claim.—The combination of the ratchet A or the shaft F with the circular or curved wick-tube B and basin or chamber C, as and for the purpose substantially as described.

No. 45,720.—WALTER INGALLS, Sanborton, N. H.—*Method of Coupling Boats.*—January 3, 1865; antedated September 12, 1863.—In the stern of a boat is constructed a coupling arrangement, while its bow is built so that when attached to the stern of another boat a continuous hull, as it were, is preserved through both boats, or as many as may be in the train, so that the channel made by the first boat may be preserved throughout the entire train, and all the boats are more easily moved in the water than they could be if separated.

Claim.—The connecting or coupling of boats for navigation on rivers or canals into continuous lines or trains, by the means or mode substantially as herein described and set forth.

No. 45,721.—HIRAM JORDAN, Milford, Ohio.—*Corn Planter.*—January 3, 1865.—On the front beam of this plough is a spring, to which is attached a cord extending back and attached to an arm which is secured to a crescent-shaped seed cylinder. From this arm the cord extends to near the handles, where there is a jointed lever to which the cord is fastened. The seed cylinder is filled with seed, and by means of the lever and cord the cylinder is turned and its contents deposited at pleasure, and the springs cause the cylinder to return to its original position.

Claim.—The arrangement of conveying hopper A, crescent-shaped dropper B, lever C, rod D, spring E, shave F G, and roller H, the whole being combined and operating together in the manner specified.

No. 45,722.—E. B. JUCKET, Pawtucket, R. I.—*Pump.*—January 3, 1865.—A cylinder is formed with an induction and an eduction port on opposite sides, a ledge being formed around the interior beneath the lower line of these ports. A cylinder of much smaller diameter, and shorter, is formed with a surrounding disk near its top and another near its bottom. When

placed within the larger cylinder these disks fit into it, the lower one resting upon the interior ledge. The ports are thus between the disks, and vertical partitions transverse to the ports, serve to divide the water space equally. Valves are so arranged upon the disks that a piston moving in the smaller cylinder keeps up a continuous flow of water. Thus the operative parts of the pump may be readily removed for repairs and returned in perfect order.

Claim.—The combination of the cylinder and valve plates, constructed independent of the outer can, substantially as and for the purpose specified.

No. 45,723.—JOHN W. KINGMAN, North Bridgewater, Mass.—*Roofing*.—January 3, 1865.—This invention consists in covering the joints in a roof with a strip of metal, so formed as to make a yielding connection, so that the expansion or contraction of adjacent surfaces will not cause the joint to be exposed. This metal strip is nailed over the joint, and a strip of cloth is then cemented upon it.

Claim.—The spring plate *c d*, fastened as described and covered with cloth, cemented or pasted thereon, substantially as specified.

No. 45,724.—Z. P. LEACH, Danbury, Conn.—*Lifting Dock*.—January 3, 1865.—This invention consists: 1st. In the use of a series of toggle levers connected to each other, and to a rising and falling beam which supports the cradle in such manner that by exerting a strain upon a strap, rod or chain connecting the toggle levers, a powerful upward strain is produced on the beams supporting the cradle, and a vessel lying thereon can be lifted up and sustained above the surface of the water.

2d. In the application of supplementary beams provided with legs that may be turned in or out, and with dogs catching in suitable teeth in such a manner that when the cradle is attached to said beams and raised to a certain height, said beams, together with all the weight supported thereon, can be sustained by the dogs, and the main beams can be lowered to allow of turning in the legs and taking a fresh hold, in cases where the nicking capacity of the toggle levers is not sufficient to raise the vessel high enough out of the water.

Claim.—First, the toggle levers *D*, connected to each other by straps *E* or their equivalents, and operating in combination with the rising and falling beams *C*, substantially as and for the purpose herein set forth.

Second, the supplementary beams *C'*, provided with legs *b*, and applied in combination with the main beams *C*, and toggle levers *D*, in the manner and for the purpose substantially as described.

No. 45,725.—HIRAM LEMIN, Leonidas, Mich.—*Stump Extractor*.—January 3, 1865.—This invention is designed as an improvement upon a machine for extracting stumps for which a patent was granted to the present inventor, bearing date December 15, 1863. The invention consists in the application to the machine of a lever and springs or elastic bars, arranged in such a manner with pawls and ratchet, that the same means which are employed to extract a stump may be also used for gradually lowering it. In connection with the ratchet is a brake arranged in such a manner that an elevated body may, by a simple application of power, be held in suspension until it is necessary or convenient to remove it.

Claim.—The combination of the parts involved in freeing the ratchet wheel, to wit, the lever bar *P O*, bars *N*, pawls *K*, and segment wheel *Q*, with the lowering brake levers *U S*, and shoe *T*, substantially as described and represented.

No. 45,726.—MILES K. LEWIS and JOHN C. DURBIN, Iowa City, Iowa.—*Hay Loader*.—January 3, 1865.—This invention relates to the construction, arrangement and combination of the several parts designated by the claim, from which and the engraving it will be readily understood.

Claim.—The combination of the transverse rod *j*, lever *k*, shaft *d*, pulleys *cc*, cords *ee*, cross-bar *g*, with the rake, for the purpose of raising the rake with the gearing *a b*, when the vehicle is backed to which the machine is connected.

Also, the arrangement of the elevating belt of slats in connection with the rotating arms *P P*, for joint operation, as and for the purpose described.

No. 45,727.—H. S. LIPMAN, Philadelphia, Penn.—*Eyeletting Machine*.—January 3, 1865.—The punching and eyeletting operations are performed by the alternate right and left movement of the lever, and the novelty consists in the combination with such a machine of a punching die which makes a conical incision in the fabric with or without a central excised part.

Claim.—In combination with an eyelet machine, a die which makes a conical incision in the fabric for the reception of the eyelet with or without a central incision of a part, bearing the whole or a portion of the material to be embraced by the flange of the eyelet, substantially as shown and described.

No. 45,728.—HENRY MAYCOCK, Verona, N. Y.—*Cattle Stanchions*.—January 3, 1865.—Every alternate standard is pivoted at the lower end, the upper ends being connected by means of a rod. This rod is operated by means of a cord pulley and lever, so that by a single movement of the lever all the movable stanchions are adjusted.

Claim.—The arrangement and the combination of the lever J, rope K, operating on pulleys P, and the sliding rail L, when arranged and combined as herein described, for the purpose of operating the stanchions behind the cattle.

No. 45,729.—S. T. McDOUGALL, New York, N. Y.—*Apparatus for Carburetting Gases.*—January 3, 1865.—This invention consists of a vessel provided in the top with an aperture for the admission of a reservoir provided with a valve. The vessel is divided into two compartments by partitions, the said compartments communicating with each other by means of an aperture in the partition. One of the vessels is provided with one or more partitions secured alternately at the top and bottom of the chamber, arranged in such a manner that the last one shall always be secured at the bottom. The said partitions are provided with perforations which are below the surface of the hydro-carbon liquid when the vessel is in operation. In the spaces between the partitions are suspended sections of fibrous materials, so that their lower ends shall be immersed in the hydro-carbon liquid.

Claim.—First, the combination of a liquid or reservoir chamber B, a reservoir C, and a carburetting chamber D, for the purpose herein specified.

Second, the vessel A, composed of a chamber B and a chamber D, constructed and arranged substantially as and for the purposes herein set forth.

Third, the construction and arrangement of the chamber D, as provided with alternating close partitions or divisions 2 and 3, and intermediate fibrous or capillary divisions *h i j*, substantially as and for the purposes herein specified.

No. 45,730.—DANIEL McNAB, Moscow, Michigan.—*Cultivator.*—January 3, 1865.—This invention consists in constructing a cultivator or drill tooth with an upper curved portion, which has a bearing against some fixed part of the machine. The form of this curved portion and the position of the tooth determines the amount of resistance which it may overcome without being raised from the ground.

Claim.—Constructing a cultivator or drill tooth with an upper curved portion, which curved part shall have a bearing against some rigid portion of the machine when it is in motion, so that the form of such curved portion of the tooth, and the position of the tooth, shall determine the amount of resistance which it may overcome without its being raised from the ground.

No. 45,731.—B. E. MEAD, Peekskill, N. Y.—*Game.*—January 3, 1865.—The game consists of an imitation fort with a flagstaff. A number of holes serve to introduce balls, while a greater number of portholes serve to receive them, each being numbered in a special manner.

Claim.—First, the construction of the holes *z z* in the walls *a b c d*, in the manner and for the purpose substantially as set forth.

Second, the making of marks, figures, or indentations in the bottom of a box, in combination with figured holes in its sides for indicating the position of a marble at rest after being driven from one of the holes, in the manner and for the purpose substantially as set forth.

Third, the use of a flagstaff, in combination with the holes in the sides of the box, in the manner and for the purpose substantially as set forth.

No. 45,732.—DAVID H. METCALF and H. J. SHOEMAKER, Battle Creek, Mich.—*Store-pipe.*—January 3, 1865.—This invention consists of a stove-pipe with a smaller pipe arranged inside, in which is fitted a circular damper. The annular space between the two pipes has two balanced dampers, so fitted that when open they are supported by the two pipes.

Claim.—First, adapting balanced dampers *b b* to operate partially, when arranged at any desired point within the space formed by the two pipes A B, substantially as desired.

Second, so constructing and arranging the dampers *b b* within a space formed by the two pipes A B, that when these dampers are fully open they will be supported in this condition by the two pipes A B, substantially as described.

No. 45,733.—LORING MOODY, Malden, Mass.—*Car Coupling.*—January 3, 1865.—This invention consists of a car coupling, composed of a tripping lever, a curved pin, and a recessed bunter bar, arranged to operate automatically as the cars come in contact with each other.

Claim.—The combination of the separate curved pin C with the tripping lever B and the recessed bunter bar A.

Also, the combination of the separate curved pin C and its holding mechanism, viz.: the spring D and notch *f*, or their mechanical equivalent or equivalents, with the tripping lever B and the recessed bunter bar A, the whole being substantially as described.

Also, the combination of the slot *h*, or its mechanical equivalent, with the tripping lever, its curved pin, and the recessed bunter bar, the said slot being arranged in manner and for the purpose set forth.

No. 45,734.—JACOB MORGAN, Dundee, Ohio.—*Mode of Constructing Frames for Portable Houses.*—January 3, 1865.—This invention consists in a peculiar arrangement of braces,

posts, sills, &c., of a frame, whereby the same may be easily taken apart for transportation, and yet possess sufficient rigidity and strength when put up to answer its ends.

Claim.—A portable saw-mill frame, constructed and arranged with braces and tightening rods, substantially as herein specified.

No. 45,735.—E. H. MORTON, Oxford, Iowa.—*Ditching and Mole Plough.*—January 3, 1865.—This invention consists in a mode of attaching the sweep to the capstan, whereby the former is rendered capable of being adjusted, so as to be readily connected with, and disconnected from, the capstan, and admit of the latter being turned when the plough beam is drawn forward without turning the sweep, and without removing it from the machine. The colter is attached to the beam in such a manner that the former may be made to work at different angles relatively with the latter, as may be desired, and the colter and mole readily drawn out of the earth.

Claim.—First, attaching the sweep E to the capstan B, by means of the journal c and slotted bar D, on the latter, and the eye d on the sweep, substantially as and for the purpose set forth.

Second, in combination with the sweep E, the adjustable bail support G, constructed and applied to the capstan frame A, to operate as and for the purpose described.

Third, the securing of the colter K to the beam H through the medium of the slot a and adjustable plates J J', arranged substantially as herein set forth.

No. 45,736.—JOSEPH MUIR, New York, N. Y.—*Machine for Condensing Pap, or Slops of Clay, for Potter's use.*—January 3, 1865.—This invention consists of a whirling vessel having impermeable sides, with an inclined rim at the top, and attached to a rotating disk, combined with mechanism for rotating it, and a draw-off pipe.

Claim.—First, the whirling vessel having imperforated sides impermeable to water and inclining inward, or with a rim at the top, and combined with mechanism for rotating it, substantially as described, and substantially for the purpose hereinbefore set forth, and with the draw-off pipe h, or its equivalent, in combination with the whirling chamber.

Second, securing the whirling vessel to the rotating mechanism by means of a disk or platform e and the screw bolts g and g', or their equivalents, for the purpose of conveniently attaching or removing the whirling vessel.

No. 45,737.—JOSEPH MUIR, New York, N. Y.—*Process of Preparing Clay for Potters' use.*—January 3, 1865.—This invention consists in separating the slops of clay from the water by the action of centrifugal force upon the slops, when contained in a whirling vessel, having impermeable sides, an inclined rim at the top, and a draw-off pipe.

Claim.—As my improvement, in the process of preparing clays for potter's use, or for the market, the above-described improved-mode of condensing the pap or slops of clay by subjecting the slops in proper quantities to the action of centrifugal force in a whirling vessel having imperforated and impermeable sides, substantially as described, whereby the clay, by reason of its adhesiveness and greater specific gravity, is condensed and separated from the water to the desired extent without recourse to straining, by which a portion of the clay is lost and adheres to the sides of the vessel from which it may be removed in a plastic state for potters' use, or to be prepared in the usual manner for the market as potter's clay.

No. 45,738.—WILLIAM NASH, Watertown, N. Y.—*Hand Punches.*—January 3, 1865.—This invention consists in applying a movable gauge to the lower limb of the punch, so as to be able to punch holes in a line with each other and with the edge of the material operated upon; and also in operating the cutting arm of the punch by means of a free lever, instead of making it part of one of the handles, according to the usual construction.

Claim.—First, a hand punch for cutting leather, paper, metals, and other materials, wherein the punch lever is independent of the movable arm of the handle of the punch, but is operated by the toe thereof, as by a free lever not connected with the punch lever by any joint or hinge, substantially as above described.

Second, the combination with a hand punch of any adjustable gauge i, substantially as and for the purpose above set forth.

No. 45,739.—JOHN E. NEILL, Brooklyn, N. Y.—*Steam Boiler.*—January 3, 1865.—This invention consists in superheating steam in the boiler in which it is generated. It is claimed as applicable to a Martin boiler, and the device consists of a number of tube boxes of the above-named boiler for the purpose of superheating steam, which is accomplished by removing a portion of the tubes of each and supplying their places with nests of tubes, arranged in such a manner that the steam from the steam-spaces of the boiler in its passage to the engine passes through them and is superheated.

Claim.—Incasing a portion of the tubes of a tubular steam boiler substantially as herein described, so that such casing shall extend on one side to the steam chamber of the boiler to receive steam generated in the boiler and conduct it to the tubes so incased, to be thereby superheated, and on the other side communicate with the outside of the boiler to carry off the steam after it has been superheated substantially as described.

Also, combining with superheating tubes, or the equivalent thereof, a water tube or tubes, or the equivalent thereof, for the protection of the tubes or flues of a superheater against the intense heat of the products of combustion, by causing such products to act first on the surfaces protected by water, substantially as herein described.

No. 45,740.—HARRISON OGBORN, Richmond, Ind.—*Grain Screen*.—January 3, 1865.—This invention relates to the combination of a riddle and screen suspended upon adjustable straps and having a very rapid motion communicated by means of a cam wheel and lever. The riddle is adjusted in the opposite direction to the screen.

Claim.—The cam wheel J and lever K, in combination with the riddle G, screen I, and adjusting straps E, the several parts being constructed, arranged, and operating substantially as and for the purposes set forth.

No. 45,741.—A. M. OLDS, Chicago, Ill.—*Lumber Measure*.—January 3, 1865.—The object of this invention is to obtain an instrument by which the number of superficial feet contained in boards of different lengths can be estimated. Within a suitable case is placed a disk in a vertical position, which by being made to pass over the surface of the boards indicates on a dial their superficial contents. Connected to the shaft of the disk is a sliding shaft, carrying on its end an endless screw or equivalent device through which the motion of the shaft of the measuring disk is transmitted to the arbor, carrying the index heads in such a manner that by simply adjusting the sliding shaft the instrument can be set for boards of different lengths. A sleeve projecting from the bottom of this case and terminating under the centre of the disk enables the operator to commence measuring with the edge of the board directly under the centre of the disk.

Claim.—First, a lumber measure arranged substantially as described, so that with a measuring disk of uniform diameter the superficial feet of boards of different lengths can be determined.

Second, the nest of wheels $f' f' f''$ &c., applied in combination with the disk A, sliding shaft h , and index hands $c d$, substantially as and for the purpose set forth.

Third, the shoe p , in combination with the measuring disk A, constructed and operating substantially as and for the purpose described.

No. 45,742.—JOHN PEACE, Camden, N. J.—*Cutter Stock*.—January 3, 1865.—This invention consists in the construction and arrangement of certain devices which require a reference to the drawings to be understood.

Claim.—As a new article of manufacture, a cutter stock constructed as herein shown and described.

No. 45,743.—JOHN G. PERRY, South Kingston, R. I.—*Sausage Filler*.—January 3, 1865.—This invention consists in the combination of a cylinder with a sloping bottom, and a rack and piston head geared so as to fit the sloping bottom of the cylinder, in order that all the meat may be forced into the nozzle.

Claim.—The construction of the nozzle s and cylinder or case A with the piston head and rack B, constructed substantially as herein described and for the purpose set forth.

No. 45,744.—JOHN G. PERRY, South Kingston, R. I.—*Meat Cutter*.—January 3, 1865.—This invention consists in the combination of two plates cast with apertures, with bevelled edges into which the knives are secured, and also the combination of said plates and knives with the other parts of the machine, so that meat can be speedily cut for use.

Claim.—First, the combination of the knives $x x x$ with the plates S, constructed substantially as described and for the purpose set forth.

Second, the combination of the knives and plates S with the case A and shaft B, substantially as herein described and for the purposes set forth.

No. 45,745.—J. G. PERRY, South Kingston, R. I.—*Stove-pipe*.—January 3, 1865.—A stove-pipe elbow cast in two segments, one having a bearded flange to shut over the edge of the other; close to this flange at either end of the elbow is a slot into which projections cast on the other segment fit. The elbow is smaller at one end than at the other. A damper is placed at a point midway between the ends.

Claim.—First, as a new article of manufacture a cast-iron stove-pipe elbow made in two parts and having one end made small enough to receive the pipe on the outside, and the other end large enough to receive the pipe on the inside, with the projections or fastenings, when constructed substantially as herein set forth and for the purposes specified.

Second, the combination of the damper with the two parts of the elbow, substantially as herein described and for the purposes set forth.

No. 45,746.—J. G. PERRY, South Kingston, R. I.—*Machine for Cutting Soap*.—January 3, 1865.—This invention consists of a trough, near one end of which slots are cut. A lever is so pivoted as to come directly under the slots, so that the wire R may be drawn down into them and through the soap.

Claim.—The combination of the wire R, lever B, and box A, substantially as herein described and for the purpose set forth.

No. 45,747.—J. G. PERRY, South Kingston, R. I.—*Window Sash Supporter*.—January 3, 1865.—This invention consists of two cams geared together by means of a tooth in one biting in a notch in the other. To the lower one is attached a lever or thumb piece, by raising which both cams are turned from each other, and the sash into the sill of which they are inserted is free to move in either direction. By releasing the lever the cams approach each other and impinge upon the frame of the window, one preventing the upward, the other the downward motion of the sash.

Claim.—The combination of the two cams or curved levers with the projections *o c*, constructed substantially as herein described and for the purpose set forth.

No. 45,748.—JOHN C. PLUMER, M. D., Portland, Maine.—*Boot and Shoe Last*.—January 3, 1865.—The object of this invention is to produce a last on which a boot or shoe can be made, which shall at once, without the tedious process of breaking in, conform and adapt itself to the contour of the solid structure of the bottom or sole of the natural human foot, so that the use of the boot or shoe shall tend to preserve its natural form, rather than to distort it.

Claim.—First, in the construction of a shoe last, the transverse inclined planes L G and Y Y, as described, in combination with the prominences G L, as described.

Second, the form and location of the prominences G L, as described.

Third, the form and location of the concavity D D D D, as described.

Fourth, the combination of the planes, concavities, and prominences, as described.

No. 45,749.—RUFUS PORTER, Malden, Mass.—*Fan Blower*.—January 3, 1865; ante-dated June 23, 1864.—Two cams of peculiar form are arranged to revolve in contrary directions within a box of suitable shape. These cams are so regulated in their motion by means of a combination of pitmen outside, that portions of the periphery of each cam shall be constantly contiguous, while the two ends or wings of each move in proximity to the curved sides of the box.

Claim.—The regulator I J K L M N, in combination with the cams A B in box *c*, all combined for the purpose herein specified.

No. 45,750.—T. T. PROSSER and M. C. DARLING, Chicago, Ill., and K. A. DARLING, Fond du Lac, Wis.—*Cultivator for Gang Plough*.—January 3, 1865.—In this invention the plough beams diverge, and at their forward end are secured to a cross-beam by bolts and screw-nuts upon each side of the beam, so that they can be adjusted in order to throw two ploughs further apart or nearer together. The tongue is operated by a pulley, and a chain or rope passing around a pulley; the pulley being actuated by a foot lever.

Claim.—First, guiding and regulating the movement of the tongue D by means of the pulley H, chain F, eye bolts G, attached to the side frame A and levers H, substantially as described.

Second, connecting the pair of draught arms B B, without regard to the number of pairs used, to the forward main cross-bar of the frame A by means of the double-nutted screw bolt L L, and which forms, with the plates M M, a hinge or other joint, so that while the said bars shall have a free vertical motion, they may be adjusted laterally without being detached or removed from the said cross-bar.

Third, constructing a cultivator or gang plough so that the interval between the shank N N, which supports the ploughshares, may be increased or diminished without removing the shaft bars B B, or their connections, from the main cross-bar of the frame A, when each pair of shaft bars are capable of lateral adjustment, independent of the other pair or pairs.

Fourth, the combination of lever T, rods and polls U U, operating the ratchet wheel S upon the roller O, for elevating simultaneously the several ploughs of the gang or gaugs, substantially as set forth.

No. 45,751.—GEORGE B. PULLINGER, Germantown, Penn.—*Meat and Vegetable Slicer*.—January 3, 1865.—This invention consists in combining an adjustable rotating gauge plate with a rotary knife, also a frictional feed, for the purpose of moving the articles to be cut.

Claim.—First, the adjustable rotating gauge plate D, as described and for the above purpose.

Second, the scoring knives *c c c*, in combination with the rotating gauge plate, as described and for the above purpose.

Third, the slotted stay *r*, for securely holding the end of the cutter C, as above described and for the purpose specified.

Fourth, the frictional feed motion, as constructed, and operated as described for the above purpose.

No. 45,752.—W. T. RIPPON and THOS. R. ROBINSON, Providence, R. I.—*Self-oiling Spindle Bolster for Spinning Frames*.—January 3, 1865.—The claim and drawings sufficiently define the nature of this invention.

Claim.—First, the oil chamber, composed of a socket tube, with collars or flanges *d e*, applied in combination with the oil chamber *b*, formed within the rail, substantially as herein specified.

Second, the washer or gasket D, arranged within the oil chamber, and the nut C, applied to a screw thread on the bolster below the rail; the whole combined substantially as and for the purpose specified.

No. 45,753.—EDWARD S. RITCHIE, Brookline, Mass.—*Instrument to determine the Variation of the Compass*.—January 3, 1865.—This instrument consists of a box, like that of a surveying compass, with a revolving compass card on the bottom, and a rotary cross-bar with sights for ascertaining the magnetic bearing of distant objects. It is to be used in conjunction with the mariner's compass, on shipboard, to correct for local attractions. The manner of using must be gathered from the specification.

Claim.—The construction of the rotary compass cord A, the separate supporting index plate c, the rotary bar D, provided with sights or their equivalents, the clamp F, and the index pointer G, or its equivalent, the whole being arranged and applied substantially as specified.

Also, in combination therewith, the divided limb H and the auxiliary sight index I.

No. 45,754.—CHARLES H. ROBINSON, Bath, Maine.—*Press*.—January 3, 1865.—This invention relates to a press for baling, and consists in an arrangement of levers applied to the follower in such a manner as to render the press very compact, and also very efficient.

Claim.—The levers D D, attached to the platten or follower c, in combination with the swinging arms E E and the ropes O G, all being arranged and applied to operate in the manner substantially as and for the purpose herein set forth.

No. 45,755.—JOEL SANFORD, Polo, Ill.—*Water-wheel*.—January 3, 1865.—This invention consists in the construction of the buckets, each of which is formed of three arcs, described from several centres. The backs of the buckets are formed of two different curved surfaces, one being a part or a circle described from a centre which is at the centre of the radii e e, which intersects the radii b two-thirds of their length from the centre of a plate A.

Claim.—A water-wheel constructed with buckets C, each formed of three arcs described from the several centres d f' a', all as herein shown and described.

No. 45,756.—DANIEL SEXTON, San Gabriel, Cal.—*Steam Engine*.—January 3, 1865.—The novelty of this invention consists in the arrangement of two pistons, which work in separate cylinders, and are connected by a rigid bar, carrying two studs, in combination with a lever secured to the end of an oscillating shaft, on which is mounted a cog wheel or pinion, gearing in toothed racks attached to two slide valves in such a manner that, by the action of the studs striking the oscillating lever, the valves are changed at regular intervals, and one cylinder takes steam, while the other exhausts, and by these means a continuous motion is effected.

Claim.—First, the two pistons D D', connected together by the bar E, and operating in open cylinders A A', in combination with the abutment C, valve H H', and ports d d' d' d', in the manner and for the purpose substantially as herein shown and described.

Second, the lever F and sheds a a', in combination with the pistons G and valves H H', constructed and operating substantially as and for the purpose set forth.

Third, hinging the lever F, as and for the purpose specified.

No. 45,757.—EDWARD L. SEYMOUR, New York, N. Y.—*Ore Separator*.—January 3, 1865; antedated December 9, 1862.—A charge of comminuted ore having been let down upon the bottom of a drawer with a perforated bottom closely fitting into the lower extremity of a hollow cylinder or trunk, the air in the trunk above the charge is rarified by means of an air pump or bellows. This causes the air within the mass to dilate, and with the help of the ambient air which rushes through the open interstices of the bottom drawer, to momentarily suspend the particles, after which they settle according to their specific gravity—the heaviest first. The refuse being thus in a stratum by itself may be gotten rid of.

Claim.—The combination of trunk or cylinder G with the movable drawer F, for the purpose of separating and separately delivering the refuse and the concentrated portion of each separate charge, as described.

Also, in combination with the cylinder G, the air pipe V, as described, and for the purpose described.

Also, the combination of the exhausting apparatus A, or its equivalent, with the movable box F, with or without the cylinder G, as described, and for the purposes described.

No. 45,758.—LYMAN SHERWOOD, Marine, Ill.—*Cultivators*.—January 3, 1865.—In this machine two rollers are made to pass, one each side of the row of corn, for crushing the sods. Just back of each roller, a bar runs diagonally, carrying several cultivator teeth. The draught pole is fastened at a point under the front of a long seat, and plays vertically in a slotted standard on the front of the frame. The driver, by moving forward on the seat, throws the ploughs out, and the rollers then act as traction wheels.

Claim.—First, the arrangement of the frame A A', with its teeth or ploughs c c, in combination with the rollers B B, all being constructed and arranged to operate substantially as and for the purposes set forth.

Second, the arrangement of the pole E with reference to the frame A and standard f, substantially as and for the purposes set forth.

No. 45,759.—EDWIN F. SHOENBERGER, Philadelphia, Penn.—*Car Seats of Railway Cars*.—January 3, 1865.—This invention consists of a longitudinal bar with teeth, in combination with a cog wheel, so connected to the back of each seat of a row in a railway car that one back cannot be turned without turning the whole, thereby preventing passengers from adjusting the backs to suit themselves, and at the same time affording means for turning the whole of the backs simultaneously.

Claim.—The bar *L* and its teeth, in combination with the cog wheel *f*, so connected to the backs of the whole row of seats that one back cannot be moved without disturbing the whole, as set forth for the purpose specified.

No. 45,760.—WILLIAM H. SHORT, Brooklyn, E. D., N. Y.—*Grates for Furnaces*.—January 3, 1865; antedated August 12, 1863.—This invention consists in the arrangement of spaces between the inner ends of divided grate bars, their outer ends being held in place by hooks catching over the front plate and over the bridge wall or over bars connected with or attached to the said plate and wall in such a manner that each grate bar can expand and contract without impeding or obstruction, and consequently the said bars are not liable to injure the structure of the wall in which the boiler is set, nor are they liable to bend or break by the expansion.

Claim.—The combination and arrangement of the grate bars *B* so as to form spaces *c* between their inner ends in the middle of the grate *A* and the bevelled shoulder of the adjoining bars, substantially as and for the purpose herein shown and described.

No. 45,761.—ROBERT A. SMITH, Philadelphia, Penn.—*Ash Cart*.—January 3, 1865; antedated July 21, 1863.—The cart is provided with a receptacle of a capacity sufficient to contain five ordinary loads. This receptacle has one permanent side and permanent ends, and is furnished with a tilting-box, operated by a shaft, by means of which its whole contents can be discharged with promptitude.

Claim.—A cart having a receptacle composed of a permanent side *D* and permanent ends *D'*, and the tilting or dumping-box *G*, hung or secured to a shaft *F*, and constructed and applied to the permanent portion of the receptacle, substantially as and for the purpose herein set forth.

No. 45,762.—J. GALUSHA STAUNTON, Buffalo, N. Y.—*Process of Preserving Organic Substances*.—January 3, 1865; antedated April 3, 1862.—This invention consists in preserving fruit, vegetables, &c., by covering them with a crust or shell of paraffine.

Claim.—The method of preserving fruits, vegetables, and the like, by means of forming an external crust, shell, or covering of paraffine in contact with the body of the fruit or thing to be preserved, substantially as described.

No. 45,763.—J. GALUSHA STAUNTON, Buffalo, N. Y.—*Vessels for Preserving Butter and other Substances*.—January 3, 1865; antedated April 3, 1863.—This invention consists in constructing a can or vessel for preserving fruit, &c., of wood, which is made air-tight by an internal lining of paraffine or its equivalent.

Claim.—A new article of manufacture, a box, can, or vessel for preserving fruit, vegetables, meat, butter, spices, and the like, constructed of wood, and made air-tight by an internal lining or enamel of paraffine or equivalent, substantially as described.

No. 45,764.—J. GALUSHA STAUNTON, Buffalo, N. Y.—*Cases for Preserving Animal and Vegetable Substances During Transportation*.—January 3, 1865; antedated May 5, 1863.—This invention is fully explained by the claim.

Claim.—First, a transportation case having a plurality of walls, substantially as described, in combination with a distinct ice-chest in connection therewith, for the purposes set forth. Second, a skeleton framework of wood covered with leather, cloth, rubber, or other equivalent materials, in a manner to form a plurality of walls, which spaces may be filled with cotton, wool, or other poor conductor of heat or dead air, for the purpose and substantially as described.

Third, an ice-chest made separately from a transportation case, and so combined and connected to the outside of the case that a free communication of air from the ice to the interior case is secured, substantially as set forth.

No. 45,765.—J. GALUSHA STAUNTON, Buffalo, N. Y.—*Preserving Fruit, Meat, Fish, &c.*—January 3, 1865; antedated May 18, 1863.—This invention consists in substituting hydro-carbon gas in the place of air in cans or vessels in which fruit or other substances are enclosed for preservation.

Claim.—The substitution of hydro-carbon gas in the place of air in the cans or vessels in which fruit or other substances may be enclosed for preservation, for the purposes and substantially as above set forth.

No. 45,766.—J. GALUSHA STAUNTON, Buffalo, N. Y.—*Air-tight Boxes, Cases, &c.*—January 3, 1865; antedated May 18, 1863.—This invention consists in applying to the joints of wooden or board packages a thread or welt of rubber. The insides of these wooden packages are also coated or lined with paraffine, gum, or other similar substance, for the purpose of rendering the said packages air-tight.

Claim.—The application and use of a thread or welt of rubber throughout the joints of wooden or board packages, for the purpose and substantially as described.

Also, coating or lining the inside of such wooden packages with paraffine, warp, gum, or other impervious substance, in combination with the welted joint, for the purpose and substantially as described.

No. 45,767.—JAMES H. STEVENS, East Durham, N. Y.—*Manure-spreading Device.*—January 3, 1865.—This invention consists in applying to a wagon a movable bottom composed of an apron, which works on friction rollers, and arranged to operate as an endless belt; and in connection with this movable bottom is a fork, arranged to operate in such a manner as to discharge the manure evenly or uniformly from the wagon, as the same is fed to the fork by the movable bottom. Also, in the employment or use of a semi-conical screen attached to the rear of the wagon for the purpose of receiving the manure as it is discharged by the fork, thereby insuring a uniform distribution thereof upon the field.

Claim.—First, the two ropes *d d'*, with the shaft *F*, for operating the apron *D* and admitting of the same being moved back when the load is discharged.

Second, the semi-conical screw *K* at the rear of the wagon, when used in connection with a manure-discharging device, for the purpose set forth.

Third, the discharging fork *I*, arranged to operate substantially as herein described, in connection with the apron *D*, or its equivalent, for the purpose set forth.

No. 45,768.—LEONARD J. STAISTNY, Hoboken, N. J.—*Process for Preparing Refuse Wool for use.*—January 3, 1865.—This invention consists in placing the wool in a chest provided with a perforated false bottom and perforated top, and subjecting it to the action of steam. A stream of water is then forced through an aperture in one side of the chest and drives the wool towards the other side, and through an aperture provided with a net of wire, the large burrs and other bulky matter being left behind. The water is then pressed from the wool, and it is subjected to the action of a liquor, consisting of sulphuric acid of about 10° Baumé, and a temperature of 120° Fahrenheit. The wool is left in this bath for about five hours, when it is taken out and washed and placed in the known centrifugal machine. It is then placed in a drying machine, consisting of two concentric cylinders, the outer one made of sheet-iron, and the inner one made of wire gauze, and subjected to heat. It is then subjected to the action of a picking machine, which removes the dust to which the burrs have been reduced.

Claim.—The treatment of the wool as described, by applying to it, in connection with the treatment of it by an acid solution as described, but prior thereto, steam, in the manner substantially as set forth.

Also, in connection with the treatment of wool by an acid solution, as described, and after the said treatment is completed, the application of a high degree of heat to the wool during the drying process, for the purpose of burning the vegetable parts which may still adhere to said wool, substantially as described.

No. 45,769.—JOSHUA C. STODDARD, Worcester, Mass.—*Horse Rakes.*—January 3, 1865.—This invention is explained by the claim.

Claim.—The operating of the rake, to enable it to discharge its load and to bring it back to a working position by means of the adjustable shaft *M*, pinion *P*, having the cam *R* attached to its inner side, composed of a circular rim *e* with two recesses *f f*, the fixed roller *g*, wheel *Q*, and lever *O*, with spring *d*, all arranged and combined to operate in the manner substantially as described.

No. 45,770.—HORATIO N. TAFT, Washington, D. C.—*Combination of Pen-rack, Calendar, and Letter-balance.*—January 3, 1865; antedated November 24, 1861.—A pen-rack supports a cylinder containing rotating disks, representing the weeks, months, and days; an ordinary letter-balance surrounding the whole.

Claim.—The calendar, constructed and arranged substantially as described, and its combination with the pen rack.

Also, the combination of the calendar with a balance or weighing scale, and also the combination of the letter-balance with a pen-rack, as set forth.

No. 45,771.—JOSEPH T. TOMKINS, New York, N. Y.—*Method of Seaming Barrel Heads.*—January 3, 1865; antedated November 24, 1861.—This invention is designed to avoid removing hoops to take out or put in the head by inserting a ridge-shaped piece centrally between the two halves, (or less than half,) which, being driven in, forces these into position; or, by withdrawing this ridge, the halves may be approached and not fall out.

Claim.—The use of the piece *A*, substantially in the manner and for the purposes described.

No. 45,772.—B. T. TRIMMER, Rochester, N. Y.—*Grain Separator.*—January 3, 1865.—In this invention the shoe, fan, and fan-case are combined in one body, thus dispensing with an outer casing. This combination is all supported upon the fan shaft, which has a cam in the journal for giving a shake motion.

Claim.—Combining the shoe D and fan case E' in one body, thereby dispensing with an outer casing, substantially as herein set forth.

Also, supporting the shoe D and fan case E, combined in one body on the fan shaft *a* by means of the cams or cranks F, and in such a manner as to impart a universal vibration, substantially as herein specified.

No. 45,773.—ALFRED WALKER, New Haven, Conn.—*Caster for Furniture*.—January 3, 1865.—This invention consists of parallel grooves, which are both vertical and horizontal upon the pintle or shaft, and are traversed by a pin or projection within the socket, and so arranged that the caster is not liable to drop out of the socket, but can be taken out and put in instantly.

Claim.—A combination of vertical and horizontal grooves, with or without the rest *e*, with a pin to traverse the same, substantially as is herein described.

No. 45,774.—THOMAS H. WALTON, Ashland, Penn.—*Blasting Fuze*.—January 3, 1865.—This invention consists of a strip of wood, of a round or of any other desired form, in one side of which a narrow groove is ploughed of any suitable shape; in this groove a train of powder is laid, which is covered and protected by being overlaid with some water-proof material.

Claim.—The safety blasting fuze, constructed substantially as above set forth.

No. 45,775.—GEORGE W. WARREN, Ossian, N. Y.—*Broadcast Seeder*.—January 3, 1865.—In this machine two harrows for covering the seed are attached to a horizontal jointed bar in the rear of the seed distributor. These bars are pivoted to uprights in the centre of the harrows, and then extend beyond to the rear, thus preventing any overturning of harrows by obstacles.

Claim.—The jointed bar G, provided with the arm *p*, in combination with the harrow C, standard *m*, shaft H, and frame A, the whole so arranged that while the draught is applied centrally to the harrow, the latter is prevented from overturning, substantially as herein set forth.

No. 45,776.—E. P. WATSON, New York, N. Y.—*Combined Spur Carrier, Boot Drawer, and Pantaloons Guard*.—January 3, 1865.—A metallic plate is provided with a projecting flange and with screw holes. This plate is attached to a boot-heel so that the flange may prevent the bottoms of the pantaloons from getting under the boot-heel, may furnish a foot hold for drawing off the boot, and may serve as a support for spurs.

Claim.—A metallic plate, constructed substantially as above described, so that it can be attached by springs or screws to the heel of a boot, for the object hereinbefore specified.

No. 45,777.—WM. WEITLING, New York, N. Y.—*Sewing Machines*.—January 3, 1865.—This is a button-holing machine and uses five threads and a cord for the edge of the button-hole. Two similar eye-pointed needles (each carrying a thread) are secured to the same needle-bar: one penetrates the cloth, the other passes through the button-hole. Two other threads are so twisted by revolving thread carriers as to be laid upon and stitched to the surface of the cloth. The loops left below the cloth by the rising of both needles are both locked by the passing through them of the shuttle and its thread.

Claim.—First, the combination in a sewing mechanism of one or more revolving thread leaders and their supports with the adjustable frame of the cloth presser, so that all of them may be raised and lowered by the same mechanism, substantially as and for the purposes set forth.

Second, supporting the bobbins which supply the revolving double-thread carrier on a revolving table, for the purpose of preventing the threads from twisting before reaching the double-thread carrier, substantially as and for the purposes described.

Third, a feeding device, feeding the fabric by the action of a chisel-edged pad against the inclined under surface of an upper reciprocating pad or cloth pressure, thus operating by a pinching and direct angular pressure instead of by vertical pressure, substantially as and for the purposes set forth.

Fourth, the combination of the levers F and toggle arms G with the needle-bar C and thread-guide *g*, constituting my thread-delivering regulator, substantially as and for the purposes described.

Fifth, the application to a sewing mechanism of the turning table H' upon the bed-plate A, serving as a support to the fabric, and having the needle as the centre of motion when said table is suspended to the needle-arm, substantially as and for the purposes described.

Sixth, securing the guide-pins O to the adjustable frame F of the cloth presser, so that they can be raised and lowered together with said cloth presser, substantially as and for the purposes described.

Also a feeding device, with smooth surfaces, operating by the angular motion of two parts acting on each other, and thus gripping the fabric between them and moving it forward, substantially as described.

No. 45,778.—B. T. M. WELLS, Franklin Centre, Vt.—*Railroad Cars*.—January 3, 1865.—This invention relates to a means for facilitating the starting of the cars whereby considerable power is gained and the team greatly relieved. Loaded cars may, when they are started, be drawn with great facility by a team which would not be able to start them, or only with great difficulty. This invention is designed to obviate this trouble in starting the cars at any time or at any point on the track where it may be necessary for a car to stop.

Claim.—The loose pulley D with draft-chain I attached, in connection with the ratchet E, attached permanently to the axle C, and the pawl F placed within the pulley, to operate in the manner substantially as and for the purpose set forth.

Also, the eccentric, G G in connection with the rod b, passing through the pawl F, all arranged as shown, to free the pawl from the ratchet when the pulley is thrown back, as herein described.

Also, the coil-spring H, in combination with the pulley D, ratchet E, and pawl F, arranged substantially as and for the purpose specified.

Also, the stops g g attached to the eccentrics G G, when used in connection with the pulley D, spring H, pawl F, and ratchet E, for the purposes set forth.

No. 45,779.—P. WERNI, Manchester, Mich.—*Converting Rotary into Reciprocating Motion*.—January 3, 1865.—This invention relates to that class of devices for converting rotary into reciprocating motion, in which a pinion is used, which has its teeth cut away on one half its circumference, and which gears alternately in the upper and lower edge of a double rack, so that by imparting to said pinion a rotary motion the double rack receives a reciprocating rectilinear motion.

Claim.—The employment of inclined planes a d and spring e in combination with the double rack A and pinion B, constructed and operating substantially as and for the purpose set forth.

No. 45,780.—JOHN B. WEST, New York, N. Y.—*Garment Measuring*.—January 3, 1865; antedated September 8, 1862.—The nature of this invention is explained by the claim.

Claim.—Using instruments substantially such as specified, or their equivalents, upon or against the specified parts of the body, in such manner that right angles or corners are formed by them at the points where they cross or intersect each other, and from the sizes and forms thus ascertained may be readily drawn by running in from a perpendicular line, producing a bust of the measured body upon cloth, which bust, used in connection with certain measures herein indicated, taken from the body, but not embraced in the bust, and with the ordinary graduated tape, serves as a guide or basis from which to draught with certainty a garment the size and shape of the body measured as set forth.

No. 45,781.—ELONZO S. WHEELER, Westford, Conn.—*Buttons*.—January 3, 1865.—The button has a tubular shank, a washer between the hub and the cloth, and a washer outside the cloth, upon which latter washer the end of the tube is turned over.

Claim.—The combination of the two washers or disks with the hollow shank and the button, substantially as and for the purposes described.

No. 45,782.—THOMAS WILES and JAMES MCGINNIS, Muscatine, Iowa.—*Cultivator*.—January 3, 1865.—In this invention two vertically-adjustable plough beams are combined with two laterally and vertically-adjustable arms. All are connected with a horizontal shaft by cords, so that a hand-lever connected with the said shaft adjusts the ploughs.

Claim.—The combination of the rising and falling or vertically-adjustable ploughs O, with the rising and falling and laterally-adjustable ploughs I, when the latter are pivoted to shafts D D, and connected to the shaft P, so as to rise simultaneously with the ploughs V, on the turning of the shaft P, as and for the purpose herein set forth.

No. 45,783.—WILLIAM WHEELER, Poultney, Vt.—*Stove*.—January 3, 1865.—This invention consists of a spherically-shaped fire-pot, the upper part being pierced with numerous small holes, through which air is admitted down upon the whole surface of the fire. The products of combustion pass through one or more narrow flues into a radiating chamber, and thence escape into the chimney. In the top of the fire-pot is an open space extending from front to back between the flues, the bottom of which is perforated to admit air into the combustion chamber. The fuel door is perforated, and a damper in the fire-box regulates the draught.

Claim.—The employment of the spherically-shaped fire-pot or chamber of combustion B, or its equivalent, with numerous small apertures b, in the upper surface thereof, in the manner and for the purposes substantially as herein described and set forth.

Also, the employment of the contracted and oblong throat D, and the narrow circular flues or throats D D, in the manner and for the purposes substantially as herein described and set forth.

Also, the combination of the said throats or flues D, with the said fire-pot or combustion chamber B, and with the heating or radiating chamber c, substantially as and for the purpose herein described and set forth.

No. 45,784.—JOHN H. WILLIAMS, Oakland, Cal.—*Window Sash Suspenders*.—January 3, 1865.—This invention consists of a sash suspender so arranged that the cord, pulleys, and plate hook are completely hid from view and exposure to the weather, the whole being so nicely balanced as to overcome a large amount of friction which exists in other methods for suspending sashes.

Claim.—The arrangement and combination of the pulley plates M M, grooves L L, plate hooks B B, and slotted bar H, substantially as described, for the purpose set forth.

No. 45,785.—SETH WILMARTH, Boston, Mass.—*Machine for Drawing Bolts by Hydraulic Pressure*.—January 3, 1865.—This invention consists in grasping the head of a bolt to be withdrawn from wood by two or more wedge-shaped jaws, sliding in inclined slots within a cavity formed in the base of the outer cylinder of a hydraulic jack, whereby an immense force may be applied in an advantageous manner, the line of draught being directly in the line of the axis of the bolt.

Claim.—A bolt-drawing machine, consisting of a vice or jaws for grasping the bolt, in combination with a hydraulic lift for withdrawing the same, operating substantially in the manner herein set forth.

No. 45,786.—EDWIN A. WOOD, Utica, N. Y.—*Steam Pressure Gauges*.—January 3, 1865. This device is made of two circular disks of sheet brass, so corrugated as to present concentric indentations in order to impart to them greater stiffness. They are placed about one-fourth of an inch apart, and are held in position by a band of the same material, with which the edge of each disk is interlocked, and to which they are soldered.

Claim.—The combination of the disks A and B; or the ring D, or their equivalents, constructed and operating substantially as described, for the uses and purposes.

No. 45,787.—HIRAM YOUNG, New York, N. Y.—*Coffee-pot*.—January 3, 1865; antedated December 11, 1861.—This invention consists in the combination of two strainers with a tube and faucet arranged within the body of the coffee-pot. The cover of the coffee-pot is constructed with an opening at its apex, through which the top and its attachments may be inserted so as to serve as a funnel.

Claim.—The combination of the two strainers E F, tube C, and faucet B, arranged with the body A, substantially as and for the purposes set forth.

Also, constructing the top or cover G of the coffee-pot with an opening at its apex to admit of the inserting of the top and its attachments to the tube C, to serve the purposes of a funnel, as described.

No. 45,788.—WILLIAM G. BELL, Boston, Mass., assignor to WILLIAM G. BELL & Co.—*Meat Cutter*.—January 3, 1865.—Removable guides are combined with the cutter heads so that, by withdrawing said guides, the cutter-heads may be inverted and the knives cleaned and sharpened without being removed from the heads, and the introduction of meat to be chopped and the removal of chopped meat facilitated. The block is vertically adjustable, and receives a rotary motion by means of an endless screw and worm wheel.

Claim.—First, the employment or use of a movable guide I, in combination with the cutter head F, substantially as and for the purpose set forth.

Second, the endless screw M and worm wheel N, applied in combination with the centre pin C, bridge B, and block D, in the manner and for the purpose substantially as described.

No. 45,789.—JOHN E. BLYTHE, New York, N. Y., assignor to M. VEDDER and HENRY S. MYERS.—*Spring Gun*.—January 3, 1865.—This invention is explained by the claim.

Claim.—The use and application to guns and pistols of one or more revolving concave rollers or pulleys upon or around which India-rubber or other elastic material is made to pass, thus securing an additional length of stretch or propelling force in a given space, increasing in proportion to the number of rollers used.

Also, the combination of India-rubber in guns and pistols, with slide-roller and groove, as described.

No. 45,790.—THOMAS N. DAVEY, assignor to himself and THOMAS DAVEY, sr., Jeffersonville, Ind.—*Machine for cutting Chair Splints*.—January 3, 1865.—The object of this invention is to facilitate the process of cutting splints for chairs, &c., and it consists in a reciprocating bed upon which are holding-dogs to hold the stock, and, upon an adjustable cross-beam are attached, on either side, two horizontally adjustable plates, to which are attached sliding plates, and to these are hinged tool-carrying arms, so that, as the bed reciprocates, it carries the stock against the knife which cuts a splint, and when it reverses the direction the stock is brought in contact with a knife on the opposite side of the beam, which, in like manner, cuts another splint in the opposite direction to the first, and so continues till the stock is cut into splints.

Claim.—First, the reciprocating bed B, provided with the dogs c c' c'' c''', in combination with the endless belt C, with pin or stud g attached, and the slotted bar E at the under side of the bed in which the pin or stud works, substantially as and for the purpose specified.

Second, the beam J, with adjustable blocks K K, attached, the latter provided with the vertical sliding blocks L, having cutter bar or stocks M secured to them by hinges *g*, when said parts are used in connection with a reciprocating bed B, as and for the purpose specified.

Third, the means employed for automatically feeding the beam J, downward, to wit: the bent arm *b'*, rod S, rock-arm R, pawl *a'*, and ratchet *b*, in connection with the projection *a* on the bed E, all arranged substantially as set forth.

Fourth, the knives N N', attached to the bars or stocks M, in connection with the guard plates O, substantially as and for the purpose specified.

No. 45,791.—WILLIAM DELTON, assignor to himself, CHARLES W. BAKER, JAMES M. SHEEHAN, MICHAEL TOONEY, LAWRENCE R. FITZGERALD, and JAMES T. DERRICKSON, New York N. Y.—*Manufacture of Paper Stock*.—January 3, 1865.—This invention consists of a tank in which is a partition provided with a gate. In the smaller portion of the tank is a series of perforated steam pipes which radiate from a central pipe. In this portion of the tank the caustic alkaline solution is prepared by means of lime, steam being admitted through the perforated pipes in order to heat it and agitate it, after which it is allowed to flow into the larger portion by raising the gate. From this tank the alkaline solution is conveyed to another tank to operate on the fibrous material. The said tank is made with a perforated bottom, beneath which are steam pipes, by means of which the contents of the vat may be heated.

Claim.—First, the tank *a* partitioned off at *b*, and provided with the perforated steam pipes *c c*, for the purpose and as specified.

Second, boiling the vegetable fibre in the vegetable caustic alkaline solution when said vegetable material is sustained by a perforated bottom above heating pipes, as set forth.

Third, the treatment of vegetable fibre by an alkaline solution prepared in the manner and of the material set forth.

No. 45,792.—HENRY G. GLADDING, Providence, R. I., assignor to himself, W. COLEMAN & SONS, and JOSEPH RALPH.—*Drop Press*.—January 3, 1865; antedated June 20, 1863.—The hammers are elevated by means of a lifting strap passing between two revolving surfaces, which are made to gripe or release said strap at will. The necessary tension of the lifting strap is maintained by its being wound around a pulley, whose circumference exceeds the length of the strap. A spring serves to keep the strap taut during the rebound of the hammer, so that the strap may be seized and the rebound arrested. The ascent or descent of the hammer may be arrested at any point, or its velocity be accelerated or diminished, by means of a brake acting on the lifting strap. The guides are secured to the anvil, so that they are not disturbed by the blows or removal of the hammer. A vertically sliding punch removes the metal shape from the die.

Claim.—First, the combination and arrangement as set forth of the friction pulley D and the winding pulley G, with the strap of a drop-hammer, substantially as herein described, for the purpose specified.

Second, in combination with a suitable device for elevating a drop or hammer to any desired height at will, a spring force suitably arranged, acting with sufficient swiftness to take up any slackness in the lifting strap occasioned by the rebound of the hammer, substantially as herein shown and described, for the purpose specified.

Third, in combination with the lifting strap of a drop hammer, a break or stop, having a nipping or binding action, conveniently arranged with a hand lever or other suitable device, and operating substantially as herein shown and described, for the purpose specified.

Fourth, the peculiar manner herein shown and described of securing the guides to the anvil to effect the purpose set forth.

Fifth, constructing one of the guides with a movable piece, substantially as herein shown and described, for the purpose specified.

Sixth, the peculiar construction and arrangement herein shown and described of the hubs or heads S S S S, to effect the purpose set forth.

Seventh, in combination with the anvil and die of a drop press, the sliding punches and percussive lever K, arranged and operating substantially as herein shown and described, for the purpose specified.

No. 45,793.—JOSEPH FLEISCHMAN, New York, N. Y., assignor to himself and ALOES FLEISCHMAN, Olmutz, Austria.—*Process of Preparing Grain for Distillation*.—January 3, 1865.—This invention consists in adding carbonate of soda, or equivalent alkali, to the acid solution in which the corn is soaked, preparatory to distillation, in order to neutralize any sulphuric acid that may be carried over in the process of charging the water with sulphuric acid gas.

Claim.—The use of the method or process hereinbefore described of treating or preparing Indian corn and other cereals in the manufacture of alcohol and spirits, as an improvement upon Aloes Fleischman's patent of July 12, 1864, for a like purpose.

No. 45,794.—FRANKLIN L. HICKS, assignor to BENJAMIN and PHINEAS LAWRENCE, New York, N. Y.—*Inkstand*.—January 3, 1865.—This invention consists in the construction of an elastic bottom, with a cam-turning rod, so as to raise the ink to the cup when required.

Claim.—The combination of the elastic bottom of the inkstand with the turning rod and cam, for the purpose and as specified.

No. 45,795.—HENRY W. HOLLY, assignor to himself and JOHN T. FANNING, Norwich, Conn.—*Perpetual Calendars.*—January 3, 1865.—This invention consists of two rollers placed on a common shaft, and having an independent movement. Upon one of the cylinders are placed the names of the days of the week; on the other, the names of the days of the month, arranged in spiral lines. The calendar can be adjusted for each month by adjusting one cylinder, so that the day of the week on which the month commences comes opposite No. 1 on the other cylinder. The double rollers are supported in bearings in a paper-weight or inkstand, or any other article in use on a desk.

Claim.—The use of the rollers A B, marked as described, and applied to a common axle C, which has its bearings in suitable lugs rising from a paper-weight or in a pen rack, or other similar article, in the manner and for the purpose substantially as set forth.

No. 45,796.—HARRISON OGBORN, Richmond, Ind., assignor to himself and ALMOND T. CHAPIN, Paw-Paw, Mich.—*Fanning Mills and Grain Separators.*—January 3, 1865.—The features of novelty in this invention are too numerous to admit of a brief description as to their nature; but they are, in general terms, intended to adapt the machine to perform its work in an effectual manner, while tending to simplify the construction and reduce the cost of manufacture.

Claim.—First, the rocking support K, adapted to transmit motion to the shoe E, in the manner explained, and constituting a medium for preventing the existence of a counter current of air, thus increasing the efficiency of the operating current.

Second, supporting the shoe at its rear end by means of arms O, provided with elliptical or oblong apertures *o* fitting over screws or bolts having elongated heads *o'*, which admit of the ready adjustment of the arms O, as and for the purpose explained.

Third, the strip or flexible attachment P, for giving a vertical motion to the screw I, simultaneously with its reciprocating movement, substantially as described.

Fourth, the bearings I², when curved in such a way as to allow the arms *i'*, which they support, to be readily removed for adjustment, while preventing their accidental displacement, as herein set forth.

Fifth, the combined screw and grain board D D', arranged and employed in the manner and for the purposes specified.

Sixth, the deflectors or guides J J, for regulating the fan blast when the same are pivoted directly to the main frame of the machine (in contradistinction to being pivoted to the shoe) and adjusted by means of the catches *j* and holes *a*, in the manner and for the purpose explained.

Seventh, in combination with the doors Q, of the fan case, the slotted bar R *r* and pins or projections *q q*, arranged to operate substantially as and for the purpose described.

Eighth, the circular distributor C², employed to prevent the grain from accumulating at the centre of the screw D, substantially as and for the object specified.

Ninth, the grooves *d' d'*, in combination with the flange *f* of the screw F, said groove and flange admitting of the formation of a continuous conductor for the grain in both positions of the box D D' D'', substantially as explained.

No. 45,797.—JOSEPH RIDER, Newark, Ohio, assignor to himself and E. REMINGTON, Ilion, N. Y.—*Breech-loading Fire-arms.*—January 3, 1865.—The rotating breech piece is hung in the frame, working vertically and longitudinally, opening and closing the breech; the hammer is attached to the axis of the tumbler, and the latter firmly locks the breech piece before the hammer strikes the charge.

Claim.—First, the combination of the hammer, tumbler, and swinging breech piece, operating together, as and for the purpose substantially as described and represented.

Second, in combination with the tumbler, breech piece, and sear, the sear guard *e e* operating therewith, as and for the purpose substantially as described and represented.

No. 45,798.—THOMAS SWAN, Manlius, N. Y., assignor to himself, E. B. ALFORD, A. W. FIELD, and JAMES COBURN, Syracuse, N. Y.—*Reaping and Mowing Machines.*—January 3, 1865.—This invention relates to the means of imparting motion to the cutters, and will be readily understood from the claim and engraving.

Claim.—First, the wheel D, provided with teeth *e* carved at one side, as shown at I, in combination with two pallets E E', connected by the rod F, all arranged to operate substantially as and for the purpose herein set forth.

Second, the rock shaft J, provided with the pendant arm K, and operated through the medium of the arbor I and arm G, when said parts are used in combination with the wheel D, pallets E E', and rod F, and all arranged in the manner substantially as and for the purpose set forth.

Third, the elastic bumpers N N, in connection with the vibrating arm K, substantially as and for the purpose herein specified.

No. 45,799.—MARY P. WATERS, administratrix of W. E. WATERS, (deceased,) East Bend, Ky., assignor to AQUILA H. PICKERING, Salem, Iowa.—*Pumps*.—January 3, 1865.—A hollow piston rod moved vertically in a cylinder, in its descent receiving water from below, and in its ascent receiving water from above, the latter supplied from a transverse channel, beneath the main cylinder, through a narrow channel at one side thereof, communicating through an opening at the top of the septum. Within the piston a valve is set centrally upon bearings so as to guide the alternate currents into the hollow rod, with the alternating movements of the pump.

Claim.—In combination with the hollow piston shaft G, cylinder A, and side passage or pipe B, a piston E, so constructed that the water in both the up and down stroke will be forced centrally through the piston into the tubular shaft G, substantially as described.

Also, providing the piston E with the independent port frames I I' and the valve K moving between them, so as alternately to close each in the upward and downward strokes, substantially as herein specified.

Also, the special construction and arrangement of the piston as a whole, the same being provided with the induction passages *i i*, ports I I, valve K, and angular space *l*, substantially as described.

Also, in combination with the pump cylinder A, side passage or pipe B, and valves *g g' f f'*, the elongated passage D opening on one side upward by the mouth *h*, substantially as and for the purpose herein set forth.

No. 45,800.—GEORGE WOODS, Cambridge, Mass., assignor to MASON & HAMLIN, Boston, Mass.—*Musical Instrument*.—January 3, 1865.—This invention consists in a peculiar manner of coupling the keys, by which thirds, fifths, and octave notes may be played together.

Claim.—First, the wire coupler K, running diagonally from key to key of any chord, having bent arms, as described, one of which is operated upon by the key played, while the other operates the other key, under a mode of construction substantially as above set forth.

Second, the movable disconnected fulcrum bar *h*, constructed and operated substantially as described, to effect the construction and disconnection of the couples with the keys, as above set forth.

No. 45,801.—COSME GARCIA SAEZ, Madrid, Spain.—*Breech-loading Fire-arms*.—January 3, 1865.—The breech chamber, in which rotates the breech containing the charge, is the extension of the rear end of the barrel, or the barrel can be screwed into it. Although in one piece, its rear is open, but the jaws are in close proximity and are drawn together by a screw, operated by a lever on the top. When the faucet breech is in position for firing, the jaws are tightened, hugging the former more tightly, and making a gas-tight joint between the two. To load, the jaws are loosened and the breech turned back.

Claim.—First, forming the breech chamber, as described, of one piece, divided in the rear, so as to admit of contraction or expansion by the application of a suitable tightening device, as set forth.

Second, in combination with an expansible breech chamber, a new and actuating lever, constructed and arranged for operation for rendering the parts of the breech gas-tight, as set forth.

No. 45,802.—EDOUARD H. VITTECOQ, Beaumontel, France.—*Bolting Mill*.—January 3, 1865.—Coarse bran and crushed grain are introduced and caused to circulate freely within the bolt, so that the meal or flour is cooled and prevented from clogging the meshes of the bolting cloths. In this way cloths with very fine meshes may be employed, whereby the flour is more perfectly sifted. No tappets or beaters are made use of, and thus the injury which they cause to the cloth is avoided.

Claim.—The construction and arrangement of bolting mills, substantially as set forth, for operation in the manner and for the purpose described.

No. 45,803.—M. B. MASON, assignor to C. V. DE FOREST, AMOS HOWES, and GEORGE VAN DERBURGH, New York, N. Y.—*Method of Desulphurizing and Oxidizing Metallic Ores*.—January 3, 1865.—This invention relates to treating auriferous pyrites and other similar ores with the gases formed by decomposing steam, or superheated steam, by means of carbon or coal. The coal is placed in an ordinary fire-box, with grate bars, so as to allow a good draught of air to support combustion. Steam from a boiler, which may be heated by the waste gases of the furnace, is brought into the incandescent coal in the fire-box. The resulting gases are passed into the chamber containing the ore to be treated. For the purpose of regulating the temperature of the gases in the ore chamber, and to assist in oxidizing the metals, an additional supply of steam is passed into the ore chamber without being passed through the fire-box.

Claim.—Improved process for removing sulphur, arsenic, phosphorus, and antimony from auriferous or other metallic ores, and for oxidizing the said ores, by treatment of them with hydrogen and carbonic acid gases, substantially in the manner herein set forth.

Also, the admission of steam into the chamber wherein the metallic ores are heated, desulphurized, and oxidized, substantially in the manner and for the purpose herein set forth.

No. 45,804.—M. B. MASON, assignor to C. V. DE FOREST, AMOS HOWES, and GEORGE VAN DERBURGH, New York, N. Y.—*Furnace for Desulphurizing and Treating Auriferous and other Metallic Ores.*—January 3, 1865.—This invention consists of a furnace larger at the top than at the bottom, built over a combustion and gas-generating chamber. This combustion chamber is fitted with a grate and ash-pit, and is provided with one or more hollow perforated grate bars, or with equivalent pipes or tubes connected with a steam generator. The combustion chamber is formed by an arch, and extends through the walls of the ore chamber, its ends being furnished with doors and draught openings for the admission of air. The heat, gases, and air pass out of the combustion chamber directly into the ore chamber through a series of openings; and to prevent an excessive degree of heat in the ore chamber steam may be admitted through the passages. The ore is admitted through an opening in the top of the furnace, and is discharged through passages. The products of combustion pass out through openings into an encircling flue, and from thence into a suitable chimney, or they may be carried under a boiler, in order to utilize the waste heat.

Claim.—First, a fire chamber for generating gases by the decomposition of steam therein, substantially as described, arranged in combination with a separate chamber for containing and treating metallic ores, substantially in the manner and for the purpose herein set forth.

Second, the generation of gases by the decomposition of superheated steam within a suitable fire chamber, when said gases and like products of combustion in this fire chamber are conducted into and through a separate chamber containing metallic ores, for the purpose of desulphurizing and oxidizing said ores, substantially as herein set forth.

Third, when a fire chamber for generating gases is combined with a separate chamber for treating ores, substantially as hereinbefore described, I claim the introduction and use of steam in said ore chamber, for the purpose of preventing excessive heat therein, substantially as herein set forth.

No. 45,805.—JAMES ADAIR, Pittsburg, Penn.—*Lamps.*—January 10, 1865.—This invention consists in forming the points and opening in such a manner as to prevent the descent of the heat from the flame to the oil reservoir, the devices being designated in the claim and shown in the engraving.

Claim.—First, the construction of the screw *k i*, with a flattened spheroidal or lozenge-shaped chamber B about it, substantially in the manner and for the purpose described.

Second, making the spheroidal chamber of open work or perforated plates, substantially in the manner and for the purpose described.

Third, constructing the spheroidal or lozenge-shaped chamber of the cone *a* with a screw *d'*, box *e*, with tube and wick-adjuster, substantially in the manner and for the purpose described.

Fourth, the combination of two or more spheroidal or flattened chambers, substantially in the manner described.

Fifth, the combination of my specified insulator with a lamp, substantially in the manner and for the purpose described.

No. 45,806.—JOHN S. ADAMS, Taunton, Mass.—*Igniting Hand Grenades.*—January 10, 1865.—A friction or cannon primer is securely attached to the time-fuze inserted in the grenade, a hook which is attached to a strap secured to the wrist being inserted into a loop formed on the end of the wire of the friction primer after the grenade is taken into the hand. When the grenade is thrown the hook pulls out the wire of the friction primer just after the grenade leaves the hand, and thus ignites the time-fuze.

Claim.—The combination of the recess E, the metallic disk D, the hook slot F, the water-proof cap G, and the opening tape H, all arranged substantially as and for the purposes set forth.

No. 45,807.—W. D. AMENT, Muscatine, Iowa.—*Cultivator.*—January 10, 1865.—This invention relates to a block which is placed upon each of the standards supporting the shares. This block is secured by a pin, and is adjustable in regard to height, which thus regulates the depth of the ploughing.

Claim.—In combination with the standards D D, adapted to be operated by treadles so as to move the ploughs vertically and laterally, I claim the adjustable blocks G, resting upon the plates E, and employed to vary or regulate the depth to which the ploughs penetrate the ground, in the manner herein explained.

No. 45,808.—JONATHAN BALL, Elmira, N. Y.—*Machine for Manufacturing Cigars.*—January 10, 1865.—This invention consists in having a suitable table upon which is fixed a mould passing perpendicularly down through the leaf of the table. On the top of the mould is an adjustable cup or hopper, in which the tobacco is placed. On the back of the table is a post with a projection on the top, extending forward, through which is a wire extending to the bottom of the mould; this wire also passes through a follower that is used for pressing the tobacco into the mould.

Claim.—First, the use of a wire *c*, and tamper F, perforated through its longitudinal cen-

tre, as described, in combination with the mould *c*, or its equivalent, and with a suitable wrapper, constructed and operating substantially as and for the purpose herein described.

Second, the method, substantially as herein described, of introducing the filling of a cigar around a central wire, for the purpose of producing a central draught.

Third, manufacturing cigars by first inserting the wrapper into a mould and afterward filling in the tobacco, substantially as herein specified.

Fourth, in combination with a machine constructed as herein described, I claim the cup or funnel *G*, employed to hold the wrapper in position, and admit of the introduction of tobacco after the tamper is inserted, as explained.

No. 45,809.—JOHN BEST, Pittsburg, Penn.—*Manufacture of Glass*.—January 10, 1865.—This invention consists in making crystal glass by substituting coarse granular marble for the slaked lime generally used in the batch. The batch used in this invention consists of granular marble pulverized, clean sand, soda-ash, and nitrate of soda.

Claim.—The use of the ingredients hereinbefore described, which I call granular marble, as a substitute for slaked lime or oxide of lead, in combination with the other ingredients composing the batch or mix, as herein before specified, or some of them, or their equivalents, in the manufacture of crystal glass, substantially as herein before described.

No. 45,810.—JACOB W. BOPE, St. Louis, Mo.—*Harvesters*.—January 10, 1865.—This invention consists of two levers which radiate from movable centres, and are combined with segments upon the main frame in such a manner as to effect a perpendicular up and down motion of the finger-bar in front. In connection with the levers and the segments are used hinged stirrups for attaching and moving the finger-bar as required. The reel is raised and lowered by means of the levers extending under the shaft, and connected with the finger-bar, whereby the reel is kept equidistant from the cutting mechanism.

Claim.—First, the levers *D D*, radiating from movable centres, in combination with the segments arranged on the main frame, for effecting a perpendicular up and down motion of the finger-bar in front, as described.

Second, the combination of the levers *D*, the hinged stirrups *E*, and the segments *C*, for attaching and moving the finger-bar, in the manner described.

Third, raising and lowering the reel, by means of the levers extending under the shaft, and connected with the finger-bar, as described, whereby the reel is kept equidistant from the cutting mechanism, as herein set forth.

Fourth, the arrangement of the sliding friction roller *f*, on the lever arms *a a*, as and for the purpose herein described.

No. 45,811.—JACOB W. BOPE, St. Louis, Mo.—*Corn Harvesters*.—January 10, 1865.—This invention relates to the means for gathering the stalks, and for forming the gavel and discharging the same. Behind the cutter on each side is hinged a table, the rear edge of which is free to conform to the ground, which, with the lower part of a bent rod, forms the bed for the gavel, and an inclined standard is attached to the frame as a guide for the stalks to this bed. The aforesaid rod passes through a loop at the lower end of the guide, and is then bent upward to the upper part of the guide, to which it is pivoted, and is then bent inward over the frame and attached to a foot lever, the motion of which withdraws the lower part of the rod from under the gavel, which is then discharged.

Claim.—First, the sliding rod *f*, or its equivalent, provided with a foot lever, in combination with the guide *G* and hinged table *E*, substantially as and for the purposes specified.

Second, the reel *F*, provided with six or more straight arms, having one or more wires running through them, said wires crossing each other, or being bent to form such angles, that the stalks are gathered and discharged with ease and certainty, substantially as shown and described.

No. 45,812.—D. C. BREED, Lyndonville, N. Y.—*Coupling Thills to Carriages*.—January 10, 1865.—This invention consists in the use of an eccentric coupling bolt, so connected with the jaws that it cannot turn. The rattling of the bolt and its liability to get out of its place are thus avoided.

Claim.—The eccentric bolt *C*, provided with cams *a a*, in combination with the jaws *b b*, thill hook *d*, and packing *E*, substantially as and for the purpose herein set forth.

Also, securing the eccentric bolt in place, when thrown back, by means of the depression *g*, formed partially in the jaw and partly in the cam *a*, into which depression fits the rim *h* of the nut *G*, the whole arranged and operating substantially as and for the purpose herein specified.

No. 45,813.—WILLIAM BURNET, New York, N. Y.—*Paper File*.—January 10, 1865.—This invention consists of two plates of wood, one being longer than the other. They are held together by a metal loop and spring, which hold the papers by an equable pressure.

Claim.—A file made of two leaves secured together by a hinge bar and kept together by means of spring pressure thereon, all made and operating substantially as above described, or their mechanical equivalents.

No. 45,814.—BENAJAH J. BURNETT, Mount Vernon, N. Y.—*Ventilator*.—January 10, 1865.—This device is designed for roofs of houses, &c. The body is divided by intersecting partitions with four or any desirable number of chambers. At the top and bottom of the said chambers are deflectors; the first being inclined downwards, and the latter upwards. A wide overhanging cap covers the top, immediately under which, and opposite the upper deflectors, are narrow openings extending across all the chambers, and provided with hinged shutters, to which brackets are attached, so that they may be stopped in a downward inclined position if desired. The openings opposite the lower deflectors are below the roof.

Claim.—A ventilator composed of an upright trunk A divided into chambers *a a*, having openings *e f* above and below the roof, with opposite inclined deflectors *c d*, substantially as herein specified.

Also, the hinged shutters *g g*, with their attached brackets *h h* so applied in combination with the upper openings *ee* of a ventilator, of a construction, substantially as herein described, that when open the said shutters form deflectors to encourage the entrance of air into said openings, substantially as herein specified.

No. 45,815.—WILLIAM COX, Philadelphia, Penn.—*Car Springs*.—January 10, 1865.—This invention consists in applying wooden or steel springs, or both, to a railroad car in such a manner that the weight of the car is distributed or transmitted to the bearings of the axles from each end, and from the centre of the car at each side of the same.

Claim.—The tapering springs D D secured to the sills *b b* of a railroad-car truck, and resting upon lips *a a*, projecting from the journal bearing C, all being arranged to operate in the manner and for the purposes herein described.

No. 45,816.—LOUIS CRAMER, Brooklyn, N. Y.—*Spinning Top*.—January 10, 1865.—This invention relates to tops where a spring is used to give rotation, and in this case a notch in the lower end of a tube is used to hold the top, which has been wound up, until by pressure it may be disengaged simultaneously with the spring.

Claim.—A notch *e*, in the hollow arbor *b*, in combination with the ratchet teeth *g* on the barrel *c*, which encloses the spring *d*, and with the pin *f*, projecting from the shank of the top, constructed and operating substantially as and for the purpose set forth.

No. 45,817.—W. H. CRICHTON, La Porte, Ind.—*Seeding Machine*.—January 10, 1865.—In this invention rotating-pointed wheels are fixed upon the shaft in the seed box, between each of which wheels are inclined planes to carry the seed to the openings upon the rear side of the box. A perforated plate can be adjusted so as to register wholly or partially with the seed openings. These wheels are operated from the axle, and thrown out of gear by a hand lever at the driver's seat.

Claim.—The rotating-pointed wheels J, fitted on a shaft I within the seed box H, with double-inclined planes *c c* between them and the wheels, working in recesses *b* in the rear side of the seed box, in combination with the fixed perforated plate L and the adjustable perforated plate M at the rear of the seed box, all arranged substantially as and for the purpose set forth.

No. 45,818.—DAVID DECKER, New York, N. Y.—*Piano-fortes*.—January 10, 1865.—This invention consists in having agraffs for the treble strings made with their heads projecting to one side of the screw, thus giving a firmer hold in the wood.

Claim.—The construction of the agraff used in piano-fortes, substantially as herein described, whereby the face of its head, which is toward the hammers, may be flush with or project slightly beyond the edge or face of the wrest plank, while its screw is entirely enclosed in the wood of the said plank, and a sufficient supporting thickness of wood is left on the outer side of it to obviate the necessity of securing it into the iron plate.

No. 45,819.—J. FREDERICK DUBBER, Brooklyn, N. Y.—*Pocket-book*.—January 10, 1865.—This invention consists in providing the flap with a metal spring which keeps it closed, and retains the outer folds of the book in position.

Claim.—A pocket-book, provided with a strip of steel *d* in the edge of its closing flap *c*, as a new article of manufacture.

No. 45,820.—OSCAR T. EARLE, Springfield, Mass.—*Valves for Steam-engines*.—January 10, 1865.—The object of this invention is to so arrange the steam ports in conjunction with a plain cylindrical slide-valve, having one or more grooves or recesses, that the valve shall be perfectly balanced, and be actuated by the simple reciprocating motion obtained directly from the piston rod.

Its novelty consists in the ports I through the valve leading behind its ends into the steam chests, and, at proper intervals, coinciding with the ports of the valve seats. The arrangement of the parts K and K' with the ports I and I', valve E, ports F and F', with piston B and valve E.

Claim.—First, a cylindrical slide-valve, constructed with one or more ports through it, the said port or ports leading behind the ends of the valve into the steam chest, and at proper

intervals coinciding with ports of the valve seat, substantially as and for the purposes set forth.

Second, the arrangement of ports F and F' with piston B and valve F, when operating substantially in the manner and for the purposes herein described.

Third, the arrangement of the ports K and K' with the ports I and I' and valve E, when operating substantially as herein described.

No. 45,821.—CHARLES W. EMERY, Dorchester, Mass.—*Machine for Clipping Hair or Wool from Animals*.—January 10, 1865.—This invention consists in attaching to a circular cutting plate a series of shear blades by means of pivots, this circular plate having a cam annexed to it in which there is a zig-zag path in such a manner as to give a vibrating motion to the shear blades, and also in connection with this is a spring, pivoted to the back of the machine, for locking and unlocking the circular plate at proper intervals, so that it may remain at rest while the cut is being performed, and again revolve while the blades are open.

Claim.—First, a series of shear blades attached by pivots to a circular cutting plate in combination with a circular undulating path cam, formed in such a manner as to give a vibratory motion to the shear blades, substantially in the manner and for the purpose herein described.

Second, the device herein described for rotating the circular cutter plate, and locking and unlocking it at proper intervals, so that it may remain at rest while the cut is being performed, and again revolve while the blades are open, substantially as herein set forth.

No. 45,822.—SAMUEL L. FOX, Philadelphia, Penn.—*Tube Packing*.—January 10, 1865.—The object of this invention is to so arrange elastic material that tubes of oil and other wells or other surfaces, fixed or movable, may be packed by the expansion of its walls against a well or other external obstruction, and against a pump pipe or other inner obstruction, by means of a fluid being forced between the inner and outer walls of a flexible packing-box.

Its novelty consists of a packing case constructed with flexible sides, so as to pack tubes for oil wells or other purposes, and to render the packing-case movable and expansible.

Claim.—First, packing pump tubes of oil and other wells, or other tubes or pipes, by means of a movable packing case, with expansible sides, substantially as above described.

Second, the packing-case Q, constructed and operated substantially as above described.

No. 45,823.—DANIEL D. GITT, Arendtsville, Penn.—*Harvester*.—January 10, 1865.—This invention relates to the manner of applying a friction roller and its guiding box to the heel end of the cutting apparatus, and is explained by the claim.

Claim.—First, mounting the friction roller upon the pin which unites the connecting rod with the sickle, when the said roller occupies a central position in relation to both, as shown and described.

Second, in combination with the above, the employment of a box closed on top, for the double purpose of guiding and protecting the anti-friction connecting device, substantially in the manner described.

No. 45,824.—IRA HART, Clarksburg, W. Va.—*Head Blocks for Saw-mills*.—January 10, 1865.—The object of this invention is to simplify the devices for adjusting the log to the saw while on the head block, and it consists in a sliding-knee on which works a clamp that can be, by means of a lever attached to the shaft having a curved arm, connected with a link that is attached to the clamp and a spring catch, so that when the lever is operated the spring catch takes hold of and retains the clamp in such position in the knee that it will move the slide in either direction at the will of the operator.

Claim.—First, the sliding-knee B and clamp H in combination with the link G and shaft E, or their equivalents, when constructed substantially as and for the purpose specified.

Second, the combination of the clamp H, guide I, and spring M, when constructed substantially in the manner and for the purpose specified.

No. 45,825.—W. H. HARTMAN and SAMUEL SELLER, Fostoria, Ohio.—*Combined Seeding Machine, Roller, and Drag*.—January 10, 1865.—This invention consists in attaching a harrow to a seeding machine, so that the harrow will have a lateral motion imparted to it by means of a crank and pitman connected to the traction roller and harrow.

Claim.—The special arrangement of the jointed dray F, lever G, chains g h, in combination with the seeding apparatus and adjustable rollers B B, when arranged and operating as and for the purpose set forth.

No. 45,826.—S. ROSS HIGGINS, Parma, Mich.—*Hay Loading Machine*.—January 10, 1865.—The object of this invention is to provide a machine for loading hay upon wagons from cocks or windrows in the field. Upon a mounted frame is placed a turn-table, to which a long arm is hinged, said arm being provided with a fork which has a guard. The machine is so connected with the draught animal that it may be drawn from place to place, the fork lowered and adjusted to its work, and then raised with its load over the wagon and discharged, the labor being performed by the animal, while the attendant guides the machine by means of a caster wheel, and manipulates the parts.

Claim.—First, the turn-table G, placed on a mounted framing A and having a fork bar J connected to it, operated by means of a rope N under the action of the draught animal, substantially as and for the purpose set forth.

Second, the guard M, with its forward and rear bars U and L, and pivoted to the fork bar J, in combination with the pivoted fork K and the rope N, by tension, in which the guard is pressed down upon the hay, the whole arranged substantially as and for the purposes described.

Third, the caster wheel C, when used in combination with the framing A, turn-table G, fork bar J, and fork K, for the purpose described.

Fourth, the bar Q on the rope N, in connection with the notch o in the shaft H, and the rope R and spring S, for the purpose set forth.

No. 45,827.—OLIVER T. HOLBROOK, Rushville, N. Y.—*Reaping and Mowing Machine.*—January 10, 1865.—This invention is explained by the claim.

Claim.—First, the combination with the main frame c, constructed as described, of the secondary frame D and plate B, arranged and operating in the manner set forth.

Second, the cutters K, formed with a slit in the rear, as shown and described, when arranged upon and secured to the bar in the manner specified, whereby one part of the rear end thereof is elevated above the other, for the purpose and in the manner set forth.

No. 45,828.—EDWARD P. HUDSON, Washington, D. C.—*Manufacture of Steel.*—January 10, 1865.—This invention consists in decarbonizing iron by placing it in the puddling furnace and treating it as if it were to be converted into wrought iron. When the metal assumes the state of fine granular particles, it is exposed to a flame so regulated that it shall not oxidize the metal. When the decarbonization has been thus completed, the whole mass is removed from the furnace. The metal is then cooled and subjected to the action of stamps, in order to separate it from the cinder. The metal thus decarbonized is mixed with pig iron and melted.

Claim.—The manufacture of cast steel by combining decarbonized iron, prepared substantially as herein described, with pig or other carbonized iron, as herein specified.

No. 45,829.—SIDNEY HUDSON, Milford, Mich.—*Tallying Machines for Measured Grain.*—January 10, 1865.—The bottom of the box in which the grain is measured is of semicircular form, and closed by a swinging plate attached to a vertical bracket or plate pivoted at its upper part to the side of the box. By a crank movement this plate is moved back and forth, alternately closing the box and discharging the grain. A pawl upon the upper part of the bracket operates a ratchet wheel to give motion to a registering apparatus, such as have been before used.

Claim.—The combination and arrangement of the several parts which produce the result, in the simple, concise and effective form described.

First, the circular hopper slide L, as attached to oscillating plate B which works dog d, as described; also crank C, the journal of which passes through a slot in plate B, and is attached near the edge to ratchet R, which is held from turning back by dog S, which prevents slide L being closed without tallying, when the parts are arranged to operate as and for the purpose described. This combination will work several varieties of registers.

Second, the combination of the ratchet wheel E with cog wheel H, which works over the centre of E; also cog wheel x, which gears with H and works near the edge of E, one cog at a time extending beyond the edge of E, which, at every revolution of E, comes in contact with stop I, by which wheels x and H are moved forward one point on their respective dials.

Also spring D, which is used to keep the machinery in place, when arranged in combination as and for the purpose herein shown and described.

No. 45,830.—SAMUEL JACKSON, Philadelphia, Penn.—*Cartridges.*—January 10, 1865; antedated January 3, 1865.—This invention consists in having an exterior case with a tight joint, and a metal lining with a loose joint.

Claim.—The combined paper and metallic cartridge case, when constructed and arranged to operate substantially as set forth.

No. 45,831.—CHARLES JARVIS, Ellsworth, Maine.—*Root Cultivator and Weeder.*—January 10, 1865.—In this invention the front edges of the upright rectangular cutters are made to project beyond the horizontal blade, so as to divide the ground in advance, thereby leaving the rows or hills smoother. The cutters are inserted by their upper ends through a horizontal bar connected with the draught axle by arms, in the outer extremities of which the axle revolves.

Claim.—First, constructing the front edges n of the sides g g of the cutters G so as to project beyond the latter, substantially as and for the purpose described.

Second, the cutters G, arranged as described, in combination with the bar A, tongue B, and wheels F, substantially as and for the purpose specified.

No. 45,832.—FRANK G. JOHNSON, Brooklyn, N. Y.—*Bed Bottom.*—January 10, 1865.—This invention consists in applying the common cord to a simple rectangular frame in such a manner as to provide a desirable spring bottom for beds. The engraving will show the manner of cording.

Claim.—The peculiar manner in which the cord is laced into the frame A B C D, so that no two consecutive cords are parallel to each other, substantially in the manner and for the purposes herein set forth.

No. 45,833.—ADAM KECK, Montgomery, Ill.—*Cultivators*—January 10, 1865.—In this invention there are three leading features: first, in relation to the adjustment of the bearing wheels longitudinally, for the purpose of making the machine balance the driver when in the seat; second, in the attachment of the inner set of ploughs to a vibrating beam working upon a pin and placed transversely to the line of draught; third, connecting the outer plough beams with the adjusting plate for the wheels.

Claim.—First, the attaching of the axles C of the wheels B to plates D, secured to castings E at the under side of the framing A by means of bolts *a* passing through oblong slots *c* in the castings, substantially as shown and described, to admit of the wheels B being adjusted further forward or backward, to keep the machine in a proper equipoised state, as set forth.

Second, the plough beams G G, provided at their front ends with upright bars *g* connected by joints *h* to the castings E, and provided at their back ends with upright bars H, having each a notch *i* to receive a catch I, all arranged substantially as and for the purpose set forth.

Third, the springs K on the back part of the framing A, in combination with the upright bars H of the plough beams G G, as and for the purpose specified.

Fourth, the attaching of the plough beams L L by means of the uprights M and joints *j* to the pivoted plate N arranged on the framing A, substantially as shown, to admit of the working or moving of the ploughs Q, as set forth.

No. 45,834.—JOEL F. KEELER, Pittsburg, Penn.—*Mode of constructing Railroad Car-Trusses*.—January 10, 1865.—This invention consists in constructing the bottom or truss of a railroad car of sheet iron, with suitable bulk-heads connecting it with the trucks or running gear in such manner that the said bottom or truss will drop partly below the top of the wheels and between them, more especially at the middle of the car, thus affording space for holding a sufficient amount of liquids to nearly or quite freight the car, while about the usual space is left in the car for other articles above the truss.

Claim.—The railway car-truss, constructed and used substantially in the manner and for the purposes set forth.

No. 45,835.—GEORGE A. KEENE, Newburyport, Mass.—*Feathering Paddle-wheel*.—January 10, 1865.—The floats of this wheel turn on the spokes or radii of the wheel. There is a difference in the area or surface of the floats on the sides divided by their axis of motion, and hence are made to feather.

Claim.—Arranging the floats of a paddle-wheel in pairs at right angles to each other, one at each end of a shaft passing through the centre of the wheel, so as to present more area on one side of said shaft than on the other, in order that the one float, entering the water flatwise, in passing through the same shall gradually turn and emerge edgewise, while at the same time it is turning the opposite float so that it shall enter the water flatwise, substantially as described.

No. 45,836.—THOMAS KENNEDY, Branford, Conn.—*Securing the Necks to Door Knobs*.—January 10, 1865.—The knob, as is usual, has a cylindrical hole for the reception of the eye of the shank, but in this instance there are, on opposite sides of the hole, two narrow grooves which extend down to its bottom, and at the bottom of the hole these two grooves are intersected at right angles by a circular groove of the same width and depth. The eye of the shank has two spurs at its end corresponding to the two side grooves, and after the soft cement has been introduced into the hole, the eye is thrust in and down to the bottom of the hole and then turned partly around so that the two spurs shall lie in the concentric groove.

Claim.—Securing the neck to knobs substantially as and for the purpose herein set forth.

No. 45,837.—JOHN J. KIMBALL, Napierville, Ill.—*Treadles for operating Machinery*.—January 10, 1865.—This invention consists in constructing a treadle in such a manner that the weight of the operator will aid in operating it.

Claim.—The treadle D, hung centrally on a shaft *a*, provided with two pitmen C C, which are connected to reverse cranks B B on the shaft A, in combination with the foot piece E E, hung on shafts *b b*, which are fitted in the treadle, and all arranged to operate substantially as and for the purpose specified.

No. 45,838.—JAMES KLINE and VROOMAN BECKER, Chicago, Ill.—*Swinging Gear for Threshing Machine*.—January 10, 1865.—This invention relates to a method of communicating power to a threshing machine in such a manner that the machine may be moved as the wind changes, while the power remains stationary. It consists in the combination of a stationary hanger, two sleeves and a socket, and a movable hanger or stirrup, connected to the machine by a perforated adjustable plate.

Claim.—The combination of a stationary hanger with two sleeves and a socket, and a movable hanger or stirrup, with a perforated plate attached, and the hook, all combined and operating substantially as described.

No. 45,839.—DAVID LAKE, Smith's Landing, New Jersey.—*Fly Traps.*—January 10, 1865.—An angular wheel carrying the bait is made to revolve by clock work or other well known means, the bottom part always being in contact with the bait supply. A perforated hood covers about one quarter of the top and front of the wheel, and an insect passing under it on the wheel cannot get back. The lower front part of the wheel has a hinged lid or scraper always bearing against it, so that there can be no escape in that direction. An opening, however, is provided for the insect to pass into a front lighted box, which can be removed when desirable to destroy the swarm.

Claim.—First, the angular wheel A a', operating in connection with the cap D, and passage E, to conduct the flies in an undisturbed manner, to a point from which it will be impossible for them to regain their freedom, substantially as set forth.

Second, in combination with the aforesaid angular wheel, the circular trough G, adapted by its form to be readily inserted and removed, in the manner and for the purpose described.

Third, in combination with the said angular wheel, the pivoted gate H, weighted as and for the purpose described, and employed to cause the flies to leave the wheel A, and enter the receiver F, in the manner explained.

No. 45,840.—JAMES A. MACKEE, Boston, Mass.—*Dress Facing.*—January 10, 1865.—The facing consists of a strip of water-proof material and a strip of linen or other suitable cloth, sewed together at the edge, a piece of braid being sewed on the lower edge of the water-proof cloth which is first stitched to the hem of the skirt, the upper edge of the linen or other band being stitched to the dress a few inches above. The purpose is to protect the dress from the pucker and strain effected by a water-proof material sewed directly to it.

Claim.—The new manufacture or combination dress facing, as composed of the water-proof or enamelled cloth band, and the flexible linen band, or its equivalent, arranged and connected together in manner and to be used substantially as specified.

No. 45,841.—HOSEA LOW, Waukon, Iowa.—*Machine for cutting Sheet Metal.*—January 10, 1865.—This invention is intended for cutting sheets of metal at the proper angle at the sides and curve at the ends, to adapt them to the manufacture of pans, &c., and to cut out the circular pieces for the bottoms of the same. It cannot be intelligibly described in the space of a brief without reference to the drawings.

Claim.—First, the employment or use in machines for cutting sheet metal of two sets of cutters F F', arranged in one and the same oscillating frame E, or in two frames, the open ends of which point in the same direction, substantially as and for the purpose set forth.

Second, the combination of the cutter frame E, with the slotted shaft a, substantially as described, so that said frame can be lengthened and shortened from the centre.

Third, the combination of the central shaft a with the adjustable U-shaped standard D, and cutter frame E, and clamps H, substantially as set forth, so that the centre around which the cutters turn can be brought in any desired position in relation to the clamps.

Fourth, the radial sliding arms K K, applied in combination with the carriages I I, movable centre a, and cutter frame E, in the manner and for the purpose substantially as set forth.

Fifth, the employment or use of a slide M, carrying a pair of circular cutters i, and moving in rectilinear guides, substantially as described, for the purpose of cutting off bevels, as for squaring plates of sheet metal.

Sixth, the gauges L, applied in combination with the clamps H, substantially as described, and acting in the double capacity of gauges and of eccentric cams for compressing the clamps.

Seventh, the employment of the adjustable plate-holder N, in combination with the cutters F F', and cutter frame E, constructed and operating substantially as and for the purpose set forth.

No. 45,842.—JOHN B. MAHANA, Benson, Vt.—*Automatic Folding Gate.*—January 10, 1865.—This gate consists of bottom and top rails connected by pivoted slats. The centre pin of the hinges is placed in a horizontal position, and the upper hinge set further back upon the post than the lower one, so that the gate can be brought to a vertical position. By the operation of two cams and rods connecting with levers or bars, over which the wheels of the carriage pass on approaching the gate, the gate is thrown open, and a like operation closes the gate behind the carriage.

Claim.—First, the combination of the folding or rising and falling gate with the trippers D, for opening and closing the gate by the action of the wagon or other wheel in passing the gate, substantially in the manner and for the purposes set forth.

Second, the peculiar arrangement of eccentrics I, wires L, cords G G', and pulley H, for opening and closing the gate, substantially as described.

No. 45,843.—JOHN A. MASON, Brooklyn, New York.—*Ladies' Breast Pads*.—January 10, 1865.—The frame of this pad consists of a helical spring, the lowest coil or base of which is the base of the frame, the end of the wire being soldered to the side of this lowest coil at such point as may be selected with reference to the diameter of the pad. The spring is tied down to be covered within and without, each cover being secured around the base coil, the interior cover or lining being attached to the spring at the centre. When the cord holding the spring down is severed the pad assumes a dome-like form.

Claim.—The breast pads, constructed with the parts A, B, and C, substantially as above described.

No. 45,844.—JAMES A. MCGILLIRAE, Dyer, Ind.—*Presses*.—January 10, 1865.—This invention relates to a press for baling purposes, and of that class which is provided with a beater for compacting in the press-box the material to be acted upon previous to the pressing operation.

The invention consists in a means for operating the beater, and also in an improvement in the beater itself, as well as in the means employed for pressing the article after the beating operation has been performed.

Claim.—First, the employment or use of a cast-metal beater I, provided with holes *b*, to admit of the escape of air from the press-box, substantially as set forth.

Second, the trip wheel N, constructed and arranged substantially as shown, for operating the beater I, in combination with toothed wheels O and P, as described.

Third, the two levers E E, in combination with the inclined planes H H, for operating the follower F, substantially as set forth.

No. 45,845.—HARRISON B. MEECH, Fort Edward, N. Y.—*Rotary Boilers for the manufacture of Paper Pulp*.—January 10, 1865.—This invention consists in an improved arrangement of the pipes for introducing and withdrawing liquids from the boiler, and in an arrangement of the steam pipes so that they will not be clogged up by the pulp.

Claim.—First, the combination of the pipes *b' c c'* and *d'*, with their respective stop-cocks P N and O, with the pipe *a C* entering into the rotary Y Y, in the manner and for the purposes above described.

Second, the perforated cap B, in combination with the steam pipe *A a a*, passing out of the rotary through its journals *a'*, in the manner and for the purpose above described.

Third, the combination of the pipe *A a a*, the steam chamber K, the pipe *g'*, and the stop-cock M, in the manner and for the purpose above described.

No. 45,846.—JOHN M. MERRYMON, Indianapolis, Ind.—*Manufacture of Prussian Blue*.—January 10, 1865.—This invention consists in preparing Prussian blue by mixing a solution of prussiate of potash with a solution of bichromate of potash, and after stirring well, adding to it a solution of sulphate of iron until the proper color is produced. The color is then deepened by adding more of the solution of bichromate of potash, and sulphuric acid added to neutralize any potash remaining in solution. The Prussian blue can also be prepared by adding to a solution of prussiate of potash a solution of acetate of lead and a solution of bichromate of potash, and then adding the mixed solutions to a solution of sulphate of iron.

Claim.—The use of a solution of bichromate of potash and a solution of acetate of lead, in the manner and for the purposes herein described.

No. 45,847.—HENRY J. MILLER, Shanesville, Ohio.—*Saving Machines*.—January 10, 1865.—The object of this invention is to saw wood transversely, and it consists in the combination of the driving shaft, on which is a spur-gear wheel working in a pinion that turns the crank shaft, with the pitman attached to the same, working between two suspended cross-head guides, that can be adjusted perpendicularly by means of a shaft having pinions gearing into upright racks that support and adjust the guides.

Claim.—The combination of the shaft J, pinions *h i*, suspending racks H I, hangers D E, slideways *b c*, guides *d e*, cross-heads *l m*, and horizontal saw A, all arranged to operate as herein specified.

No. 45,848.—EDMUND MORRIS, Burlington, N. J.—*Fruit Box*.—January 10, 1865.—This invention consists in the construction of fruit boxes of thin veneer or any suitable kind of wood, pasteboard, or other material, and by means of a punch of proper size to cut out at one blow a strip long enough to form the four sides of the intended box, with a tongue at one end, which is fitted into a loop formed in one side of the box.

Claim.—The above described method of constructing fruit boxes without the use of nails or glue, whether made of wood or other material, and of whatever shape.

No. 45,849.—GEORGE M. MOWBRAY, Titusville, Penn.—*Ejectors for Oil Wells*.—January 10, 1865.—The object of this invention is to so arrange a series of devices that an eduction or blast pipe connected with an ejector of an oil well may be suspended, raised, lowered, or rotated at pleasure, whereby to correct the relative relations of the blast pipe with the eduction pipe, so as to deliver the blast of compressed air in such volume and at the precise distance which will produce the most effective result.

Its novelty consists in the frame constructed with one or more stuffing boxes to receive the tube connecting with the blast pipe; the collar *a* upon the tube A, screw B in combination with the female screw plate C and tube A, the hollow cap G in combination with the blast tube A, the combination of a T with the cap G, stuffing box D, and lugs to receive bolts *c c*.

Claim.—First, the frame constructed substantially as described, with one or more stuffing boxes to receive the tube connecting with the blast pipes, substantially as described and for the purposes set forth.

Second, the collar *a* forged upon or otherwise secured to the tube A, in combination with the hollow sleeve screw B, for the adjustment of the tube A, substantially as described and for the purposes herein specified.

Third, the hollow screw B and templet female screw plate C in combination with the tube A, substantially as and for the purposes described.

Fourth, the hollow cap G in combination with the blast tube A, substantially as described and for the purposes explained.

Fifth, the combination of a T fitted with a cap G, stuffing box D, and lugs to receive bolts *c c*, with templet and hollow screw, substantially as described and for the purposes set forth.

No. 45,850.—WILLIAM S. NICHOLSON, Providence, R. I.—*Machine for Forging File Blanks.*—January 10, 1865.—In this device the hammers or dies, four in number, are attached, with their faces towards each other, to the short arms of horizontal levers fulcrumed on the inside, each one respectively on the bottom, top, and two sides of a movable frame, and are operated by cams of suitable shape revolving on a horizontal shaft between their longer arms, which cause the hammers to give a succession of blows, while at the same time they are made to pass from heel to point of the file blank by a feed screw operated by a ratchet wheel and pawl, the movement of the latter being regulated to suit the amount of work to be done upon the different parts of the blank to be forged, which latter meanwhile remains stationary.

Claim.—First, swaging and shaping a file blank or similar article by the method and on the principle substantially as described.

Second, the method, substantially as described, of regulating and varying the rate of speed at which the devices for swaging the metal shall travel, by means of an irregular surface K moving with the swages, in combination with the mechanism by which such swages are moved, as herein specified.

No. 45,851.—A. B. NIMBS, Buffalo, N. Y.—*Elevators.*—January 10, 1865.—The nature of this invention relates to the construction of an elevator leg of wrought iron, the skeleton of the leg being formed of eight angle bars placed one at each corner of the back and front trunks, said angle bars being connected together by diagonal braces of flat bar iron, or by continuous plates of sheet iron, or both, riveted or bolted thereto, for the purpose of giving great strength and stiffness to the leg.

Claim.—A wrought-iron elevator leg, constructed of wrought-iron angle bars C, and connected and strengthened by wrought-iron diagonal braces D, or by sheet-iron plates L, the two trunks of the leg being connected at the top by the semicircular arches *c2 c3*, and at the bottom by the cast-iron foot box A, substantially as described.

No. 45,852.—JOSEPH W. NORCROSS, Middletown, Conn.—*Wire Fence.*—January 10, 1865.—This invention consists in a wire fence in which each section is constructed of one or more continuous pieces of wire extending over four sets of pulleys, two of which sets have their bearings on the end posts of the section, and the other two sets on adjustable posts in the middle, in such a manner that by moving said adjustable posts towards or from each other the tension of the wire is decreased or increased, and can thus be readily accommodated to the existing temperature; and furthermore, by using a continuous piece of wire the liability of the wire to break is materially reduced. The several strands of wire are supported and held parallel by brackets with oblique slots, cast or otherwise, rigidly attached to posts, which may be loose or fastened down to the ground. Before the wires are strained they can be easily introduced into the brackets, and by moving the movable posts an opportunity is obtained to force the wires apart when a person desires to pass through between them. The bearings of the pulleys are cast solid with the posts, so that the fence can be made cheap and durable.

Claim.—First, the use in the construction of a wire fence of one continuous piece of wire for each section, substantially as and for the purposes set forth.

Second, the pulleys *a b c d* attached to rigid posts *c c'*, and to movable posts D D', and operating in combination with the wire W and with the right and left handed screws or their equivalents, substantially as and for the purpose described.

Third, the brackets *g'*, with oblique slots *h*, applied to movable or rigid posts E, and operating in combination with the wire W, substantially as and for the purpose set forth.

Fourth, casting the bearings of the pulleys *a b c d* solid with the posts C C' D D', substantially as and for the purpose described.

No. 45,853.—G. H. NYE, Monmouth, Ill.—*Preparing Hay for Baling*.—January 10, 1865.—This invention consists in providing each end of each roller with flanges to confine the hay within the limits of the pressing surface.

Claim.—First, the rollers B C, when provided with flanges *c c*, substantially as and for the purpose herein specified.

Second, the combination of flanged crushing rollers B C, with the knives *g g*, substantially as and for the purpose set forth.

No. 45,854.—GEORGE PARR, Buffalo, N. Y.—*Manufacturing Screw-Drivers*.—January 10, 1865.—This invention consists in first rolling a sheet of steel of a width equal to the length of the screw-drivers to be cut from it, and somewhat thicker in the centre than upon either edge, and then cutting the screw-drivers from said plate by means of dies.

Claim.—Manufacturing screw-driver blanks or blades and other similar tools by the process substantially as herein described.

No. 45,855.—GEORGE T. PARRY and WILLIAM S. WARNER, Philadelphia, Penn.—*Method of Preventing Oil Barrels, &c., from Leaking*.—January 10, 1865.—This invention consists in saturating the staves of the barrels with paraffine by placing them in an air-tight vessel, exhausting the air, and then allowing the paraffine, in a fluid state, to flow in.

Claim.—The employment of paraffine to prevent leakage from barrels and other vessels or wood.

No. 45,856.—TOWNSEND POORE, Scranton, Penn.—*Water Gauges for Steam Generators*.—January 10, 1865.—The object of this invention is to so arrange its details that the height of water in a steam generator may at all times be manifested, whereby the danger of explosion may, to a considerable extent, be averted. Its novelty consists in the combination and arrangement of the cock, plug, tail stock, pipe, index hand, perforated vessel, and the cup of the discharge pipe.

Claim.—First, the arrangement, consisting of the cock F, plug G *c*, flanged tail stock C, segment pipe D, and index hand *g*, the whole being combined and fitted to the boiler substantially as and for the purposes herein described.

Second, so fitting the several parts of the apparatus together and to the boiler that the one plug G *c* answers the two-fold purpose of opening or closing the cock F, and of twining the segment pipe C D to any position desired, in the manner herein described.

Third, the application of a hollow perforated vessel H to the hollow drain-pipe of a try-cock, substantially as described.

Fourth, the application of a cup K to the inner end of the discharge pipe D, for determining the height of water in the boiler when there is no pressure therein, substantially as described.

No. 45,857.—HENRY PREUSS, New York, N. Y.—*Composition for Lining Barrels, &c.*—January 10, 1865.—This invention consists of a composition of glue, alum, litharge, and chloride of lime. The glue is first dissolved in water, and the solution heated to near the boiling point; the alum is then added in small pieces, and the mixture well stirred: the litharge is then dissolved in water and added to the mixture, the whole being continually stirred to prevent the litharge from sinking to the bottom.

Claim.—A composition produced by combining litharge with glue, or its equivalent, with or without other materials, for lining barrels or other packages of oil.

No. 45,858.—FITCH RAYMOND and AUGUST MILLER, Cleveland, Ohio.—*Fence Gates*.—January 10, 1865.—In this invention a grooved wheel is attached to the hinged end of the gate in such a manner that the centre of the wheel is perpendicular to the hinges of the gate. The wheel is placed in a horizontal position, and encircles the gate post to which the hinges are attached. A weight is suspended from the edge of the wheel furthest from the gate by means of a cord, which is supported on each side by a pulley. In opening the gate in either direction the weight is raised, the gravity of which will close the gate when the force which opened it is removed.

Claim.—The arrangement of the ring or hoop D, with the groove *f* and gate A, in combination with the rollers *e e*, cord *d*, and weight, when operating conjointly as and for the purpose set forth.

No. 45,859.—OLIVER P. REEVE, Tipton, Iowa.—*Beehives*.—January 10, 1865.—This invention relates to the construction and arrangement of several parts of the hive identified by the claim.

Claim.—The arrangement of the comb frame and comb guides, constructed as described, in combination with the groove *i* in the side of the hive and the double inclined bottom, substantially as and for the purposes specified.

No. 45,860.—CYRUS ROBERTS, Three Rivers, Mich.—*Cultivator*.—January 10, 1865.—The main frame, shifting plough frame, lifting lever, shifting mechanism, and driver's seat are so combined that the driver when on his seat can raise or lower the ploughs, or shift them,

laterally, without releasing his grasp upon the reins. With the shifting frame is combined a foot lever acting like a tiller, to enable the driver to shift the ploughs. The main frame, shifting frame, ploughs, and corn guard are so combined that they all vibrate on a common centre between the wheels.

Claim.—First, the combination of the main frame, the shifting plough frame, the lifting lever, and the shifting machine arm O P, with the driver's seat, when arranged for joint operation as described.

Second, the shifting foot lever R, constructed and arranged to operate as and for the purposes described.

Third, the combination of the shifting frame, the ploughs, and the corn guard with the main frame when constructed and arranged in operating as described for the purposes set forth.

No. 45,861.—CYRUS ROBERTS, Three Rivers, Mich.—*Cultivator*.—January 10, 1865.—The shovels are attached to their stocks by means of swivelling brackets, in order that they may be adjusted at various angles to throw earth upon or away from the crop. The shovel stocks are attached to the frame by means of brackets, pins or bolts, and clips, so as to secure a strong and yet free attachment. The shovels are mounted in pairs in an auxiliary frame arranged above the axles, and having both a vertical and lateral movement, the ploughs being all hinged on a common centre and playing between the wheels. The brackets to which the shovel stocks are pivoted are connected with the shifting frames by set screws and slots, so that the distance between each pair of shovels may be varied without changing the other parts of the mechanism.

Claim.—First, the combination of the double-ended shovels with their stocks, by means of the reversible swivelling brackets *e*, and bolts *c*, in the manner described, for the purpose of reversing the shovels when worn or injured, and of turning them sidewise to throw the earth more or less towards or from the plants as desired.

Second, the combination of the shovel stocks and shifting frame by means of the brackets J, bolts *j*3, and clips *j*4, as described, for purposes set forth.

Third, the combination of the shovels, the auxiliary or shifting frame, and the main frame, when constructed and arranged as described, for the purposes set forth.

Fourth, the combination of the plough stocks and shifting frame by means of the brackets J, slots *j*', and set screw *j*, as and for the purposes described.

No. 45,862.—H. C. ROBINSON, Monmouth, Ill.—*Feeding Corn to Corn Shellers*.—January 10, 1865.—This invention consists of a bin containing compartments, with the bottom inclined to the centre, underneath which is an endless belt that carries the corn to the mouth or hopper of the corn sheller.

Claim.—The employment or use of an endless apron or carrier in connection with a crib or corn receptacle, provided with removable slats or boards *d*, at its bottom, substantially as and for the purpose herein set forth.

Also, a crib or corn receptacle divided into a series of compartments and provided with a well hole, arranged as shown, when used in connection with the endless apron or carrier and the removable slats, substantially as described.

Also, the arrangement of the endless apron or carrier E, with the bottom *i*, of the box F, and the spout G, for the purpose of carrying off the loose or shelled corn as set forth.

No. 45,863.—CHARLES H. ROBINSON, Bath, Me.—*Baling Press*.—January 10, 1865.—This invention consists in an arrangement of levers, arms, and a windlass, whereby a very simple and efficient means is obtained for operating the follower of a press box, and one which will work with little friction.

Claim.—The combination of the levers C, bars D, ropes F, and shaft E, all arranged and applied to the follower B, to operate in the manner substantially as and for the purpose herein set forth.

No. 45,864.—CHARLES D. ROGERS, Utica, N. Y.—*Shifting Gear*.—January 10, 1865.—This invention relates to a means whereby the pinion which gears into the large spur wheel of reaping and mowing machines may be moved or adjusted so as to render the long or crank shaft, and consequently the sickle, operative and inoperative as desired. The object of the invention is to obtain a means which will operate without subjecting any of the working parts to undue strain, jars, or concussions, and one which will be self-locking and simple in its construction and arrangement.

Claim.—The lever I, with cam J attached, provided with two notches *f f'*, in combination with slide E, connected with the pinion C, and provided with the pin K and the sleeve H, provided with the pin K', and arranged with the spiral spring G, all arranged to operate in the manner substantially as and for the purpose specified.

Also, the lever I and cam J, in combination with the slide E, provided with two pins K K', either or both being fixed or movable, when said pins are arranged so as to engage with or lock into the notches *f f'*, as set forth.

Also, the flange L, provided with the slot *i*, when arranged in relation with the box M, substantially as and for the purpose specified.

No. 45,865.—SEYMOUR ROGERS, Pittsburg, Penn.—*Loading and Unloading Hay Wagons, &c.*—January 10, 1865.—This invention has for its object facility in loading and unloading hay, &c., and also securing the load upon the wagon. This is attained by making the upright at the rear end of the wagon jointed, and attaching to it an arm by means of a joint, so that the upright and its arm may be folded over the load and secured by a rope or chain at the rear end of the wagon.

Claim.—The turning upright B, placed at the rear part of the wagon and composed of two parts *a, b*, connected by a joint in combination with the windlass E, arm D and rope or chain F, all arranged to operate substantially as and for the purpose herein set forth.

Also, the same device for binding hay on the wagon, in combination with windlass H.

No. 45,866.—E. H. SAWYERS, Orleans, Iowa.—*Cultivators.*—January 10, 1865.—This invention consists in the arrangement of a lever and slot to communicate a side motion to the cultivator. By means of an angular shaft and rod, the draught is transmitted to the rear and heavier part of the machine.

Claim.—First, in combination with the lever L' and shaft L, the oblong slot *i*, formed and employed in the manner and for the purpose specified.

Second, the described arrangement of the adjustable cultivator frame I I', I2 I3, the brace rods *h*, angular shaft M and draught rod N, the whole being employed in the manner and for the purposes set forth.

No. 45,867.—AUGUSTUS W. SCHARIT, St. Louis, Mo.—*Device for Producing Motive Power by the vertical rise and fall of the Tide.*—January 10, 1865.—This invention consists in the combination of a float, with a screw and valves for filling the float with water. The float consists of a rectangular box made water-tight, and provided with valves for the admission of water when the float has reached its highest point. To the float a nut is attached which works upon the screw, and imparts thereto a rotary motion which is communicated to the machinery to be driven by means of bevel gears, one of which is attached to the top of the screw. A continuous motion in one direction is secured by a ratchet and pawl, which are attached to the horizontal shaft that is placed directly over the centre of the screw. Modifications of this device have double racks working in pinions for communicating power and a single rack for the same purpose, and another with ropes or chains working on pulleys.

Claim.—First, the combination of a float, screw shaft and the valve or valves for fitting and emptying the same, substantially as shown and described.

Second, the combination of a float with the double rack for communicating the power, substantially as shown and described.

Third, the combination of a float with the single movable rack for communicating power, substantially as shown and described.

Fourth, the double-sided valves substantially as shown and described.

Fifth, the combination of the screw cog-wheels, ratchets, and pawls, substantially as shown and described.

Sixth, the combination of the single rack and double ratchets and pawls, substantially as shown and described.

Seventh, the arrangement of the double or twin pairs of ratchets and pawls, substantially as shown and described.

Eighth, the combination of the double rack and wheels with the lever and screw and slotted rod and screw attached to frame guide, substantially as shown and described.

Ninth, the endless-chain pulley, drum, or windlass, in combination with the endless band or chain rods, hooks, pulleys, beam, and hinged drop, substantially as shown and described for loading and unloading vessels and for other purposes.

No. 45,868.—R. SCHMITZ, Brooklyn, N. Y.—*Billiard Indicator.*—January 10, 1865.—The object of this invention is to protect the proprietors of billiard saloons, by compelling the players to complete each game without the power to prolong it, the indicators being so constructed as to forbid removal backwards.

Claim.—First, the notched shaft E, in combination with the slide C, cam rods *i i*, index *e*, and scale *a*, constructed and operating substantially as and for the purpose set forth.

Second, the cam rods *i i*, in combination with the notched shaft E, slide C, and spring catch *f*, constructed and operating in the manner and for the purpose substantially as described.

Third, the swinging bar *m* and cam *l*, in combination with the slide C and registering device *v u*, constructed and operating substantially as and for the purpose specified.

No. 45,869.—JOHN SHEFFIELD, Pultneyville, N. Y.—*Drills for Boring Wells.*—January 10, 1865.—This invention has for its object the construction of a drill that will be capable of enlarging the shaft of an artesian well at its bottom. The invention is more especially designed for enlarging the bottoms of oil wells, so as to open more veins than the ordinary shaft will intersect.

Claim.—A drill for artesian wells, composed of the chisel bars C D and bent or oblique arm B of the drill rod A, connected together by pivots, and arranged substantially as and for the purpose herein set forth.

No. 45,870.—S. T. SHELLEY, Louisville, Ky.—*Railroad Axle Boxes*.—January 10, 1865.—This invention consists in a new mode of fastening a cover to an axle box, by means of a cam-joint hinge and a reciprocating spring bolt, so that the cover is securely held by the spring, whether open or closed.

Claim.—First, hinging the covers of axle boxes by means of a cam-joint hinge, constructed substantially as described, working on a reciprocating spring bolt, or its equivalent.

Second, making an enlargement *e* in the hinge A, for receiving the bolt head and spring *f*, in combination with the reciprocating bolt C and hinge A, for the purpose of protecting the spring and bolt from dirt and other obstructions, substantially as described.

No. 45,871.—SIDNEY SKILLMAN, Jersey City, N. J.—*Railroad Cars*.—January 10, 1865.—The object of this invention is to enable the engine and boiler of a locomotive car to be disconnected and run out therefrom whenever it becomes necessary so to do. This object is accomplished by having the engine and boiler independent of the car body, and attached to a truck. The invention consists in a novel construction of the car body, whereby, with a suitable arrangement of the engine and boiler upon the truck, the disconnection and running away of the truck, engine, and boiler from the car body are facilitated. It also consists in attaching the smoke pipe permanently to such a car, and making it detachable from the boiler, to facilitate the running out of the boiler from the car with the engine and truck.

Claim.—First, in combination with the placing of the boiler and engine of a locomotive car on a truck in such manner that the boiler is received within a compartment at one end of the car, the construction of the car with such an opening in the bottom or floor, and a door or other suitable opening in one end, as to permit the boiler to pass out with the truck when the latter is run out from under the car, substantially as herein described.

Second, the stationary platforms arranged within the car body and in relation to the boiler and truck D, substantially as herein described, to serve as standing places for the engineer, and as a protection against injury in case of getting off the track.

Third, in a locomotive car, having the engine and boiler detachable, attaching the smoke pipe permanently to the car, substantially as and for the purpose herein described.

No. 45,872.—C. V. STATLER, Wataga, Ill.—*Device for Shrinking Tire*.—January 10, 1865.—In this device the jaws are supported in upright standards, one of which is pivoted at the middle in a slot in one end of the frame, the other allowed to slide horizontally in a similar slot at the other end, both being connected by bars at the lower ends. By this arrangement, operating a cam behind the sliding standard forces it inward, while the connecting bars, moving therewith, operate the lower end of the pivoted standard, and cause the two jaws to approach each other.

Claim.—Two bars B C, one, B, fitted in the bed A by a pivot bolt *c*, and the other, C, arranged so as to slide therein, and the two bars connected at their lower ends by one or more bars D, and provided above the bed with the dies *f f*, in combination with the clamps F F, pivoted to the bars B C, the spring E, and lever J, provided with the cam K, all arranged to operate in the manner substantially as and for the purpose set forth.

No. 45,873.—D. D. STELLE, New Brunswick, N. Y.—*Weighing Buckets*.—January 10, 1865; antedated November 14, 1862.—One or more weighing devices are combined with the bucket and bail, so that when the former is suspended from the latter the weight of its contents may be ascertained simply by observing the weighing attachments. The bottom of the bucket is provided with one or more curved springs and a spring stop, so that, by withdrawing the latter, the weight of the bucket's contents forces the bottom open and the contents are discharged, whereupon the spring closes the bottom again.

Claim.—First, the weighing attachment *b c*, or its equivalent, in combination with the bucket A and its bail B, constructed and operating substantially in the manner and for the purpose described.

Second, the arrangement of springs *i* and spring stop *g*, in combination with the hinged bottom D of the bucket A, as and for the purposes specified.

Third, the arrangement of the rings R and Q guiding the string P, as described within.

No. 45,874.—JUDD STEVENS, Marengo, N. Y.—*Sleds*.—January 10, 1865.—This invention relates to "bob-sleds," and consists in so connecting the two bobs that each can have a degree of independent action, adapting themselves to inequalities in the road. The invention is limited to a specific combination and arrangement.

Claim.—Connecting the bolster C with the way *a*, by means of the rounded bearing *c* fitting in the depression *b*, for the purpose of allowing a free turning or oscillating movement of the bob, and employing the friction rollers *d f* to obviate the friction in the end movement of the bob in adapting itself to an irregular surface, the whole arranged, combined, and operating substantially as herein set forth.

No. 45,875.—ROBERT STEWART, Fultonham, N. Y.—*Water Wheel*.—January 10, 1865.—The object of this invention is to cause the water to act both by impact or percussion and reaction, which is attained by a peculiar form of the buckets and their mode of attachment

to the wheel. The novelty consists in forming the buckets with their oblique and inclined surfaces attached to the case with the bands in connection with the scroll.

Claim.—The buckets *d*, having the vertical, transverse, oblique, and inclined surfaces *e f f*, and attached to the case *b*, with the bands *h h* encompassing the inclined surfaces *f f*, in connection with the scroll *A*, all arranged substantially as set forth.

No. 45,876.—IGNATIUS STOFFEL, Washington, D. C.—*Artificial Arms*.—January 10, 1865.—In this invention the object of the trigger used in connection with ratchet bar and trigger spring is to enable the arm to be bent without operating the fingers when either closed or open. By pressing down the trigger the forked lever is disengaged from the sliding rod, thus allowing the arm to be bent without operating the fingers. In case the fingers are closed, the pressure of the projection on the ratchet bar holds the fingers in a bent position.

Claim.—First, the peculiar construction of the artificial hand and wrist joint, the palmar region of which is represented by a hollow metallic case with an elastic palm; the phalanges *t t t*, *t' t' t'*, and *t'' t'' t''*, operated by the springs *p p p p*, representing the four tendons of the flexor profundus, and articulated by the guide rings *u u u u*, representing the tendinous bands at the corresponding places of the natural hand; also, the hinged thumb and the thumb lever *g*, representing the flexor brevis pollicis, in combination with the stirrup *l* and the spring *m*, by which arrangement the elasticity of the cartilages of the natural hand is secured, as described within.

Second, the peculiar construction of rod *i* and ratchet bar *K*, in combination with the fork lever *a* fastened to the elbow, and the construction and arrangement of the trigger *d* with catch *e* and trigger spring *f*, as specified and for the purpose set forth.

No. 45,877.—CHARLES H. STRATTON, Munroetown, Penn.—*Digging Machine*.—January 10, 1865.—This invention consists of a machine for spading the earth, with steam as a motor, which object is accomplished by the use of spades or forks, of any suitable or desired numbers, arranged in such a manner that, as the machine is drawn along, they will penetrate the earth and lift and turn over the same in a manner similar to that of hand digging.

Claim.—The employment or use, in a steam digging machine, of a series of spades arranged in such a manner as to penetrate the earth, rise or swing upward with their load, and then turn one-quarter of a revolution to discharge the same, substantially as herein shown and described.

Also, the slots *g* in the shafts *F F*, having spiral outer ends *h*, in connection with pins *i'*, fitted in the bearings *e*, and passing into the slots *g*, the shaft *G*, to which the bearings *e* are attached, and the crank shaft *B*, all being arranged to operate the spades *E E'*, as set forth.

No. 45,878.—WILLIAM A. SWEET, Syracuse, N. Y.—*Ovens for Converting Iron into Steel*.—January 10, 1865.—This invention consists of a converting chamber, the sides of which are of a thickness of one width of fire-brick, the bottom of the chamber being formed of fire-bricks set on edge, or of two thicknesses of fire-brick. The bottom rests upon two thicknesses of fire-brick laid in such a manner that openings will be left between the chamber and its foundation. The furnaces and grates extend along each side of the base of the converting chamber, and from end to end of the oven, leaving an opening at each end for the admission of fuel. A longitudinal line of fire-brick prevents the draught from passing from one furnace to the other. The outer walls of the furnace are made perpendicular from the base to the boshes, the boshes being on a level with the spaces, and designed to project the heat into them. Above the boshes the walls are made to incline inwards in order to confine the heat more closely to the sides of the converting chamber. At the top the spaces communicate with the interior of the converting chamber by means of holes which are made smaller towards the centre of the chamber than at the ends. The interior of the fire chamber is connected with a flue by means of passages, which are also made smaller at the centre of the chamber near the flue than at the ends.

Claim.—First, the combination and arrangement of the heating furnaces with the converting chamber *A*, substantially as described.

Second, the dead-holes *H*, in combination with the heating furnaces and chamber *A*.

Third, the boshes or angular projections *m m*, as related to the bottom of the chamber *A* and the dead-holes *H*.

Fourth, gradually diminishing the fire spaces *S S* from the boshes *m m*, to the openings *o o* at the top of the chamber *A*.

Fifth, the openings *o o o o o*, *p p p p*, substantially as described and for the purposes set forth.

Sixth, supporting the upper edges of the chamber wall from external pressure, substantially as described and for the purposes set forth.

No. 45,879.—GEORGE B. TAYLOR, Worcester, Mass.—*Manufacturing Cutter-bars for Hydrating Machines*.—January 10, 1865.—The pattern bar in this apparatus corresponds, in its general form and dimension, as also in an eye formed upon one of its ends, to the cutter bar, but has projecting upwards, near one edge, a series of teeth, separated from each other by spaces equal to the spaces which should separate the holes in the cutter-bar, and has attached to it, near the end opposite to that on which the eye is formed, a loop or stirrup for

confining one end of the cutter-bar. In practice, the tapered extremity of the bar to be punched is passed through the loop, its edge abutting against the edge of the pattern, and is driven endwise until the eyes of the cutter-bar and pattern come in line with each other, when a bolt is passed through said eyes, and the two bars are thus, at that end, held immovably fixed to each other. Thus united, they are placed upon the table of the punching machine, a pawl depending from a stud on an adjacent part of the frame taking into the rack determines the distance which the bars must be moved upon the table for each successive hole. The series of holes are punched one after the other, beginning with the one nearest the eye, so that the elongation of the bar due to the operation of punching will be in the direction of the free end of the cutter-bar.

Claim.—Forming the holes for the rivets or bolts, by which the cutters are fastened to the cutter-bars in reaping and mowing machines by punching, in combination with holding the cutter-bar during the operation, so that it cannot elongate in the direction of the heel of the bar, for the purposes herein set forth.

Also, the use of the combined pattern and supporting bar B, as shown and described, to aid in the operation of punching cutter-bars, substantially in the manner herein described.

Also, in combination with the pattern or supporting bar B, the bolt *d*, and stay clamps C, for holding the cutter-bar, substantially as herein set forth.

No. 45,880.—SAMUEL E. TOMPKINS, Newark, N. J.—*Harness Saddle-trees*.—January 10, 1865.—This invention relates to harness saddle-trees made of iron and provided with iron jockeys, and consists in doing away with nuts and other projections on the under side of the tree, and in having the bearings of the tree so constructed that they serve the double function of bearings and clamps.

Claim.—The two bearings A A, connected together by a thin strip or plate B, made of convex form at their under sides to correspond to the shape of the back of the animal, and having a corresponding concave surface at their upper sides, when said bearings thus formed, and connected together are provided with nuts *a* at their upper surfaces to receive the turret screws *b*, and all used in connection with the metal jockeys E E, flaps C, and back-board F, substantially as herein set forth.

No. 45,881.—GEORGE VANDER HEYDEN, Troy, N. Y.—*Stove Grate*.—January 10, 1865.—In this invention a rectangular cast-iron grate is made to rest on a bed plate of the same shape and material in such a manner that it is susceptible of a horizontal reciprocal motion to free it from ashes, &c., and also of a rotary motion when it becomes desirable to dump the grate, or empty its contents; in order to attain these movements with more ease and convenience, a shaker handle of peculiar construction is provided. The grate is also lined with fire-brick, which is kept in place by a mortise and tenon joint.

Claim.—First, the bed plate B when constructed respectively at each end of said plate, with the direct bearings *a a* and reverse bearings *b b*, in the manner substantially as herein shown, for the purpose of supporting and operating stove grates, in the manner herein set forth.

Second, in combination with the bed plate B the fire grate C, when constructed substantially in the manner as herein described and shown, so that the said grate can be operated in combination with said bed plate, fully in the manner and for the purposes as herein specified.

No. 45,882.—NATHAN VARS, New Market, N. J.—*Side-hill Ploughs*.—January 10, 1865.—This invention consists in attaching a subsoil share to the rear of a side-hill plough; this share is attached to a reversible standard and admits of adjustment to either side of the plough-beam. The depth of the subsoil share is varied by a slot and set-screw in the standard.

Claim.—The employment or use in a side-hill plough of a subsoil share G, having its standard F attached to an adjustable or swinging arm G*, arranged substantially as shown, to admit of the subsoil share being adjusted to either side of the plough-beam, to suit the position of the mouldboard C and share D, as set forth.

No. 45,883.—GEORGE W. WALKER, Boston, Mass.—*Stove Grate*.—January 10, 1865.—This invention consists of a rectangular grate, susceptible of a lateral reciprocating movement, and can also be dumped to clear out the ashes, being hinged at its rear part for that purpose. A shaker handle of peculiar construction is fitted to the front part, by which the grate is shaken; it also serves to hold the grate up in a horizontal position, and is withdrawn when it becomes necessary to dump the grate.

The last bar on each side of the grate is made so wide as to effectually prevent the cinders jamming the grate.

Claim.—A stove grate having capabilities both of horizontal reciprocation, and of vertical swinging movement, when the grate is hung at its rear side to allow these movements, substantially as set forth.

Also, in a grate so constructed, giving to each end bar of the grate such width and disposition that in its sliding movement under the stove lining, the capability of free movement of the grate is maintained, substantially as described.

No. 45,884.—SYLVENUS WALKER, Boston, Mass.—*Pen-holder*.—January 10, 1865; ante-dated September 11, 1863.—The pen-holder consists of a glass tube closed at one end and coated upon the inside with silver, so as to be a non-conductor of electricity, for the purpose of preventing that paralysis, nervousness, &c., which sometimes follows the use of steel pens with conducting handles.

Claim.—The hollow silvered glass pen-holder, sealed up and protected as and for the purposes set forth, as a new and highly ornamental manufacture.

No. 45,885.—SAMUEL JACOB WALLACE, Carthage, Ill.—*Grain Binder*.—January 10, 1865.—This invention relates to the manner of arranging the binding devices in connection with the movable arm which rakes or gathers the grain upon the platform into gavels, and to the means for imparting the necessary motions to said devices.

Claim.—First, the arm Z of wheel O, sliding over slot of wire holder Y, substantially as and for the purpose specified.

Second, the binder G in combination with a movable arm F, or other equivalent movable part, so that the binder may be made travelling in relation to platform A, substantially as and for the purpose specified.

Third, the combination of the rack K and twister I, substantially as and for the purpose specified.

Fourth, the rack K, arranged on frame Q, substantially as and for the purpose set forth.

Fifth, the compressor shoe V, arranged on frame Q, substantially as and for the purpose specified.

Sixth, the slotted wire holder Y, bent or recurved, substantially as and for the purpose specified.

No. 45,886.—HERVEY WATERS, Northbridge, Mass.—*Machine for Rolling Metals*.—January 10, 1865.—The weight of the journal boxes of the upper roller is in this machine sustained by two bolts, one to each, which are tapped into the journal boxes and ascend upward through the hollow adjusting screws, resting upon the upper end of the latter by virtue of a large square section or collar, and susceptible thereby of being turned by means of a wrench. From the upper surface of each of these square collars is projected a pin, and a bar with two holes in one side of it at the proper distance apart and corresponding in size to the pins rests upon said collars, and by means of the connections formed with it by the pins, prevents the standards in which the journals are placed from spreading apart; while from each end of the bar is suspended a stirrup which supports the roller by the two necks thereof.

Claim.—The arrangement of a single yoke with its appurtenances and connections, substantially as and for the purposes specified.

No. 45,887.—THEOS. WEAVER, Harrisburg, Penn.—*Adjustable Chair*.—January 10, 1865.—This invention consists of a stationary post or back, to which is hung the back and arms of the chair, and so arranged that the seat may be adjusted and the whole folded in a small compass.

Claim.—First, the construction of the arm frame C C F F', and its combination with the haunch U, or with the haunch X and its collar K and pin, when so constructed as to enclose the back A and seat B, substantially as and for the purposes herein described.

Second, the combination and arrangement of the back A, which is provided with the arm rests D D, the tenons S S, the ratchets H, hooks and staples O O', with the seat B, which is provided with the arm rests E E, the tenons bearing on R, the ratchets J, when operated by the haunch U or X, substantially in the manner as and for the purposes herein shown and described.

No. 45,888.—R. B. WILLIS, Rochester, N. Y.—*Thill Attachment*.—January 10, 1865.—This invention consists in providing the head of the thill iron with a recess opening into the hole through which the bolt passes, into which recess is placed a friction plate or key, which can be kept pressing the bolt by means of a set screw passing through the head of said iron; the object is to avoid the rattling of the thills.

The prominent feature of this invention is the location of the set screw operating against the front instead of the rear end of the thill iron.

Claim.—The combination and relative arrangement of the set screw s, frictional plate a, and the thill iron B, with the bolt b and jaws D of the clip, the parts being constructed as and for the purposes shown and described.

No. 45,889.—J. F. WILSON, Boston, Mass., and JAMES C. BARTLETT, Charlestown, Mass.—*Mode of Operating Switches*.—January 10, 1865.—This invention relates to a means for operating the switch rail of turn-outs in horse railroad tracks; the object being to dispense with the ordinary extra manual power required to adjust the switch rail by operating the same directly from the car.

Claim.—The employment of a shipping wedge connected with and operated at will from the car, and so as to enter between the switch and main rails of a track, substantially as set forth.

Also, the arrangement of the shipping wedges for moving the rail in opposite directions, as shown and described.

45,890.—**DANIEL WOODBURY**, Rochester, N. Y.—*Derrick and Horse Power*.—January 10, 1865.—This invention consists in the application to any portable horse power of side braces, for the purpose of relieving the wheels from lateral strains, and in the employment of angle irons to the angles of the frame under the driving shaft, which cause the frame to preserve its proper shape under any strain; also, in the application to the driving shaft of a windlass and vertical jack frame, having a pivoted head to which may be attached the arm of a derrick, thereby constituting a portable horse power and revolving derrick.

Claim.—First, the employment of side braces J, they being constructed, arranged and applied to mounted powers, substantially in the manner shown and described and for the purpose set forth.

Second, the peculiarly constructed stake iron P, in combination with the double brace bars J, for the purpose of holding the stake when driven more securely in position.

Third, attaching the inner end of the sweep brace I to the bracket R, or to the rim of the wheel W, as and for the purpose shown and described.

Fourth, the combination and arrangement of the angle iron D with the joint plate E and the frame A of this class of horse powers, as shown and described and for the purpose specified.

Fifth, fitting the box *v* between the jaws or wings *n* of the joint plate E, so as to have but a line of bearing vertically between the parts, as and for the purpose specified.

Sixth, the combination and arrangement of the rope spool or windlass, and the jack G, constructed as shown and described, with the mounted powers, as and for the purposes herein set forth.

No. 45,891.—**A. R. BURDICK**, assignor to himself and J. D. FOSTER, Racine, Wis.—*Stake-holder for Railroad Cars*.—January 10, 1865.—The object of this invention is to obtain a stake-holder for sideless freight cars, which will allow its stake to be turned down in a horizontal position when required, so as to obviate the necessity of removing the stake from the car in loading.

Claim.—The box A, provided with the flange *d*, having a notch or recess *e* and two projections *ff*, one or both in combination with the collar C, provided with the flange *g*, internal elliptical opening and the projection *h*, all arranged substantially as and for the purpose herein set forth.

No. 45,892.—**JOHN FOWLER, jr.**, Cornhill, England, assignor to W. P. TATHAM, Philadelphia, Penn.—*Cultivating Land by Steam*.—January 10, 1865.—This invention consists in placing two engines at opposite head-lands, and by means of suitable gears, to which an endless rope is attached, and to which the ploughs are also attached, the ploughs are drawn alternately across the field.

Claim.—The combination herein described, whereby the power of two engines, situated on distant headlands, is simultaneously employed in giving motion to an agricultural implement by an endless rope, in manner substantially as described, to haul the agricultural implement alternately to and from each headland, as herein explained.

No. 45,893.—**GEORGE J. HILL**, Buffalo, N. Y., assignor to H. G. LEISENRING, Philadelphia, Penn.—*Hand Stamp*.—January 10, 1865.—This invention consists of a stamp inked by a ribbon, passing from one roller to another, and the claim is for a yoke which holds the die and type, and an elastic ring to support the bed.

Claim.—First, the yoke F, constructed and arranged in respect to plates E and G, substantially as specified.

Second, the bed, composed of the soft rubber ring I, metal plate J, and plate L, of harder rubber, leather, or other equivalent material, the whole being confined in a recess in a base plate B and arranged beneath the stamp, as described, for the purpose specified.

No. 45,894.—**T. O. WASHBURN**, assignor to himself and JOHN C. SCOTT, Millville, Mass.—*Calipers*.—January 10, 1865.—This invention consists in attaching to the calipers a slotted arc, graduated, one end being firmly fixed to one of the legs, the other furnished with a slot which plays over a pin in the other leg, and affixing at the axis of motion an index reaching down to the graduated portion of the slotted arc. As the calipers are opened and closed the index moves over the graduated arc and indicates the measurements.

Claim.—The index C and graduated plate D, when arranged and applied to the calipers, substantially as and for the purpose specified.

No. 45,895.—**P. J. BORIS**, Halifax, Nova Scotia.—*Revolving Grate*.—January 10, 1865.—This invention consists in a grate attached to a back plate revolving in a chimney between two apartments, so that it can be adjusted in either; the two dampers in the flue, one on either side of the grate, are so acted on by an eccentric on the prolonged axis of the plate that the one over the grate is opened while the other is closed.

Claim.—The revolving grate D, arranged in the lower part of the flue or chimney A, in combination with the eccentric F, placed on the axis or shaft C of the plate B, and arranged relatively with the dampers E E, to operate automatically by the turning of the plate B and grate D, substantially as described and represented.

No. 45,896.—WILLIAM D. GRIMSHAW, Birmingham, England.—*Automatic Hammer*.—January 10, 1865.—This invention consists in providing a reservoir for air, which is within the framework of the hammer, and between the pump and the slide valve which admits it (the air) to the cylinder. The novelty further consists in providing and arranging two friction wheels in such a way that the valve is made to admit more or less air to the cylinder, according to the force required and the duty to be performed: the wheels are arranged one on the main shaft and movable longitudinally thereon, so that it may be placed near to the centre, or at any point between them and the periphery of the other wheel, which is placed on a vertical shaft, and to which the valve rod is attached. If the first-named wheel is near the centre of the last named little motion is imparted, and a light blow of the hammer is the consequence; but if it is carried nearer to the periphery the hammer is slower in its motion and a more forcible blow is given.

Claim.—First, the system of employing a reservoir between the pump or pumps and the hammer cylinder for holding the compressed air, the reservoir to be formed in the framework of the machine.

Second, the combination of the adjustable but otherwise stationary valve d' d' , the slide valve k , the cylinder f , the piston g , the piston rod h , and the hammer i , substantially as set forth.

Third, the combination of the valve rod w , the friction wheel y , the sliding friction wheel b' , and the shaft d , substantially as and to the effect herein above set forth.

Fourth, the combination of the reservoir b , the pump o , and the stop-cock t , as described.

Fifth, the arrangement described, of the pump o , reservoir b , friction wheels b' and y , valve rod w , valve k , cylinder f , and piston g , by which they are made to operate in relation to each other, substantially as set forth.

No. 45,897.—THOMAS SHORT, Fairmont, Ill.—*Gang Plough*.—January 10, 1865.—This invention consists in a rectangular frame, mounted on two wheels, with a crank shaft secured to the front end, and to which the plough frame is attached; it is raised and lowered by means of a lever, thus enabling the driver to give the ploughs a vertical movement: a lateral movement is communicated by a standard or handle rising from the plough frame.

Claim.—The arrangement of the double crank-shaped connecting rod G , devices e e , links a' a' , beam E , lever H , and post I , the whole being employed for joint operation, in the manner and for the purpose specified.

No. 45,898.—HIRAM BERDAN, assignor to LEVI P. MORTEN, trustee of HIRAM BERDAN, ABIA A. SELOVER and WILLIAM B. BENSON, New York, N. Y.—*Rifling Breech-loading Fire-arms*.—January 10, 1865.—In this invention the novel feature consists in continuing the rifling behind the barrel proper, or through the counter bore on its rear, by means of which, having suitable fixed ammunition prepared, the projectiles will exactly fit the bore through which they are to pass with but little friction, and receive a motion of rotation according to the twist.

Claim.—The rifling or grooving of the counter bore of breech-loading fire-arms, substantially as and for the purposes herein shown and described.

No. 45,899.—HIRAM BERDAN, assignor to LEVI P. MORTEN, trustee of HIRAM BERDAN, ABIA A. SELOVER and WILLIAM B. BENSON, New York, N. Y.—*Breech-loading Fire-arm*.—January 10, 1865.—In this invention a hinged gate opening laterally serves as a breech block, against which the cartridge case abuts. It has a forward projecting lip to cover the front joint, and a projecting tail at the rear to cover the channel through which the cartridge is passed, securely keeping out the moisture. A ring extractor underneath is used to eject the cartridge shell.

Claim.—First, the projecting plate E , swinging in a plane transverse to the barrel, in combination with the ring G , substantially as and for the purposes set forth.

Second, the protecting cover I and protecting plate E , in combination with the latch D , as herein specified.

No. 45,900.—Cancelled.

No. 45,901.—HIRAM BERDAN, assignor to LEVI P. MORTEN, trustee of HIRAM BERDAN, ABIA A. SELOVER and WILLIAM B. BENSON, New York, N. Y.—*Attaching Bayonets to Fire-arms*.—January 10, 1865.—In this invention the shank of the bayonet is shorter than usual, and the holding stud, or end of the barrel, so located as to bring the blade directly over the ramrod, which is pushed up under the blade or shank, and thus the locking clasp or ring is better secured from disturbance.

Claim.—Placing the bayonet blade and shank upon the under side of the barrel, in combination with the ramrod, substantially as and for the purpose herein shown and described.

No. 45,902.—DAVID AHL, M. D., Newville, Penn.—*Method of Preventing Oil Barrels from Leaking*.—January 17, 1865.—This invention consists in saturating or coating the staves, or the barrels, with a composition made by combining shellac or other water-proof gum or resin with asphalt, coal tar, or other similar matter.

Claim.—The composition, as herein specified, for the purposes herein substantially set forth.

No. 45,903.—D. L. and J. M. BARLOW, Cohoctah, Mich.—*Harrow and Seeder*.—January 17, 1865.—This harrow may be attached to any wheeled carriage used in farming operations. By means of a pitman attached to an eccentric the harrow receives a reciprocating motion as it advances, which motion is regulated by a slotted platform through which the harrow plays. By means of both its progressive and its lateral motion the harrow is enabled to pulverize the soil more completely than it could with only the former.

Claim.—First, the harrow *n*, constructed and operated substantially as herein described. Second, the harrow *n*, in combination with the seeder *B*, the whole constructed and operated substantially as and for the purposes herein set forth.

No. 45,904 — WILLIAM BELBIN, Baltimore, Md.—*Oyster Dredges*.—January 17, 1865.—The front rods which support the rake or bar have an elbow or curvature at their lower end to serve as a shield, preventing the teeth from engaging in the side of the vessel or roller.

Claim.—The combination, in an oyster dredger, of the rake bar *A*, front rods *C*, and rear rods *D*, with the head *E* and swivelling link *F* when the rods *C* are curved, constructed and arranged as and for the purposes described.

No. 45,905.—J. W. BOPE, St. Louis, Mo.—*Harvester*.—January 17, 1865.—This invention consists in hinging the grain platform at its rear edge to adjustable arms, secured to the finger bar or to a rigid table connected therewith, the arrangement being such that the platform may be shortened or lengthened to suit the length of straw upon which the machine is operating; by raising the front of the platform, the completed gavel thereon is caused to slide off upon the ground, while at the same time the front edge of the platform acts as a cut-off to arrest the fall of the accumulating grain, until the gavel is discharged from the platform, when the platform drops, and the grain held up by its front edge falls thereon.

Claim.—The adjustable sliding platform or dropper hinged at or near its rear edge, as described, so that by the raising of the front edge it performs the two-fold function of the dropping gavel, and at the same time operating as a perfect cut-off to arrest the falling grain.

No. 45,906.—J. W. BOPE, St. Louis, Mo.—*Harvester*.—January 17, 1865.—This invention relates to the manner of discharging the grain from the platform upon which it falls as it is cut, and it consists in pivoting said platform, at or slightly in rear of its centre, to arms rigidly connected to and extending back from the finger bar, the platform being so pivoted to said arms as to vibrate about a fixed point thereon, and, by simply raising the forward edge, to slide the grain off upon the ground, said forward edge acting at the same time as a cut-off to arrest the accumulating grain and keep it separate from that which is being discharged.

It further consists in a specific arrangement of lever and cord for operating said platform, and in the arrangement in connection with the platform, of a shield to guard against obstructing matter, as straws, &c., getting under the platform when its forward edge is elevated, and preventing its operation.

Claim.—First, hinging the grain platform, which is arranged directly behind the cutting apparatus, at or near its centre, substantially as described, so that it will vibrate upon a fixed point, and by the elevation of its front edge perform the double function of discharging the completed gavel, and simultaneously therewith arresting upon its front edge the fall of the accumulating grain, as described.

Second, operating the tilting platform *A* by means of the lever *D*, with the chain or cord *C*, in the manner as and for the purposes herein described.

Third, the adjustable shield or guard *E*, arranged and operating in connection with the grain platform, as herein described, for the purposes set forth.

No. 45,907.—W. B. BURNETT, New York, N. Y., and JAMES P. MCINTOSH, Brooklyn, N. Y.—*Whitewash Brush*.—January 17, 1865.—This invention consists in connecting the handle with the brush-block, and is so arranged that the handle can be placed at any desired angle, by means of a ferrule and screw on the handle, and a slotted clamp on the brush.

Claim.—First, a brush-block in combination with a slotted way *E*, substantially as described.

Second, a slotted way *E*, in combination with a ferrule *C*, substantially as described.

Third, a brush with its handle applied thereto, when the several parts are constructed and operated substantially as described.

No. 45,908.—JOHN CHILCOTT, Brooklyn, N. Y.—*Gas or other Retorts*.—January 17, 1865.—This invention consists in surrounding the bottom, sides, and top of a gas or other retort with a jacket or casing *C*, between which and the retort a continuous system of flues is formed by longitudinal partitions, having openings at opposite ends alternately.

Claim.—First, surrounding the bottom, sides, and top of a gas or other retort with a jacket or casing *C*, between which and the retort a continuous system of flues *E E* is formed by means of longitudinal partitions, having openings at opposite ends alternately, whereby the flame is caused to circulate back and forth several times along, and once all around, the retort, substantially as and for the purpose herein specified.

Second, the jacket or casing C, divided longitudinally into two parts, and having the flue partitions attached to its interior, so as to be detachable from the retort, substantially as and for the purpose herein specified.

No. 45,909.—G. F. J. COLBURN, Newark, N. J.—*Comb*.—January 17, 1865.—This invention consists in cutting, carving upon, or otherwise affixing to a pocket-comb a graduated scale, so as to serve as measured rule.

Claim.—A comb having graduations, or a rule arranged therewith, substantially as described.

No. 45,910.—GUY DAVIS, Syracuse, N. Y.—*Oscillating Valve*.—January 17, 1865.—This invention consists in arranging with a conical suspended valve a series of openings for the induction and eduction of steam to and from the engine, in such a manner as to relieve it of a large proportion of its friction; the steam being admitted to the centre of the valve, which is made hollow for that purpose.

Claim.—The conical suspended valve I, with its openings J J communicating with the steam chest, and the induction openings K K, and eduction opening T communicating with the cylinder, substantially as described.

No. 45,911.—JOHN H. DICKERSON, Cincinnati, Ohio.—*Portable Forge*.—January 17, 1865.—This invention consists in an arrangement of devices, whereby the separate parts required to constitute a blacksmith's forge can be taken apart, folded up, or packed one within another, so as to occupy as little space, and be rendered as convenient for transportation, as possible.

Claim.—First, the combination of the pan A', hinged plate Y, bolts W W, and catch X, constructed and employed as herein specified, to constitute a forge bed and screen while in use, and a close and secure tool box in travelling.

Second, the hinged frame G and brace rods L L, employed to support the bellows while in use, and adapted to be compactly folded for transportation.

Third, the combination of the pan A', screen Y, bellows E C, stand G, lever J, and braces L, all constructed and arranged substantially as and for the purposes set forth.

No. 45,912.—WILLIAM C. DODGE, Washington, D. C.—*Cartridge Retractor for Many-chambered Fire-arms*.—January 17, 1865.—A disk attached to a central spring rod or stem is notched or recessed at its edge in conformity with the chambers of a fire-arm, (whether of a revolving cylinder, or of multiple stationary barrels,) so as to fit under the flanges of the metallic cartridges, whereby all the cartridge cases may be withdrawn simultaneously on the proper movement of the central stem. The spring restores the retractor to its closed position for receiving the cartridges.

Claim.—First, the ejection, simultaneously, of two or more cartridge cases from a many-chambered fire-arm, in the manner and by the means substantially as herein set forth, whether the chambers be stationary or revolving, and whether loaded at the front or rear.

Second, the retractor *a*, provided with the stem *b* and spring *c*, or their equivalents, in combination with the cylinder or barrels of a many-chambered fire-arm.

Third, providing the retractor *a* with a stem, which is made to extend through the cylinder or barrels, and project at either the front or rear end thereof, for the purpose of being operated as shown and described.

No. 45,913.—JOHN DU BOIS, Williamsport, Penn.—*Revolving Flood Gate*.—January 17, 1865.—This invention relates to a mode of constructing flood gates, which constitute a part of the dam when closed, and which are used for making what are known as artificial or splash floods, (when the streams are too low to be navigated,) without accumulating a large body of water, and for letting it off in sufficient quantity at pleasure, for the purpose of floating logs, rafts, boats, &c.

Claim.—First, a centrally balanced revolving flood gate, constructed and operating substantially as herein described.

Second, supporting the gate C in its bearings in such manner that it shall be allowed to rise bodily in the act of opening to allow the water to escape, and using the arms *c c*, or equivalent means, for holding the gate down and preventing it from turning, substantially as described.

Third, the abutment *b* on the floor of the chute, when used in conjunction with a revolving flood gate, operating substantially as described.

Fourth, a revolving flood gate, which is so arranged and constructed that it will be opened by the water in the basin rising above a certain determined level, substantially as described.

No. 45,914.—DAVIS EMBREE, Dayton, Ohio.—*Method of Removing Incrustation from Boilers*.—January 17, 1865.—This invention consists in the use of still slop and of quicklime in removing incrustation from boilers.

Claim.—The use of still slops to prevent or remove incrustation by lime in steam boilers, and the use of quicklime, in the manner herein substantially set forth, to prevent such incrustation.

No. 45,915.—WILLIAM ELMER, New York, N. Y.—*Manufacture of Illuminating Gas*.—Patented in France December 5, 1864.—January 17, 1865.—This invention consists in first distilling the gas stock at a temperature below that at which permanent gas is produced, and then passing the products of distillation through another retort, heated to a high temperature, and containing zinc or other material capable of elevating and fixing the oxygen in the vapor contained in water, or other products from the first retort. Steam or superheated steam may also be added in either retort.

Claim.—The process of manufacturing gas by distilling the gas stock in one retort and converting the volatile product of the distillation and illuminating gas in another retort in the presence of a material which, when at a high temperature, will absorb and fix the oxygen contained in the volatile product of the distillation, the process being conducted substantially as set forth.

Also, the process of manufacturing illuminating gas by distilling the gas stock in one retort, and converting the volatile product of the distillation into illuminating gas in another retort, in the presence of an additional quantity of steam to that obtained from the gas stock, and of a material which will absorb and fix the oxygen contained in the volatile product of the distillation and in the additional steam, the process being conducted substantially as set forth.

No. 45,916.—FREDERICK FICKEY, jr., Baltimore, Md.—*Smoking Pipe*.—January 17, 1865.—This invention consists in fixing to the bottom of a pipe bowl a cup of copper or any suitable material, with a hole in the bottom for the smoke to pass through. The device is so arranged as to protect the bottom of the bowl from the effects of combustion, and at the same time to avoid destroying the absorbent properties of the material of which the bowl is composed.

Claim.—The use of the metallic cup B, in combination with the absorbent bowl of a tobacco pipe, substantially in the manner and for the purpose set forth.

No. 45,917.—JOHN S. FISK, Meadville, Penn., and JAMES WESTERMAN, Sharon, Penn.—*Coal-mining Machine*.—January 17, 1865.—The object of this invention is to substitute machinery for hand labor in mining, with particular reference to economy of material, by sinking thin single-line cuttings in lines perpendicular to the axis of the cutter shaft, and to this end this invention consists in so mounting a circular saw or saws upon an arbor or shaft that it or they may rotate in a horizontal plane at the lower end of the arbor or on any desired part of its length, and in combining the arbor and its saws with gearing to give it both a rotating and a feeding motion, when the latter can be made constant or intermittent at the pleasure of the operator.

Claim.—The combination in a coal-mining engine of one or more circular saws on a single mandrel with an adjustable feeding mechanism arranged on a movable truck, substantially in the manner described and for the purpose set forth.

No. 45,918.—JOHN S. FISK, Meadville, Penn., and JAMES WESTERMAN, Sharon, Penn.—*Mode of Ventilating Mines*.—January 17, 1865.—This invention consists, first, in combining one or more reservoirs for compressed air, located within a mine, with a force pump or engine located at or near the mouth of a mine, so as to exert a uniform pressure at the working point, where compressed air is used as a motor, and to prevent the stoppage of the ventilation in case of a temporary stoppage of the engine.

Second, in the employment of one or more reservoirs for compressed air, located within the mine, into which air is pumped through large tubes or pipes, and from which it is withdrawn through smaller eduction pipes for use as a motor, or for ventilation, or for both.

Claim.—First, the combination with a forcing pump or engine, located at or near the mouth of the mine, of one or more reservoirs for compressed air, located within the mine at a distance from the engine and near the working point, substantially in the manner herein described, for the purpose of ventilating the mine, and of exerting a uniform pressure as a motor, as set forth.

Second, the combination of one or more reservoirs, arranged substantially as herein described, with a large induction and small eduction pipe and stop-valves, as and for the purpose set forth.

No. 45,919.—WALTER FITZGERALD, Boston, Mass.—*Self-loading Fire-arm*.—January 17, 1865.—A lever, by one movement, brings the forward cartridge from the magazine partially into the proper position for firing. By another movement of the lever the cartridge is pressed home, and the next cartridge in the magazine is prevented from passing into the barrel. The piece having been discharged, by another movement of the lever the empty cartridge case is withdrawn from the barrel and ejected from the gun. The next movement of the lever brings the next cartridge partially into position, as before.

Claim.—First, the breech block D and guard lever E, so connected by the pins *c d* and slots *b u* that the vibration of the lever E will give the breech block the required motions in its passage within the breech C, substantially in the manner and for the purposes specified.

Second, in combination with the breech block D the cartridge guide F and cartridge dis-

charger H, when constructed and arranged to operate together with a magazine, substantially as herein described and represented.

Third, the percussion rod G, constructed and operated substantially in the manner and for the purpose set forth.

Fourth, locking the magazine, substantially in the manner set forth.

No. 45,920.—DANIEL D. GITT, Arendtsville, Penn.—*Horse Rakes*.—January 17, 1865.—The object of this invention is to assist the operator in discharging the load, and to provide for the independent action of each tooth to such an extent that there is no danger of breaking the same. A rolling weight is placed upon the tilting bar in such a manner that when the rake is in working position the weight is back of the rake head, but upon tilting the same it will roll forward, displacing the centre of gravity and assisting the operator. The ball may be attached to the lever so as to swing backward and forward instead of rolling. The staple and spring are one, the staple being open to afford freedom of motion to the tooth.

Claim.—First, the employment, in combination with any part of the rake, which, for the purpose of discharging the rake, is moved or movable, of a weight, under the arrangement herein described, so that while the centre of gravity of the lifting apparatus is back of the fulcrum, it shall, on the rake being operated for discharge, be displaced and thrown forward in the manner herein described.

Second, combining with the teeth made of wire or other material, hinged to or hung upon a fulcrum bar, a spring staple, under the arrangement herein described, so as to bear with yielding pressure on the teeth.

No. 45,921.—SAMUEL B. HAINES, Lancaster, Penn.—*Horse Powers*.—January 17, 1865.—This invention consists in the use of horse powers with several radial arms or levers for attaching the horses. It is found that a sudden jerk from one or two horses gives a violent side strain, which is liable to break the machine, and especially to break or throw out of place the central pivot or shaft of the main wheel. The object of this invention is to remedy these difficulties by the use of yokes, pivoted upon the radial levers, and a large hollow conical pivot with a bed plate of peculiar construction.

Claim.—First, the vibrating yokes H, in combination with the levers D and the conical pivot L, substantially as set forth.

Second, the hollow conical pivot L, when cast in one piece with the head plate K, extending so as to fix the gearing at the circumference of the main wheel A, substantially as specified.

No. 45,922.—WILLIAM HALSTED, Trenton, N. J.—*Artificial Fuel*.—January 17, 1865.—This invention consists in taking blocks of bog turf, or peat of salt marsh, prepared by dipping them in tar, and combining with such blocks coal dust, &c., to form fuel.

Claim.—The combination and mixture of the ingredients in the manner and proportions above described.

No. 45,923.—J. M. HARSHBARGER, Brandonville, W. Va.—*Seed Sower*.—January 17, 1865.—In this invention the seed slide is in two sections, which may be disconnected at will, thus rendering half the machine in operation while passing trees or fences, and saving seed thereby.

Claim.—A seed slide, in two or more sections, adapted to be connected and disconnected by the employment of a link e, or its equivalent, substantially as and for the purpose herein described.

No. 45,924.—DANIEL HUTCHINSON, Fort Ancient, Ohio.—*Corn Sheller*.—January 17, 1865.—In this machine the corn descends vertically between two revolving disks or plates, one armed with teeth, and the other with ribs, to give the ear a rotary motion. The disks are carried by separate shafts that receive their motion from the same driving wheel. One side of the hopper is prolonged downwards, and forms a breast, against which the ears are held and rotated. The end of the shaft rests upon a spring which yields readily to the pressure of a very large ear.

Claim.—The disks C and D and the breast h, when combined and arranged relatively to each other, in the manner and for the purpose specified.

No. 45,925.—JOHN C. KENEDY, Logansport, Ind.—*Straw Cutter*.—January 17, 1865.—This invention consists in constructing the sash or sliding frame of a straw cutter so that it will slide in an inclined position, having attached to it one or more knives horizontally, thereby giving a drawing or a transverse cut; and also in providing one or more knives, which are placed in an inclined position, secured at the upper end by a bolt or rivet, and so arranged and constructed that the motion of the lever causes the inclined knife to work in a hinged manner, bringing the edges of the horizontal and inclined knives together.

Claim.—First, the described arrangement of the diamond or angular-shaped sliding sash or frame D D D, horizontal knives b B, when constructed and arranged substantially as described and for the purposes set forth.

Second, the inclined knives a A, when constructed and operated by the rod F and lever E, substantially as and for the purposes set forth in the specification.

No. 45,926.—WILEIAM A. L. KIRK, Hamilton, Ohio.—*Sod Cutter*.—January 17, 1865.—This invention consists in a combination of devices indicated in the claim; to understand which the drawings and specification must be referred to.

Claim.—First, the arrangement of frame A, rollers B and C, and rod-cutting blade E e' e', substantially as set forth.

Second, the parts A B C D D' e' e' F G K and L, as herein arranged and combined.

No. 45,927.—ROBERT LEVINGTON, Monroe, Mich.—*Bumper Spring*.—January 17, 1865.—This invention consists in attaching a protector to the bed of a car body to serve as a bumper, and also to protect the spring that is attached to the draught bar from any unnecessary strain when the cars are run together.

Claim.—The protector K, and the yoke J in combination therewith, as is clearly set forth and described

No. 45,928.—EDWARD F. MCFARLAND, Worcester, Mass.—*Forging Apparatus*.—January 17, 1865.—This invention consists essentially in suspending the hammer by means of a strong spiral spring, from a double-elbowed shaft arranged in the upper part of the hammer frame. One end of this shaft projects outside of the frame and is there bent in the form of a crank, and a rod depending from the handle of this crank serves as a means of vibrating the crank to which the spring is attached, and thus occasions a resiliency of the spring, and consequent rise and fall of the hammer.

Claim.—First, constructing the stem D' of a hammer D of a spring which is attached at its upper end to a crank shaft a, substantially as described.

Second, the combination of a hammer D, spring stem D', crank shaft a, and lever E, operating substantially as described.

Third, the use of shelves gg, adapted to support the hammer D when not in use, substantially as described.

Fourth, the application of a counter weight h, which is suspended by a spring k to a hammer, or its equivalent, which is also suspended by a spring stem, substantially as described.

No. 45,929.—ELIJAH MCKESSON, Philips' Mills, Penn.—*Side-hill Ploughs*.—January 17, 1865.—This invention consists in a device for securely locking the corners of the mouldboard to the land side, the land side and mouldboard being fastened into the grooves of the shoes, which form one straight line with the point of the plough.

Claim.—First, the double mouldboard having a triangular front, corners to lock in the groove of the land side, and a pointed projecting termination, constructed, arranged, and operating substantially as and for the purposes set forth.

Second, the combination of the shoes 1 and 2, with the mouldboard and land side and share, when constructed, arranged, and operating substantially as described.

No. 45,930.—JOHN MCKNIGHT, Philadelphia, Penn.—*Detachable Flat-top and Elevated Cooking Stove*.—January 17, 1865.—This invention consists in constructing a cooking stove in two parts, so that it can be converted readily into either a flat-top or elevated oven stove.

Claim.—First, so constructing a cooking stove in two sections that it can be converted from a flat-top stove to an elevated oven stove, or *vice versa*, substantially in the manner and for the purpose herein set forth.

Second, the hollow projection a', at the rear of the ash-pit and below the fire grate, the said projection communicating with the flue G, as and for the purpose specified.

Third, the detachable hollow casing H, forming a communication between the ash-pit B and flue G, as and for the purpose set forth.

No. 45,931.—GEORGE MEADER, Ottawa, Ill.—*Wrenches*.—January 17, 1865.—This device consists of a truncated circular plate having ratchet teeth upon the curved portion of its periphery and a straight bar attached to the straight portion. To the bar the two jaws are attached and caused to slide upon, to, or from each other, by a right and left screw. The slotted end of the handle embraces the disk on each side and turns upon a pivot which passes through its centre, and a spring pawl for holding the disk in any required position, and by which, consequently, the jaws may be projected in any direction within the limits of one hundred and eighty degrees, is attached to the handle in the usual manner.

Claim.—As a new article of manufacture the adjustable wrench, constructed and operated as herein described.

No. 45,932.—GEORGE MILLER, Washington, D. C.—*Carpenters' Gauge*.—January 17, 1865.—The object of this invention is to facilitate the operation of scribing skirting to stairs, and it consists in a gauge with a free sliding bar, to the extreme end of which is a point. Intermediate between this point and the head is a scribing tooth, which marks the line to which the board is cut after being slid on the board to be fitted, by running the point at the end upon the stair or upon the string board.

Claim.—A gauge constructed substantially as described and for the purpose specified.

No. 45,933.—GEORGE RODNEY MOORE, Lyons, Iowa.—*Fire Chamber Clearer*.—January 17, 1865.—This invention consists of a plate in the front part of the fire pot, attached to the edge of an oscillating grate, and so arranged that when the grate is moved by a draw rod, it prevents coals and ashes falling into the ash-pit in front, and throws them into the lower part of the grate.

Claim.—The attachment of the plate or clamp C, or its equivalent, to the grate E, substantially in the manner and for the purpose set forth.

No. 45,934.—ELIAS C. PATTERSON, Chicago, Ill.—*Cultivator*.—January 17, 1865.—In this invention the cultivator blades consist of one long one and three shorter ones arranged behind the first on a bed plate. The bed plate is attached to curved arms or levers, which are pivoted at their rear ends to the frame of the machine. The forward ends are provided with pins which work in slots of levers, pivoted above the axletree, and extending back to the driver's seat. By depressing the back end of the lever the blades are raised from the ground.

Claim.—First, the curved levers A, B, C, D, constructed and operating substantially as described.

Second, the combination of the curved and straight levers, constructed and operating substantially as described.

Third, the combination of the curved and straight levers with the ploughs, constructed and operating substantially as described.

Fourth, the peculiar form and arrangement of the middle rear ploughs, in connection and combination with the two outside rear ploughs, all constructed and operating substantially as described.

No. 45,935.—F. C. PAYNE, New York, N. Y.—*Artificial Fuel*.—January 17, 1865.—This invention consists of coal dust mixed with plaster of Paris and hydraulic lime, formed into lumps.

Claim.—First, a fuel composed of a conglomerate of coal screenings, or small particles of coal and hydraulic lime, substantially as herein described.

Second, the use of plaster of Paris with hydraulic lime, substantially as herein described, in cementing together coal screenings or small particles of coal, to render the latter serviceable as fuel.

No. 45,936.—DEWY PHILLIPS, Shaftsbury, Vt.—*Laths for Buildings*.—January 17, 1865.—This invention consists in a tongued and grooved lath, with undercut grooves in its surface, the same being designed to aid each other in resisting any disturbing force, and by their use a strong wall is produced and a great saving effected in the amount of mortar required. With brick walls this style of lathing makes the plastering very dry, and under all circumstances the non-conducting character of the wood makes the plastering warmer in winter and cooler in summer.

Claim.—Tongued and grooved laths, formed with grooves in their surfaces, receiving the mortar, substantially as specified.

No. 45,937.—ANSON H. PRATT, Yellow Springs, Ohio.—*Floor Covering*.—January 17, 1865.—This invention consists in pasting on floors several layers of paper, the last being printed in water colors and varnished; such as ordinary wall paper. When it is desirable to have the covering removable, the different thicknesses are pasted together to form a kind of pasteboard, which may be used as ordinary oil-cloth.

Claim.—The application and use of figured or ornamental paper, printed with water colors, to floors, as a substitute for oil-cloth and carpets, as herein described, whether stationary or movable.

No. 45,938.—WILLIAM PRICE, Cincinnati, Ohio.—*Mangle*.—January 17, 1865.—This invention consists in encasing the working parts of a mangle with a metallic case, the same forming the supports for a table or apron to the articles on a plane between the pressure rollers when open for use, and also to close up the mangle to keep all the working parts free from dust when not in use.

Claim.—Encasing the working parts of a mangle, the case being so constructed and hinged as to let down and form the support for guiding the articles in a line between the pressing rollers, and fold up and close together so as to protect the working parts when not in use, substantially as herein specified.

No. 45,939.—MARTIN RINEHART, Monroe, Mich.—*Car Coupling*.—January 17, 1865.—This invention consists in providing an apron or direction by which the coupling link is guided into the mouth of the draw-head, so that the coupling may be automatic.

Claim.—The combination of the sliding block A, apron B, with the hook C, and link d, substantially as described and for the purpose set forth.

No. 45,940.—GEORGE W. SAYRE, Pischah, Ohio.—*Washing Machine*.—January 17, 1865.—This invention consists in the combination of a series of corrugated beaters, which are suspended and actuated by means of cranks and pitmen, and an adjustable weight.

Claim.—The combination of the adjustable oscillating frame K, provided with cranks, pitmen, pendants, and beaters, with the adjustable weight I, and scroll bottom B, arranged and operating in the manner and for the purpose substantially as described.

No. 45,941.—JOHN M. SPIEGLE, Philadelphia, Penn.—*Condenser.*—January 17, 1865.—This invention consists in the use, in connection with the air-pump, of a condensing steam engine of perforated tubes for introducing jets of air into the water, as it is forced by the air-pump towards the discharge valve, thereby converting the water into spray; the object being to prevent the injurious effects which a violently impelled, unbroken volume of water has on the valve. The device consists of a pipe through which the air is conveyed, which is inserted in the passages between the air-pump and the hot-well, and that portion of it which is within the passage is made in the form of a cross, and perforated with small holes for the egress of the air, that it may be mingled freely with the water as it passes towards the discharge valve.

Claim.—The use, in connection with the air-pump of a condensing steam engine, of the perforated tubes *d* and *e*, or their equivalents, for introducing jets or streams of air into the water as it passes from the air-pump to the hot-well, as set forth.

No. 45,942.—A. B. SPROUT, Hughesville, Penn.—*Horse Rake.*—January 17, 1865.—This invention relates to the construction and attachment of the teeth. The teeth are triangular in form, and so applied that a flat surface is presented to the hay in front, while the back of the tooth presents a salient edge. The upper end of the tooth terminates in a flattened coiled spring which surrounds a spool, provided with a notch or chamber which holds the tooth in place. This spool forms the upper part of a plate, which is securely fastened to the head by means of a clamp and screw.

Claim.—First, making a curved rake tooth of a triangular sectional shape, (or its equivalent, semi-elliptical or semicircular,) and so applied that the flat side shall be on the inner side of the curve to endure the tensional strain, while the rear salient edge shall act as a stiffener to the tooth.

Second, the combination of a tooth of a triangular sectional shape, (or its equivalent, semi-elliptical or semicircular,) and with a flat side on the inside of the curve of the tooth, with a coiled spring by which it is attached to the head, and by means of which its elasticity is increased.

Third, the plates C *c*, adapted to be secured in position by the screw *c'*, substantially and for the purpose specified.

Fourth, the spool C2 *c2* c3, constructed and arranged substantially as described, and adapted for the attachment of the spring A, in the manner set forth.

No. 45,943.—MAURICE VERGNES, New York, N. Y.—*Piano-fortes.*—Antedated January 2, 1865.—This invention consists of a drum attachment to a piano-forte, of such a nature that it will automatically operate by simple clock-work arrangement, to be set free when required by a pedal.

Claim.—First, the application to a clavichord instrument of a mechanism to operate a hammer upon a drum, in the manner substantially as above described.

Second, the use of the slide H, and the curb straps to hold the hammer in the condition to produce the roll of the drum, in the manner substantially as above described.

No. 45,944.—OWEN G. WARREN, New York, N. Y.—*Apparatus for Amalgamating Metals.*—January 17, 1865.—This invention consists of a tub provided with a cock and stirrer. On the top of the tub is placed another tub with a perforated bottom. The ore is placed with water in the lower tub, and the mercury in the upper tub, from whence it falls through the perforated bottom in a shower into the ore. The amalgam is drawn off by means of a cock.

Claim.—First, pouring quicksilver down through a sieve or strainer into a mass of comminuted ores and water, which has been subjected to a cooking process to gather the ores contained, in the manner substantially as above described.

Second, obtaining the metals in their successive degrees of fineness by successive leeching with quicksilver poured down through a strainer into the ores and water, and successive gatherings of the amalgam formed, in the manner substantially as above described.

No. 45,945.—EDWARD WEISSENBORN, Hudson City, N. J.—*Oil Cup*.—January 17, 1865.—The object of this invention is to lubricate moving mechanism with an unfailing certainty, and to graduate the quantity with a view to economy and efficiency, at the same time filter the oil, and thereby protect the journals and bearing of machinery from injury by reason of grit or other hard particles contained in the oil. Its novelty consists in the combination of a sponge, follower, screw, and nut, with the oil cup.

Claim.—The sponge C, the follower D, screw E, and movable winged nut F, applied in combination with each other, and with the oil cup, and operating substantially as herein specified.

No. 45,946.—JASON A. BIDWELL, assignor to himself, H. J. LITCHFIELD, DANIEL M. ROBERTSON, and ASAPH URBURCHILL, Boston, Mass.—*Screw-Nutting Machine*.—January 17, 1865.—This invention consists in a device for grasping the set-screw blank, and is composed of two jaws, sliding on an upright standard. The lever for operating them is attached to the lower jaw, the upper jaw resting thereon, and the two being clamped together by two side levers, the lower ends of which are attached to the ends of the lower jaw, and are moved therewith. In the upper ends of these levers are slots, cut at such an angle, and sliding over pins or studs in the upper end of the standard in such a manner as to throw said levers forward, when the jaws are raised to carry the screw in front of the saw, which motion causes a cam or incline thereon to press upon other studs, one in each end of the upper block or jaw, and between which and the lower jaw the screw blank is placed.

Claim.—First, the jaws E E, sliding blocks A A, and controlling spring K, when combined with each other, and with a circular saw P, substantially in the manner and for the purpose herein set forth.

Second, the arrangement and combination of the sliding blocks A A' with the upright B, slotted side levers Q Q, and operating lever M, or their equivalents, substantially in the manner and for the purpose herein set forth.

No. 45,947.—JOSEPH DE ROSTHORN, Vienna, Austria, assignor to CLEMENS HERSCHEL, Davenport, Iowa.—*Casting Mould Metal*.—January 17, 1865.—This invention consists in what is technically called the riser, by substituting for the same a heavy weight, to the bottom of which, and projecting downward therefrom, is attached a wooden plug or plunger, which breaking through the crust which forms on the surface of the molten mass, is forced down by the weight above, and compresses and condenses the metal in the mould.

Claim.—The improved method of operating to increase the density and strength of metallic castings, substantially as set forth.

No. 45,948.—LOOMIS G. MARSHALL, Mokena, Ill., assignor to himself and F. W. HUGHES, Pottsville, Penn.—*Grate*.—January 17, 1865.—This invention is designed as an improvement on Morse and Lewis's patent, and consists of a cone-shaped or pyramidal grate, opened at its bottom, intended to be placed in the centre of a fire-pot in a stove. The bars of these grates are inclined downwards from the centre to the outside, so as to prevent the fire-wood, sawdust, tan, &c., which it is intended to burn, from clogging up the apertures in the grate.

Claim.—A conical or angular-shaped grate, formed of bars sloping from the inside to outside, as herein described and for the purposes set forth.

No. 45,949.—ROBERT MURRAY, Boston, Mass., assignor to himself and JAMES W. TUFTS, Melford, Mass.—*Faucet*.—January 17, 1865.—The valve shaft is in line with the horizontal induction pipe, which induction pipe has an enlargement near its outer end to form the valve case. Around the mouth of this narrow pipe is a recess for the feet or projecting parts of the valve shaft to move in, the intermediate spaces permitting the flow of the liquid into the valve chamber the valve shaft narrowing to pass through a packed screw cap, which adjusts the enlarged interior part within its apartments. The eduction port is on the under part of the valve case, and the leather packed valve is held to this point or seat by a spring, having its opposite extremity within the described enlargement of the valve shaft. The movement of this valve is described by scoops to a traverse sufficient to cover and uncover the eduction port.

Claim.—The improved faucet, having its valve shaft arranged in the prolongation of the axis of its induction tube and pivoted in or at the inner end thereof, and made with its inner journal so channelled as to enable a fluid to pass into and through it while passing from the induction tube into the valve case, the faucet being in other respects as specified.

No. 45,950.—WILLIAM PAINTER, Baltimore, Md., assignor to himself and CHARLES PAINTER, Owings's Mills, Md.—*Material for making Boxes*.—January 17, 1865.—This invention consists in saturating pasteboard with asphaltum, and using it as a substitute for tin, in making boxes, &c.

Claim.—As a new article of manufacture the asphaltic board, made substantially as described, for the manufacture of boxes, packages, and other articles.

No. 45,951.—FREDRIKA SCHENKL, Boston, Mass., administratrix of JOHN P. SCHENKL, deceased, assignor to self and EDWARD A. DANA, Brookline, Mass.—*Packing for Rifled Projectiles*.—January 17, 1865.—The embracing and packing sabot is made of papier-mâché, as usual fitting the exterior and base of the projectile, but having a metallic band on its front end, and a cap, or shoe and band combined, to protect its base from the disrupting effects of the explosion of the charge.

Claim.—The combination of a papier-mâché sabot, with a metallic ring at top, and a ring and disk of metal at the base to protect it, substantially in the manner described.

No. 45,952.—CHRISTOPHER M. SPENCER, assignor to SPENCER REPEATING RIFLE COMPANY, Boston, Mass.—*Self-loading Fire-arms*.—January 17, 1865.—This invention relates to the magazine for containing the cartridges, which consists of two metallic tubes, the one fitting within the other, the outer tube passing through the stock and opening at the butt, and serving to secure the said stock to the breech portion or receiver, within which tube the cartridges are placed, and the inner and removable tube (closed at its rear end, and containing the feeding spring and follower) passing over the cartridges, as it is pressed within the opening, within which it is secured by a "bayonet-joint" catch when wholly inserted.

Claim.—First, the compound magazine inserted in the stock of the piece, and consisting of two metallic tubes, constructed and operating substantially in the manner described.

Second, in a double tube magazine chamfering the inner side of the forward end of the inner tube F, in the manner and for the purpose described.

Third, the arrangement of the groove *c*, and catch *h*, for conjoint operation, as specified.

Fourth, the combination and arrangement of the cap G, arm H, recess *d*, and pin *d'*, substantially in the manner described.

Fifth, the combination of the receiver B, tube D, nut E, and stock A, in the manner and for the purpose set forth.

No. 45,953.—JAMES CRUTCHETT, Stroud, England.—*Apparatus for Winding Thread from the Skein*.—Patented in England August 23, 1864.—A reel is constructed each of whose arms can be extended as desired, by slides, and all of them can be folded together by means of a central umbrella joint, to which they are radially hinged; the outer ends have each a pivoted curved piece for sustaining the skein. The thumb piece, in connection with a lower disk or flange on the central joint, serves to hold the arms extended for operation, and also by a change of its position to allow the release of the arms, when the same are to be folded up in a compact form. An ordinary winding apparatus is used in connection with the reel for winding the yarn upon spools or into balls.

Claim.—First, the combination of the sliding arms *a a a a a*, figures 1 and 3, with the curved finger *d*, for adjusting the apparatus to the size of the skein, and the folding joint G, for folding the same into a convenient portable form as above described.

Second, the application of the thumb screw, figure 6, with the slots *f f f f f f*, and the projections *g g g g g g*, for the purpose and in the combination above described.

Third, the foregoing arrangement of the reel as illustrated in figures 1, 3, 4, 5, 6, in combination with the winding apparatus represented in figures 7 and 8, all for the purpose above described.

No. 45,954.—CHARLES EMMANUEL, Paris, France.—*Astronomical Instruments*.—January 17, 1865.—The general character of this invention will be evident from the claim. For a detailed description the specification must be referred to.

Claim.—The astronomical instrument herein described, in which a theodolite, an equatorial and an ecliptic instrument are combined, affording the means of ascertaining immediately the position of the heavenly bodies in relation to the horizon, equator, and the ecliptic, substantially in the manner herein set forth.

No. 45,955.—LOUIS EMILE CONSTANT MARTIN, London, England.—*Steam Boiler*.—Patented in England April 28, 1864.—This invention consists in the arrangement of two or more fires in which coal is burned, in combination with one or more retractory hearths, on which incandescent fuel is kept for the purpose of consuming the gases which have been evolved from the coal burned in the primary furnaces.

Claim.—The arrangement of one or more fires substantially in the combination described, to generate the usual products of combustion, with one or more auxiliary incandescent fires, arranged on one or more refractory hearths, substantially as described, through which these usual products are carried, and which, after being transformed into combustible gases, pass through one or more flues into one or more chambers of combustion, where these ultimate gases are ignited, and thus effect a large economy in fuel.

No. 45,956.—HALSEY H. BAKER, New Market, N. J.—*Fire Bank*.—January 17, 1865.—This invention consists of a device for regulating the combustion in stoves so as to preserve the fire alive at a small expenditure of fuel. It is composed of two semicircular plates of metal, hinged in the middle, and made to double up by the force of gravity alone so as to go into the stove door. In these plates are draught holes, closed by dampers; on top is a loop or staple in which to insert a poker to handle it by.

Claim.—First, a fire bank composed of a plate, or combination of plates, fitted to the fire-pot or fire-box of a stove, range, or furnace, to lie upon the fire, substantially as herein described.

Second, providing such a fire bank with one or more openings and valves or shutters, substantially as and for the purpose herein described.

Third, the construction of such a fire bank of two or more plates hinged together in such a manner as to fold substantially as herein described for the purpose of enabling it to pass through the door of a stove or furnace.

Fourth, providing such a fire bank with a hook or loop *i*, so applied in combination with a hinge or hinges that it will fold by gravitation when suspended by said hook or loop, substantially as and for the purpose herein set forth.

No. 45,957.—W. B. BILLINGS, New York, N. Y.—*Coal-oil Stove*.—January 17, 1865.—This invention consists in the combination of the coal-oil lamp, for which a patent was granted to the said Billings in October, 1864, with a cooking stove or range. The lamp is set under the stove. The wick tubes pass up through an air-chamber formed between two diaphragms into cones or deflectors in the top diaphragm, which is the bottom of the stove. The under diaphragm or the sides of the chamber may be finely perforated, or the air-chamber may be filled with some non-conducting substance through which sufficient apertures admit necessary circulation.

Claim.—First, the use and adaptation of the body or sides of the stove or range D, to serve as and perform the office of a flue or chimney over the lamp or oil-holder A, substantially as described and for the purposes set forth.

Second, the attaching of one or more air guides, cones, or deflectors in the diaphragm C, and the adjustment of the same in the stove or range F, substantially as described and for the purposes set forth.

Third, the arrangement of the diaphragms C and *g g*, thus forming an air-chamber between the oil-holder and stove or range, substantially as described and for the purposes set forth.

Fourth, a non-conductor of heat used as packing between the stove and the oil-holder, arranged substantially as described and set forth.

Fifth, the insulation of the lamp or oil-holder by non-contact with the heater, stove, or range, substantially as described and set forth.

No. 45,958.—JOSEPH C. BIRD, Rising Sun, Md.—*Safety Brakes for Horse-powers*.—January 17, 1865.—This invention consists of a stop or catch, above which the lever which holds up the brake cannot be elevated, so that the brake cannot be applied in any other way than by the parting or flying off of the belt, entirely obviating the liability of the jarring of the machine, throwing upwards or outwards the lever or trigger, and thus letting down the brake upon the driving wheel.

Claim.—In combination with the trigger or lever D, the stop or catch which prevents it from rising beyond a given point, which would otherwise apply the brake without the parting or flying off of the belt, substantially as herein described.

No. 45,959.—T. G. CROSBY, Buffalo, N. Y., assignor to BUSHNELL STRONG and MAJORIE H. CROSBY.—*Rudder*.—January 17, 1865.—This rudder is formed with concave sides, the hollow part of which is vertical, extending through the blade.

Claim.—Constructing a rudder for vessels with concave sides, as herein substantially set forth.

No. 45,960.—THOMAS HOPKINS, Cincinnati, Ohio.—*Apparatus for Rendering Lard*.—January 17, 1865.—This invention consists in providing the caldron of a rendering apparatus with a colander, in which the fat is placed, so that it can be lifted bodily out when sufficiently cooked, and also in providing the caldron with a dipper having a valve, so that it can be readily emptied when lifted out of the caldron. To enable the dipper to be removed with facility, a crane is provided, which is supported by the base, which may be moved along a bar, the top of the crane being held in position by means of a block and notches. There is also attached to the apparatus a grapple, composed of a perforated plate, fingers, and hooks, to facilitate the handling of barrels, &c.

Claim.—First, the colander C c c', formed and adapted to operate as set forth.

Second, the dipper D D', d d', d'', formed and adapted to operate as set forth.

Third, in the described combination, the devices F G G', g, H K, and L', or their equivalents, for enabling a crane to be shifted from place to place.

Fourth, the grapple T U U', v, V, w, W X Y Z Z', formed and operating substantially as set forth.

No. 45,961.—G. A. LEIBIG and E. K. COOPER, Baltimore, Md.—*Manufacturing Fertilizing Phosphates*.—January 17, 1865.—This invention consists in heating or roasting the native phosphate of iron or alumina with lime, caustic soda, carbonate of soda, or sulphate of soda or equivalent salt, so as to produce a soluble phosphate.

Claim.—The process, substantially as described above, for producing a fertilizing phosphate containing soluble phosphates.

No. 45,962.—CHARLES ABEL, New York, N. Y.—*Hoisting Machines*.—January 24, 1865.—This invention consists in the application of screw gearing in the construction of a hoisting machine, in such manner as to cause the threads of a screw to act as a stop or check to a windlass wheel, and thus to readily transform velocity into power, and cause the load to be securely held at every point of its elevation.

Claim.—The construction and use of the worm wheel D, with its connected wheel E and worm screw C, in combination with the pulley A, substantially as and for the purpose described.

No. 45,963.—EDWARD ANDREWS, Palo Alto, Penn.—*Shutter Bolts*.—January 24, 1865.—

This invention consists in passing over the bolt a sliding yoke or stirrup, which, by means of a spring, catches into a notch in and holds the bolt when it is thrown back. This stirrup is fastened at its under end to a lever secured at the back of the bolt, and projecting a short distance beyond the rebate on the shutter. When the opposite shutter closes against this lever it compresses the spring, throws the yoke out of the notch, and releases the bolt, which, by means of the spiral spring in its rear, shoots forward and secures the shutter.

Claim.—The combination and arrangement of the bolt B, the latch D, lever F, and spring E and J, when used for the purpose herein fully described.

No. 45,964.—PHINEAS BALL, Worcester, Mass.—*Tapping Water Pipe*.—January 24, 1865.—This invention consists in a clamp formed of two half rings, with lugs at the ends of each half for securing them together. One of the rings is furnished with a radial socket projecting from its periphery, into which, when the ring is applied to the pipe, with packing between, a straight joint cock is inserted, through which a drill can operate to bore the pipe, after which operation the drill is withdrawn, and the branch pipe inserted in said cock, or attached thereto.

Claim.—First, the combination of the clamping irons H H' with the pipe A, tap holder D, and tap c, substantially as and for the purpose described.

Second, the combination of the clamping iron H with tap holder D and tap C, substantially as and for the purposes described.

Third, the combination of the packing I with the pipe A, tap holder D, and tap C, substantially as and for the purposes described.

No. 45,965.—STEPHEN T. BISHOP and ANDREW STEVELY, Fond du Lac, Wis.—*Horse-power Elevator and Excavator*.—January 24, 1865.—This invention consists, first, in combining a tread horse-power with an endless chain excavator and elevator; second, in a peculiar construction and arrangement of horse-power excavator and elevator, all embraced in a single machine for grading railroads, and for other purposes.

Claim.—First, the combination of a tread horse-power with an endless chain excavator and elevator, substantially as set forth.

Second, the adjustable frame E, or its equivalent, in combination with the tread horse-power frame, substantially as specified.

Third, the machine constructed and arranged substantially as described.

No. 45,966.—STEPHEN T. BISHOP and ANDREW STEVELY, Fond du Lac, Wis.—*Horse-power Elevator and Excavator*.—January 24, 1865.—This invention consists, first, in so constructing and arranging a horse-power elevator and excavator as to render the machine movable, and a horse upon the same; and, second, in a peculiar arrangement of gear wheels in connection with travelling or ground wheels, for moving said machine with a horse-power upon it.

Claim.—First, so constructing and arranging a horse-power elevator and excavator as to render the machine movable with the horse upon the same, substantially in the manner and for the purposes set forth.

Second, the above described arrangement of the wheels U and V in combination with the two sets of wheels R and S, substantially as specified.

No. 45,967.—STEPHEN T. BISHOP and ANDREW STEVELY, Fond du Lac, Wis.—*Horse-power Elevator and Excavator*.—January 24, 1865.—This invention consists in certain peculiar arrangements of hooks and buckets upon an endless chain for use in excavating and elevating earth in grading railroads, &c.

Claim.—First, the combination of the hook L with the bars I and the endless chain, substantially as described.

Second, the use of the bar I for attaching the hooks or buckets, or both, to the endless chain, substantially as described.

Third, the arrangement of hooks upon one part of the bar I, and at the same time putting a bucket or buckets upon the other part or end of the bar, substantially as described.

Fourth, the arrangement of the hooks and buckets alternately upon successive bars I, substantially in the manner and for the purpose set forth.

No. 45,968.—STEPHEN T. BISHOP and ANDREW STEVELY, Fond du Lac, Wis.—*Horse-power Elevator and Excavator*.—January 24, 1865.—This invention consists in certain arrangements for elevating and depressing an endless chain and pulley for excavating earth in grading railroads, &c.

Claim.—First, the adjustable frame C in combination with the horse-power, substantially as set forth.

Second, the arrangement of the ratchet wheels as shown in Figs. 1 and 3, in combination with the crank N and frame E, substantially in the manner and for the purposes set forth.

Third, the combination of the ratchet wheels and crank N with the ratchet bar, Fig. 3, substantially in the manner and for the purposes described.

No. 45,969.—WILLIAM BREITENSTEIN, New York, N. Y.—*Looms*.—January 24, 1865.—This invention relates to that class of looms in which the shuttle is carried by a holder half-way across the warp, and is there delivered to a corresponding holder which carries it past and out of the other half. The novelty consists in the use of sliding bars carrying shuttle holders, so made as to open and shut, and thus seize and discharge the shuttle; other sliding bars, operated by these, acting by means of slotted inclines and levers to open and shut the holders. A shield plate on each shuttle holder prevents the warp threads from getting within the arms or jaws of the holders.

Claim.—First, the arrangement and construction of the sliding bars C C', provided with suitable arms at their ends forming the shuttle holders, and operated in the manner and for the purpose substantially as set forth and described.

Second, the construction of the shuttle holders and the arrangement of the arm *m*, operated by a spring *o*, and acted upon by the lever G or G', in the manner and for the purpose described.

Third, the arrangement and combination with a shuttle holder of the shield plate F, in the manner and for the purpose set forth.

Fourth, the sliding bar H in combination with the levers G G' G' G', constructed and operated in the manner and for the purpose specified.

Fifth, the arrangement of the hook levers N N', with their springs *r r'* attached to sliding bar H, in combination with springs *s s'* attached to the breast beam B, and acted upon by the arms *p p'* of the sliding bar C C', for the purpose of operating said sliding bar H, in the manner substantially as set forth and described.

No. 45,970.—P. S. BREWSTER and C. M. HINES, Lime Hill, Penn.—*Stone Gatherer*.—January 24, 1865.—This invention consists of a rectangular frame mounted on rollers near the front end of the frame. At about the centre of the frame is a cross-bar, having journals which have their bearings in the side pieces of the frame. To this cross-bar are curved teeth secured and run upon the ground for the purpose of gathering the stones. When the teeth are loaded they are thrown back by means of a lever and deposited upon a platform in the rear.

Claim.—First, the pivoted bar C provided with gathering fingers *c*, and operated by means of the bail H, levers F, and rods E G, substantially in the manner herein described.

Second, the platform E in combination with the lock bar A a', spring *a2*, and plate D', when the whole are employed in conjunction with the gatherers C c, in the manner and for the purposes explained.

Third, in combination with the gatherer C c, the rollers B B extending across the machine to raise the fingers over stones too large to be lifted by them, substantially as set forth.

No. 45,971.—GEORGE BUNCH, Grand River township, Mo., and JAMES A. PRICE, Breckenridge, Mo.—*Corn Planter*.—January 24, 1865.—This invention consists in a triangular frame, the rear end being supported on wheels. Above the frame and over the wheels is a shaft extending across the frame, on each end of which are seed cells, which are worked back and forth by the right handle, thus discharging a given quantity of seed at each motion.

Claim.—The sliding handle I and sliding bar H connected together and applied to the frame A and shaft D, substantially as and for the purpose herein set forth.

No. 45,972.—CALEB CADWELL, Wankegan, Ill.—*Sewing Machines*.—January 24, 1865.—This machine is of a shape adapted to sewing tubular goods, and is designed for quilting and other sewing in square or rectangular figures, the feed dog being, by a novel system of mechanism, so operated as to feed forward or backward, and crosswise and return. The shutter is carried in a sliding frame, and a thread catcher in the raceway assists in carrying the loop over the shuttle. The thread-winding apparatus differs from those in use by locking itself when placed in and out of contact with the driving wheel by means of a fixed spring and a projection.

Claim.—First, the slide E having a groove *e'* to actuate the pin *f'* on the thread catcher F f, which guides the thread around the shuttle, substantially as described.

Second, the pivoted bar P for taking up the slack thread when operating in combination with the flipper P' and projection *k'*, in the manner herein set forth.

Third, the tension device Q2 Q4 Q5 and the pin Q2 for the spool, all mounted upon the spindle Q3 on the arm D, so that they may be removed and replaced at will.

Fourth, the adjustable block *h3* and circular block H2 in combination with the notched aperture, for imparting a variable movement to the feed surface H, the whole being operated by means substantially as herein described.

Fifth, the combination of the circular blocks H7 H8, the former, H7, being moved vertically by turning on the latter, H8, so as to raise and lower the feed surface, in the manner and for the purpose set forth.

Sixth, the thread-winding apparatus R R1 R2 R3 *r* operating in connection with a spring S, whereby it is held down to work in connection with the driving wheel B, or retained out of contact therewith, as stated.

No. 45,973.—ANSEL CAIN, Holyoke, Mass.—*Means of Working Ships' Pumps.*—January 24, 1865.—A pendulum suspended from the top bar of a frame carries near its weighted lower end two segmental ratchets, the lower one being toothed on its concave and upper side, and the upper toothed on its convex or lower side. These teeth engage with pinions, forming parts of sleeves on one shaft, said sleeves being geared to disks, rigidly attached to the shaft, so as by an obvious arrangement of the gearing to obtain a continuous revolution of the shaft from the oscillating movement of the pendulum. The ship's pump is operated by a crank arrangement at the end of the shaft.

Claim.—Operating the pumping apparatus of a ship or vessel by means of an oscillating weight, in combination with the mechanism described, the whole arranged substantially as set forth.

No. 45,974.—CYRUS CHAMBERS, jr., Philadelphia, Penn.—*Duster for Brick Machines.*—January 24, 1865.—This invention, which relates to that class of brick machines in which the bricks are borne off on an endless apron, consists in placing on the latter a box in which sand or dust is kept in suspension, so that the bricks, as they pass through said chamber, become thoroughly covered on every side with the suspended sand or dust. The machine chiefly consists of a chamber or box, surmounted by a reservoir or hopper, from which the sand is constantly supplied, and by two hollow cones thrown upon every side of the bricks as they pass through the chamber.

Claim.—First, applying sand or dust to the surface of undried bricks in a chamber in which those materials, or either of them, are kept in suspension by mechanical means.

Second, passing bricks as they come from a brick machine through a box or chamber in which sand or dust is kept in suspension by mechanical means, substantially in the manner and for the purpose described.

Third, the use, in a dusting apparatus, of the cones P, constructed and operating substantially as described, for giving direction to currents of sand or dust, for the purpose specified.

No. 45,975.—J. H. CHAMPLIN, Essex, Conn.—*Railroad Car Brakes.*—January 24, 1865.—This invention relates to that portion of a railroad-car brake employed to create friction upon the wheels, and consists in the employment of stone or other mineral substance in the construction of the friction block.

Claim.—A friction block for railroad-car brakes, formed from stone or its equivalent, combined with and made adjustable by means of the screws *a a* in the case D, and arranged to operate substantially in the manner and for the purpose specified.

No. 45,976.—OTIS N. CHASE, Boston, Mass.—*Combined Seed and Potato Planter.*—January 24, 1865; antedated January 8, 1865.—This invention consists of a frame hanging upon an axle, to the upper part of which frame the motive power is applied, and the lower part carrying one or more ploughs, which open the ground for the seed and cover it again with wings attached to its rear. The upper and lower parts of this frame are connected by a toggle lever, which elevates or depresses the plough. A large wheel, having in its periphery seed cavities, varied in depth by screws, passes through the bottom of the seed box. Different wheels may be used for different kinds of seeds. The seed box has at its bottom an inclined plane, to which a vibratory motion may be given by projections upon the seed wheel. A small portion of the box is removed in front to allow the passage of the seed, and springs are placed upon each side of the opening. For planting potatoes, curved knives are inserted in the periphery of the wheel, and made adjustable by means of set screws. These knives carry the potato from the seed box to the rear of the plough, where they are removed by a slit in the attached conveyor.

Claim.—First, the combination and arrangement of the toggle lever *d* and the frames A and C with one or more ploughs, substantially as described.

Second, the projections represented by the knives or hooks *ff*, &c., in combination with the stripping slot *i*, or its equivalent, substantially as described, for the purpose set forth.

Third, the combination and arrangement of the springs *jj*, inclined plane *g*, and seed box H, with the projections, as represented by the knives or hooks *ff*, &c., substantially as described, for the purpose set forth.

No. 45,977.—LUCIUS E. CHITTENDEN, Washington, D. C.—*Material for the Manufacture of Buttons, Handles for Knives, and other purposes.*—January 24, 1865.—This invention consists in the use of the interior of the shells of the animals known as fresh-water clams, or muscles, for the manufacture of buttons.

Claim.—The manufacture of the articles above named, and the use, in whole or in part, for such manufacture, of the interior or nacreous portion of the shells of the fresh-water molluscous animals of the United States and North and South America, substantially in the manner above described, or in any other, substantially the same, which will produce the intended result or effect.

No. 45,978.—ELLIOT H. CRANE, Jonesville, Mich.—*Leather-channelling Tool.*—January 24, 1865.—The object of this invention is to facilitate the cutting of V-shaped channels upon the edges of harness straps, boots, and shoe soles. It consists chiefly in a metallic shank,

having a handle attached. At the other end there are two adjustable cutters which intersect each other. A gauge is adjusted to or from the shank, by which the distance from the edge of the leather may be regulated at will.

Claim.—The combination of the adjustable gauge G with the shank A, substantially in the manner herein shown and described.

Also, the combination of the block C and cutter B' with the shank A, substantially as herein shown and described.

Also, the combination of the cutter F with the cutter B, block C, and shank A, substantially as herein shown and described.

Also, the combination of the gauge G with the block C, cutters B F, and shank A, substantially in the manner herein shown and described.

No. 45,979.—JOHN P. CULVER, New York, N. Y.—*Hooks and Eyes.*—January 24, 1865.—The beak of the hook is broad and flattened, the bend being narrow. The eye is narrow transversely, and long in the direction of the line of attachment. To insert the hook it must be presented laterally, or at an angle to the eye.

Claim.—A hook and eye, combining the widening *e* of the bill of the hook with the narrower opening *b* of the eye, substantially as and for the purpose herein specified.

No. 45,980.—CHARLES DISSTON, Philadelphia, Penn.—*Method of attaching Handles to Cross-cut Saws.*—January 24, 1865.—This invention consists in a handle provided with ferrules and side straps, a plate being placed in a slot to receive the saw, on the upper edge of which are projections to fit in notches made in the lower edge of the saw; this plate hanging on a pivot passing through the handles, strap, and plate, so that when the saw plate is placed in the slot of the handle, the plate will incline, and receive the projection of the plate in the notches of the saw, in which position the saw is secured by driving a wedge over the saw.

Claim.—First, the handle A, its ferrule *c* and strips *b*, the key F and self-adjusting plate D, the whole being constructed and arranged for attachment to the end of the saw, substantially as described.

Second, the self-adjusting plate D, hung to the strips *b*, and having projections *e e*, adapted to notches in the edge of the saw, all as set forth.

No. 45,981.—WILLIAM H. DOANE, Cincinnati, Ohio.—*Scroll Saws.*—January 24, 1865.—This invention consists in providing in a scroll sawing machine a tubular stock, in which the saw plays, and at the lower end of which is placed a guide for the saw of hardened steel plates at the back and sides of the saw. This stock is also provided with a door at its lower end, and also in a tubular sleeve, through which the saw stock passes and is held at any desired height, all forming a compact and easily adjusted arrangement.

Claim.—First, the combination of the devices A B C *a b*, the same being adapted for and constituting a portion of a scroll sawing machine or saw-mill, substantially as herein set forth.

Second, the combination of the tubular sleeve C, key *c*, screw *d*, recessed or tubular shank *e*, and guide stock D, substantially as and for the purpose set forth.

Third, a tubular foot stock D, with a guide holder D' on its lower end, the said holder being constructed and having guides fitted upon it, substantially as and for the purpose set forth.

Fourth, the combination of the tubular sleeve C, the stock D, feather *c*, and set screw *d*, substantially in the manner and for the purpose described.

Fifth, the employment of a door E, or its equivalent, in combination with a foot stock D D', substantially as and for the purpose described.

No. 45,982.—PORTER DODGE, Perkinsville, Vt.—*Joining and Fitting Corners of Soapstone Stoves.*—January 24, 1865.—The ends of the stove have grooves, into which the sides of an angular iron plate are fitted. The plate is secured by tenons to the top and bottom of the stove. An open-work metallic cap fastened to the plate covers it and the ends of the stove.

Claim.—In combination with the grooved soapstone slabs A, the iron or metal corner or angular plate B, substantially as and for the purposes described.

Also, in combination with the grooved soapstone slabs A and angular plate B, the cap C, substantially as and for the purpose specified.

No. 45,983.—WILLIAM C. DODGE, of Washington, D. C.—*Revolving Fire-arms.*—January 24, 1865.—The frame of the arm is jointed so as to allow the barrel and cylinder to swing to one side, or the barrel to swing to one side of the cylinder, for exposing one end of the said cylinder, to permit the action of a cartridge retractor; and the improvement consists in mounting the cylinder on a tubular pin rigidly attached to the frame at one end, and in a particular arrangement of latching device for locking the movable frame securely in its closed position.

Claim.—First, the sliding lock-bolt *q* arranged in bridge piece *p* as shown and described, whereby the parts can be locked automatically, and can be unlocked and swung over by a single application of the thumb, and the whole operation performed by the use of one hand only.

Second, hanging the cylinder on the tubular bolt *g*, or hollow journal *h*, when connected by the frame at one end only, whether at the front or rear.

Third, supporting the detached end of the cylinder by the projection *i* and groove *j*, substantially as specified.

Fourth, locking the projection *i* in place by the latch *k*, or its equivalent, substantially as shown and described.

Fifth, so arranging bolt *l* and latch *k* that both can be operated simultaneously and by a single movement.

Sixth, constructing and arranging bolt *l* and latch *k* in such a manner as to permit the front and rear portions of the frame to be locked automatically, as they are swung into position for firing, whereby the use of one hand only is required in the operation.

No. 45,984.—A. ELIAERS, Boston, Mass.—*Elastic Studs for Doors*.—January 24, 1865.—This invention is applicable to doors, French windows, &c., where two swinging edges or surfaces are brought in contact with each other, its object being to prevent noise or jar and to hold the parts in proper relative positions. The invention consists in the use of two or more elastic studs or buttons, working or rubbing against each other in the ends or edges respectively of the swinging, sliding, or otherwise movable part and the stationary rebate or jamb.

Claim.—First, my improvement in the construction of doors, French windows, &c., which consists in the use of two or more elastic studs or buttons, working or rubbing against each other respectively in the ends or edges of the swinging, sliding, or otherwise movable part, and the stationary rebate or jamb, as described.

Second, the combination of the elastic studs or buttons, operating together, as described, and one or more elastic studs or buttons placed in the rear of the first set of studs or buttons, the whole serving to prevent noise and to hold in position, as set forth.

No. 45,985.—EDWIN ESTABROOK, Jersey City, N. J.—*Explosive Shell*.—January 24, 1865.—The interior cavity of the shell is bounded by plane sides in the form of a regular polyhedron. It is found that there are "planes of weakness" radiating from the axis of the shell cast in this way, along which the tendency is to yield to the force of the explosion of the charge, whereby the shell is caused to divide itself into pieces of nearly uniform size and corresponding in number to the faces of the cavity. Much greater destruction is supposed to be effected in this way than follows the explosion of ordinary shells.

Claim.—The plane or nearly plane faces *B*¹, *B*², &c., on the interior of an explosive shell, arranged relatively to each other in the manner and so as to produce the effect herein set forth.

No. 45,986.—EDWIN ESTABROOK, Jersey City, N. J.—*Fuze for Shells*.—January 24, 1865.—This invention consists in making the inner end of a metallic fuze so thin that it will collapse by the bursting charge, or close, thus economizing and strengthening the rupturing force.

Claim.—The employment in explosive shells of a fuze plug, adapted to collapse and crush by the action of the exploding charge and to stop the escape of gas through the fuze plug, substantially as herein set forth.

No. 45,987.—J. W. FAWKES, Decatur, Ill.—*Cultivator*.—January 24, 1865.—The frame is pivoted near its rear to the axle, and is moved laterally by a T-shaped foot lever, working upon the draught-pole. The teeth are drawn up from the ground by a short lever attached to a segment, over which works a linked or jointed rod. This segment is held back of a wooden pin. The ends of short levers are fastened up by leather straps when the ploughs are not in use.

Claim.—The frame *E* applied to the draught-pole *C*, as shown, in connection with the foot-levers *H* *G*, arranged with the frame, to admit of the latter being operated as and for the purpose specified.

Also, the pivoted plough standards *J* connected to segments *M* by bars *L* and links *J*, in connection with the wooden pins *l* in the segments, all arranged substantially as and for the purpose set forth.

Also, providing the segments *M* with handles *N* in connection with straps *O* on the frame *E*, as and for the purpose set forth.

No. 45,988.—W. H. FREEMAN, Bloomfield, Iowa.—*Gang Plough*.—January 24, 1865.—This invention relates to the combination and arrangement of adjustable plough beams within the frame of the machine, whereby the driver from his seat can regulate the depth of the ploughs as well as their inclination or pitch.

Claim.—In combination with the stationary frame *A*, the hinged plough-beam or beams *F* and levers *G*, *I*, and *H*, for the purpose of adjusting the height as well as the inclination of the ploughs, substantially in the manner and for the purposes described.

No. 45,989.—DWIGHT B. FULLER, Buffalo, N. Y.—*Piston Packing for Pumps*.—January 24, 1865.—To form a pump piston, a disk is fixed at the end of the rod with a movable disk above or behind it, the latter being held to duty by a screw nut. Between these disks there

is a cup-shaped packing made of leather, within the cup of which is a disk of soft rubber. As the leather packing wears loose, it may be pressed out by screwing the moving disk down against the rubber disk, which disk is always protected from wear and other injury.

Claim.—The combination of the follower E, elastic disk G, and leather bonnet H, for the purposes and substantially as described.

No. 45,990.—SQUIRE GAMBELL, Otisco, N. Y.—*Washing Machine.*—January 24, 1865.—This invention consists in the employment of a suspended oscillating suds-box of semi-cylindrical form, in connection with a fixed or stationary dash-board attached to the suds-box.

Claim.—The oscillating suds-box A provided with the horizontal slats *g* and wash-board F, in combination with the fixed or stationary dash-board E, all arranged substantially as and for the purpose set forth.

Also, the pivot-bar G with upright lip K attached, in connection with the projections I, one or more, on the exterior of the suds-box, for the purpose specified.

No. 45,991.—E. P. GARDINER, New York.—*Apparatus for Desulphurizing and Amalgamating Ores.*—January 24, 1865.—This invention consists of a furnace made of brick or iron and supporting a vertical cylinder. The cylinder is provided with a shaft, to which is keyed a perforated diaphragm, the shaft being also provided with agitating arms, as shown. From the lower part of the cylinder extends a channel connecting with a vertical pipe, which is provided with a feed screw, the said pipe having a funnel attached to it near the top. The cylinder is supplied with mercury from a reservoir by means of a pipe. From the upper part of the cylinder extends a pipe which terminates in a condensing tube, the said condensing tube being provided with a shaft and agitators. The top of the cylinder is provided with a channel through which cold water is caused to circulate, the waste being carried off by a pipe into a condensing tube. Rotary motion is imparted to the shafts by means of suitable gearing.

Claim.—First, the form and construction of the receiving and operating vessel F, by which it is to be adapted to the uses and purposes required and designed, as above described.

Second, the vertical shaft and its attachments of pins and revolving perforated diaphragm plate, combined, arranged, and operating within the vessel F, in the manner and for the purposes described.

Third, the combination and arrangement of the operating vessel F, the feed-pipe and endless screw I K, and the eduction or discharge pipe P, and the rotation of the shaft and attachments, operating as described, so as to effect a continuous and uninterrupted operation of the process, without stopping to charge or discharge the matter under treatment.

Fourth, the combining and arranging the vessel F and the apparatus connected with it and its contents with the washing tub or condenser and separator by means of educting pipe P and water pipe Y, operating together as described.

Fifth, desulphurizing the dust and dissolving the sulphur therein contained by subjecting the same to treatment with heated mercury, in a vessel in which the atmosphere or external air is admitted with the pulp, and uniting the fumes of the mercury with the fumes of the sulphur as they pass off within a vessel arranged, constructed, and operating as described.

Sixth, the construction of the water trough in the head of the operating trough, provided with a supply and discharge pipe for keeping cool the head and stuffing box, constructed and arranged and operating as described.

No. 45,992.—W. C. GIFFORD, Jamestown, N. Y.—*Hay Spreaders.*—January 24, 1865.—This invention consists in the employment of a reel, provided with suitable rakes, the bearings of which reel are secured to a tilting frame which is pivoted to the main frame and is adjustable at any height by means of a hook and chain in front. The reel is rotated by a belt passing around a drum upon one of the wheels, two pulleys secured to a hand lever, and a pulley upon the axle of the reel. The hand lever moves upon the same pivot as the tilting frame, and, the pulleys being secured to it, secures both the tilting of the frame and the same tension of belt at any height of the frame. The belt is tightened by means of a serrated bar and catch attached to the frame. The rakes are held in proper working position by means of chains at their centres and teeth passing through their extremities and nearly to the centre-shaft, where they are held in position by spring stops, which stops are depressed at the proper time by cams, thereby forcing the teeth and allowing the rakes to revolve and release the hay. The thills are also made adjustable in length by being secured to the main frame by loops and pins passing through holes in said loops and thills.

Claim.—First, the draught pole or thills D, provided with a series of holes *d**, and operating in combination with the pins *d*, loops *b b'*, and cross-bars *c c'*, of the frame A, in such a manner that the same can be readily taken out and changed, or lengthened or shortened, as may be desirable.

Second, the combination of the tilting frame F with the reel E and chain *h*, substantially as and for the purposes shown and described.

Third, the hand lever G in combination with the belt *i* and tilting frame F, applied as herein set forth, so that by touching the hand lever the belt and lever combined will raise or lower the frame.

Fourth, the serrated bar *m* and catch *m'*, in combination with the lever *G* and belt *i*, as and for the purposes specified.

Fifth, the rakes *H*, provided with teeth *p p** and applied to the reel *E*, in combination with the chains *p'*, spring stops *q*, and cam *q'*, or their equivalents, constructed and operating substantially as and for the purpose shown and described.

No. 45,993.—HORACE N. GOODRICH, Aurora, Ill.—*Grain Separator*.—January 24, 1865.—The lower edge of a movable hopper is provided with feed regulating boards that allow a large opening for the passage of cobs and large substances, and still prevent the too rapid passage of the grain. In the gang of sieves two or more are adjustable and provided with a like feed regulator. The shoes are provided with grooves running into each other so as to allow the sieves to be set at different angles without being entirely removed.

Claim.—First, providing the hopper with the feed-regulating boards *B*, substantially as and for the purpose specified.

Second, the stationary strip or feed-regulator *E*, when constructed and operating as and for the purposes set forth.

Third, the gang of series *F*, with two or more of the sieves in the gang adjustable, and provided with the feed-regulator *E*, substantially as and for the purpose herein described.

Fourth, providing the shoes *G* with the grooves *I*, so running into each other that a sieve or screen can be changed to different angles of inclination without being removed from the shoes, substantially as and for the purpose set forth.

No. 45,994.—JACOB HAEGE, Shiloh, Ill.—*Cask for Preserving Beer, &c.*—January 24, 1865.—This invention consists of a vessel resting upon a block from which rise two side pieces, having cross-bars above. The said vessel is held in place by means of screw clamps, and is closed by means of a head, which is composed of two plates, which compress between their edges a ring of elastic packing. The plates are held together by means of screw bolts which pass loosely through the upper plate, and are securely screwed into the lower one. The two plates may be drawn together, and the ring made to expand by means of a left-hand screw thread on the lower end of the piston rod. The piston may be forced down upon the liquid by means of a common screw thread upon the upper part of the piston rod and a hand nut.

Claim.—The combination of the piston *G*, and its screw *c*, with the plates *x x'*, and packing *F*, substantially in the manner herein shown and described, so that by revolving the said piston rod the periphery of the piston will be expanded or contracted, all as specified.

The employment of the ratcheted nut *I*, in combination with the screw piston rod *G*, and piston *E*, substantially as herein shown and described.

The construction of the plate *x'*, with cavities to receive the screws, substantially as and for the purpose herein shown and described.

No. 45,995.—JOHN HANES, Polkville, Ky.—*Ploughs*.—January 24, 1865.—In this plough the sole standard and brace are constructed of one piece, and the beam and handles attached at two single points.

Claim.—Forming the plough stock—that is, the curved front bar *b*, ground bar *a*, and brace *c*—in one piece, in combination with the manner herein described and shown of adjusting the same to the beam *B*, and handles *R*, through the intermediary of the brace *P*, and cross bar *W*, substantially as set forth.

No. 45,996.—MARK HAYS, Worcester, Mass.—*Sap Spile*.—January 24, 1865.—This invention consists of having a screw at one end for the purpose of screwing into the tree, the other end being slightly conical in form; near the centre there is a circumferential groove made for holding the bucket which receives the sap, so that the former will be close to the spile, and the sap prevented from being blown over the edge of the same, and one which will prevent the leakage of sap from the tree around the spile.

Claim.—A tubular sap spile, provided or formed with a screw to screw into the tree, a circumferential groove extending wholly or partially around the spile to receive the handle of the pail which receives the sap, and a square, *b*, to receive a wrench to screw the spile into the tree, substantially as herein shown and described.

No. 45,997.—CLARK R. HEWETT, Waupun, Wis.—*Straw Cutter*.—January 24, 1865.—In this invention two straight knives rotate in an elliptical frame moved by a cog-wheel in its hub connected with the shaft of the feed roller. A stationary knife is kept in position with a spring and wedges just outside and parallel with the feed roller.

Claim.—The combination of the rotary knives *L L*, hub *K*, braces *ll*, stationary knife *E*, and feed roller *c c'*, all constructed, arranged, and operating substantially as and for the purposes specified.

Also, the adjusting of the knife *E*, by means of the sliding wedge *F*, arranged substantially as and for the purpose specified.

Also, the spring *g*, when applied to the knife *E*, and used in combination with the rotary knives *L L*, substantially as and for the purpose set forth.

No. 45,998.—JAMES H. HOFFMAN, New York, N. Y.—*Turn-down Enamelled Paper Collar*.—January 24, 1865.—This invention consists in the use of linen paper, and an enamel on one surface, to form the turn-down collar; that is to say, by cleaning the linen paper to open its pores and applying thereto in a warm state a composition of white wax and a trace of ultramarine. The union between the enamel and paper becomes so perfect that the paper thus prepared, after being polished on its enamelled surface, can be bent without fracturing the fibre of the paper or injuring the enamel.

Claim.—The new article of manufacture herein described, constituting a turn-down or folded collar, made and finished in the manner and for the purpose set forth.

No. 45,999.—ELLIS A. HOLLINGSWORTH, South Braintree, Mass.—*Machine for Folding Paper Bags*.—January 24, 1865.—This invention consists of a machine to fold the bottom of paper bags, which is effected by stretchers to expand two sides, while the bottom is folded on itself by hinged flaps moving transversely to the stretchers.

Claim.—The combination of the stretchers K K, or their mechanical equivalents, with the leaves or flaps g g, the whole being so as to operate together substantially in manner and for the purpose or objects described.

Also, in combination with the two leaves g g, and their elevating mechanism as described, the opening bars h h, applied to the leaves and the posts, substantially as and so as to operate as set forth.

No. 46,000.—FREDERICK W. HOWE, Providence, R. I.—*Rear Sight-base for Fire-arms*.—January 24, 1865.—The rear band, holding stock and barrel together, is composed of two parts or halves. Between projecting lugs on the underside of the stock, the strap loop is swivelled. Between similar ones on the top of the barrel the rear sight is hinged.

Claim.—The employment of a band made of two parts and fitted to a recess or groove in the outer surface of the barrel and stock, and secured as described, in combination with the barrel, stock, and rear-sight as described and for the purpose set forth.

Also, the combination of the said band, made in two parts and fitted to a recess or groove in the barrel and stock, and secured as described, in combination with the back strap swivel, as described and for the purpose set forth.

No. 46,001.—EDWARD HUBER, Kelso, Ind.—*Horse Rake*.—January 24, 1865.—This invention relates to that class of rakes in which the teeth are straight, running upon the ground, and revolving to discharge the load. It consists of spring catches, which retain the rake in working position, preventing its revolution in either direction, but readily releasing them when the load is to be discharged.

Claim.—The spring or elastic plates G, attached to the handles F F, and provided with the projections d e, in connection with the plates H on the teeth of the revolving rake head D, the handles being connected by pivot bolts to pendants B on thills A, and all arranged to operate in the manner substantially as and for the purpose set forth.

No. 46,002.—F. HULLHORST, Freeport, Ill.—*Vegetable Cutter*.—January 24, 1865.—This invention consists in a cutting wheel, and changeable feed boxes, arranged with a suitable case for cutting vegetables of various kinds, for family use or for fodder.

Claim.—The combination of the changeable feed boxes H d I and J f f with the cutting-wheel D G, and casing A, all arranged to operate as specified.

No. 46,003.—F. HULLHORST, Freeport, Ill.—*Bread Cutter*.—January 24, 1865.—This invention is set forth in the claims and engravings.

Claim.—The curved slot G in the plate H, attached to box A, in connection with the knife D, arranged in connection with a slide, lever, pawl, and rack, or their equivalents, to operate the sliding bottom B, substantially as and for the purpose specified.

Also, the adjustable plate O, when applied to the device to operate in connection with the bar N, on the bolt F of the knife D, substantially as and for the purpose set forth.

Also, the guide plates C C, in combination with the knife D and slotted plate H, for the purpose specified.

Also, the adjustable bar N on the bolt F of the knife D, in connection with the cross-head M at the end of the slide I, substantially as and for the purpose set forth.

No. 46,004.—FRITZ JACOB, New York, N. Y.—*Screw Propeller*.—January 24, 1865.—In this propeller the blades are hollow and consist of two leaves, which unite at their extremities, the same being bow or loop shaped.

Claim.—The screw propeller constructed with hollow bow-ended blades B, of the form herein shown and specified and for the object set forth.

No. 46,005.—JULIUS JOHNSON, Baltimore, Md.—*Apparatus for Separating Metallic Filings*.—January 24, 1865.—This invention consists of a box containing a hopper, reservoir, and a revolving apron extending from beneath the hopper to the mouth of the reservoir. A series of temporary magnets are attached to a shaft in such a manner that they may be sus-

pended directly over the surface of the apron. When the machine is in operation the filings are fed in the hopper, and from thence they pass to the apron. The apron carries them forward towards the mouth of the reservoir, and the magnets at the same time are caused to move backward and forward over the surface of the apron, collecting the filings of iron and steel. When the magnets arrive at the mouth of the reservoir, the shaft to which they are attached is caused to revolve, and carries the magnets directly over the mouth of the hopper. While the magnets are in this position the circuit is broken, and the steel and iron filings are allowed to drop into the hopper. The apron carries the filings and dirt which have not been attracted by the magnets to an aperture, where they are discharged.

Claim.—First, the combination of temporary magnets fixed upon a shaft, which is made to traverse back and forth as described, with a travelling apron for carrying the filings to be cleaned, substantially as above set forth.

Second, breaking and re-establishing the circuit between an electrical battery and a series of temporary magnets automatically, by means of the cams *m*, the vertical rack, and the lever *i*, under a mode of operation substantially such as and for the purpose above described.

Third, in combination with the aforesaid lever *c'*, rack 14, and temporary magnets *p*, the separate reservoir *U* and inclined partition *V*, for the reception of the iron and steel filings as explained.

Fourth, the sliding rock shaft *s*, the connecting rods *e*, cranks *f*, and shaft *g*, in combination with the gear-wheel 7, substantially as described.

Fifth, the combination of the segment gear-wheel 5, pinion 4, and shaft 13, for imparting intermittent rotation to the apron *c*, as explained.

Sixth, operating the rack by means of the lever *i* and the pin *h*, on the wheel 7, substantially as described.

No. 46,006.—B. H. LIGHTFOOT, Philadelphia, Penn.—*Method of Oiling Wool.*—January 24, 1865.—This invention consists in the use of refined petroleum, or other oily hydro-carbon, mixed with one-third of its weight of olein oil, or lard oil, for oiling wool.

Claim.—First, the application of prepared petroleum or other oily hydro-carbons to the oiling of the wool.

Second, the application to the oiling of wool of oily hydro-carbons, in combination with olein or lard oil, or other equivalent material.

No. 46,007.—EDWARD MACKEVITZ and WILLIAM FRANK, Milwaukee, Wis.—*Stove-pipe Damper.*—January 24, 1865.—This device is to be placed in a stove-pipe, and consists of two fixed perpendicular partitions, set parallel to each other and extending entirely across the pipe; the lower end of the upper partition extends a little way below the upper end of the lower one; two movable horizontal partitions are fixed at the top and bottom of these fixed partitions, in such a manner that they compel the products of combustion to take a circuitous course before reaching the mouth of the pipe, which pipe is heated by these means.

Claim.—First, the arrangement within a drum or a section of a stove-pipe of the fixed and movable partitions *C D*, and the fixed and movable partitions *C' D'*, in two series, one above another, substantially as above described.

Second, weighting the movable partitions *D D'*, substantially in the manner described.

No. 46,008.—T. MAYHEW, Poughkeepsie, N. Y.—*Photographic Card Mount.*—January 24, 1865.—The improvement consists in coating the card with suitable gum or mucilage; the photograph while damp from the washing bath is placed upon it and pressed, thus reversing the ordinary mode.

Claim.—A photographic card mount, the surface of which is partially or wholly covered with gum or other suitable cement, substantially as and for the purpose set forth.

No. 46,009.—E. C. MARTIN, West Liberty, Iowa.—*Horse Rake.*—January 24, 1865.—The object of this invention is to secure the teeth at such an inclination as will insure the ready performance of their work, while the supports being flexible, the angle of inclination may be changed at will. The invention will be readily understood from the claim and engraving.

Claim.—The combination with a revolving rake *A B B'* of the flexible metallic supports *D D'*, attached at one end and so arranged as to move in contact with the ground behind the rake head, substantially as and for the purpose explained.

No. 46,010.—GEORGE C. MERRILL, Chicago, Ill.—*Lantern.*—January 24, 1865.—This invention consists in providing a lantern base with a circular rack, so as to operate the wick ratchet and raise or lower the wick by rotating the oil cup, without removing it from the lantern.

Claim.—First, operating the wick ratchet in a lantern or lamp by a rotary motion of the oil cup or lantern.

Second, operating the wick ratchet by the rotary motion of a rack or disk. •

Third, the circular rack or disk *a*, when used for the purpose of operating a lantern-wick ratchet.

Fourth, the rack or disk *a*, in combination with the pinion *c*, and wick ratchet *d*.

Fifth, the combination of the rack or disk *a*, the pinion *c*, and ratchet *d*, with the oil cup *C*, and base *B*, all being constructed and operating substantially as set forth and specified.

No. 46,011.—JOHN A. MINOR, Middletown, Conn.—*Pocket Lantern*.—January 24, 1865.—This invention consists in a mode of constructing a pocket lantern, so that when not in use its sides, bottom, and top may be compactly folded together, and again at pleasure unfolded and adjusted for use, embracing also a receptacle for candles and matches.

Claim.—A portable or pocket lantern, constructed with folding sides and a folding top and bottom, substantially as herein shown and described.

Also, having the rear side *b* of the lantern constructed in the form of a narrow or shallow box, provided with receptacles for candles and matches, and having its bottom provided with a pivoted plate to which the candle socket is attached, and arranged so that the candle may be adjusted within the lantern or the box, substantially as herein described.

No. 46,012.—JAMES A. MCPHERSON, Troy, N. Y.—*Ballot Box*.—January 24, 1865.—This ballot box consists of three parts, the ballot receptacle, the cover, and the ballot receiver. In the cover is an opening, closed by a spring valve, operated by a lever projecting from the side of the box. Projecting from the side of the valve is a lug, which operates a lever attached to a bell. The ballot receiver is of glass, and is supported by a frame on the top of the box. The top of the receiver is closed by a cap, which screws into the top. In this cap there is an opening, under which are two inclined plates, which extend down into the box; one of these plates has an edge, against which the ballot, when folded, rests.

Claim.—First, the combination in a ballot box of the body or receptacle *A*³ and the top *A'*, separated by a valve, constructed and applied to each other, substantially as shown.

Second, the top *A'* of the ballot box, composed of an open cylinder with transparent sides, a cover *S*, with its valve and bell and hammer, and a ballot-retaining mouth-piece, substantially as above set forth.

Third, in a ballot box, retaining the ballot in a receiving mouth set within transparent walls, so that it cannot be withdrawn upwards, but remains suspended for inspection until pushed through the mouth by a succeeding ballot substantially as described.

Fourth, the removable mouthpiece 4, constructed so as to retain a ballot suspended in it, and prevent its withdrawal, substantially as above described.

No. 46,013.—WILLIAM MOREHOUSE, Buffalo, N. Y.—*Wood-saw Frames*.—January 24, 1865.—The object of this invention is to provide a frame that will allow a larger log of wood to be sawed before striking the cross-strain bar, and at the same time effectually strain the saw, and it consists in a strain bar that is arched towards the upper part of the frame, between which and the frame is placed a strain and screw, so that by turning the screw one way it presses upon the strain bar in such a way that it presses the ends of the frame asunder, and when turned the reverse way will release the saw from strain.

Claim.—Straining a saw blade *B*, by means of an arched or thrust brace *E*, or its equivalent, constructed and operated substantially as described.

No. 46,014.—J. W. MOYER, Cherry Valley, N. Y.—*Sofa*.—January 24, 1865.—This invention consists in having the ends of the sofa attached to the bottom of a seat by means of hinges or joints, and having said ends constructed and arranged in such a manner that they may be adjusted and secured in an upright or nearly upright position, like the permanent ends of an ordinary sofa, or be capable of being adjusted and secured in a horizontal or less inclined position, so that the sofa may be converted into either a right or left lounge, with an end more or less inclined, as desired.

Claim.—First, a sofa or lounge constructed substantially as described; that is to say, with adjustable end pieces *D D*, provided with sector-shaped supports *F F*, and a locking arrangement, consisting of a pawl *G* and ratchet *H*, so that the supporting sector shall at all times form a brace for the back and hinges, and shall form a continuous back and finish when the ends *D D* are vibrated from their most erect position.

Second, making the end finish on the outside of the front of the seat frame so as to cover the joint of vibration of the end pieces, a portion of the front of the latter vibrating immediately within the end finish.

No. 46,015.—J. W. MOYER, Cherry Valley, N. Y.—*Sawing Machine*.—January 24, 1865.—The saw is suspended between pivoted bearings, on the upper and lower vibrating levers, and its vertical position is secured by slides, working in guides; the threaded straining rods are secured through the said rolling cylindrical bearings. To secure an equal tension upon the saw at all points of its stroke, one of its points of suspension is removed so much further than the other from the axis of vibration as is equal to the versed sine of half the arc described in its vibration.

Claim.—First, the combination of the slides *M M*, moving vertically in guides *f f* and *g g*, respectively, with the screw tension rods *L L* passing through the threaded bearings *b b'*, Fig. 1, by which the saw is preserved from lateral deflection, rendered capable of relative vertical adjustment, and means afforded for the attachment of varying lengths of saws.

Second, the herein described rolling cylindrical bearings *b b b'*, retained by metal straps or boxes *c c c'*, applied above and below the levers *F F'*, respectively, and threaded for the passage of the screw tension rods *K L L*.

Third, the method of hanging the saw from the upper and lower bearings of the straining

rods at *b* and *b'*, Figs. 1 and 3, so that when the levers are horizontal one of the bearings *b'* shall be in a line with the saw, which has a determinate motion by means of its guides, while the other bearing *b* shall be removed an additional distance from its centre of vibration equal to the versed sine of half the arc described by it in its vibrating motion.

No. 46,016.—J. W. MOYER, Cherry Valley, N. Y.—*Coats with Inner Sleeves*.—January 24, 1865.—This invention consists of a sleeve or cuff which buttons around the wrist and is attached to the inside of an ordinary sleeve.

Claim.—As an article of manufacture, a coat with an auxiliary sleeve or cuff B within and secured to the outer sleeve A, as described and represented.

No. 46,017.—ANDREW NARAMOR, Berlin Heights, Ohio—*Hay Rack*.—January 24, 1865.—This invention consists in the arrangement and construction of the several parts composing the rack, and the peculiar mode of attaching the same to the bolster.

Claim.—The construction and arrangement of the bolster C and pieces F, in combination with the rack, as and for the purpose set forth.

No. 46,018.—W. S. NEWTON, Norwich, Conn.—*Hay Elevating Fork*.—January 24, 1865.—This invention will be understood from the claim and engraving.

Claim.—The combination and arrangement of the bar *c*, tang or shank A, with tines and handle attached, semicircular bar D, and catch lever E, with the spring G and rope H connected with it, substantially as and for the purpose herein set forth.

No. 46,019.—A. M. OLDS, Chicago, Ill.—*Coal Screen*.—January 24, 1865.—This invention consists of a coal or ash screen made in the shape of a parallelogram, the axis being passed through it eccentrically, or through diagonal corners. The device may be placed in a box of any shape, but a six-sided one is most convenient.

Claim.—The end coal screen above described, constructed substantially as set forth, and consisting of the closed box A A', the part A being removable, and a screen D revolving eccentrically within the part A', said screen having a door at one end or side, and being so journaled on the part A' of the box as to be removable at pleasure.

No. 46,020.—J. H. PAINE, Hartford, Conn.—*Cut-off for Steam Engines*.—January 24, 1865.—A spiral cam is applied in combination with the governor and main and cut-off valves of a steam engine, so that by its action on the rod of the cut-off valve the steam is cut off instantaneously, or nearly so, and wiredrawing is avoided. The cam being in action but a short space of time, leaves the governor free during the greater part of the stroke. By the action of a latch the main cut-off valves are locked open, and thus prevented from closing the ports until the proper time arrives. By the action of a cam and pin the cut-off valves are disconnected simultaneously and allowed to move in the same or in opposite directions, as occasion may require.

Claim.—First, the spiral cam J, applied in combination with the governor and with the main valve C, and cut-off valve D, substantially as and for the purpose set forth.

Second, the sliding pin *g* and hinged latch *e*, in combination with the valves C D and cam J, constructed and operating substantially as and for the purpose described.

No. 46,021.—GEORGE R. PERCY, New York, N. Y.—*Composition for Rendering Barrels Impervious to Oil, &c.*—January 24, 1865.—This invention consists of a composition made by dissolving one pound of borax in three gallons of water, over a fire, to which are added five pounds of shellac. When this is dissolved, either glycerine, molasses or honey is added, or glue previously dissolved in water. The pores of the wood, of which the barrels are made, are completely saturated with a soluble silicate, after which this composition is applied.

Claim.—Invention for coating barrels and other vessels to contain oils and fats: is a composition composed of water, borax and shellac, in about the proportions specified, with the addition of a small quantity of glycerine, molasses, honey or glue.

Also, the process of the previous saturation of the wood with soluble silicate, in combination with the coating of the barrel or vessel with the above-described composition.

No. 46,022.—GEORGE R. PERCY, New York, N. Y.—*Compound of Condensed Milk and Uncrystallized Sugar*.—January 24, 1865.—This invention consists in combining with the ordinary condensed milk, glucose or other uncrystallizable sugar, the object being the better to preserve the milk, and get also a better tasted article.

Claim.—The commingling of a quantity of uncrystallizable grape sugar with condensed milk, in the manner substantially as above described.

No. 46,023.—REUBEN H. PLASS, New York, N. Y.—*Revolving Fire-arm*.—January 24, 1865.—The cylinder of the revolver is encircled at its middle with a trunnion band within which it can freely revolve when in position, and on the trunnions of which it can be turned laterally within the frame, so as to explode the chambers. The cylinder is also provided with a hinged breech-piece.

Claim.—First, the trunnion ring C c, adapted to embrace the revolving part, and to allow it to be turned about on the trunnions, substantially in the manner and for the purpose herein set forth.

Second, the hinged cap or rear piece G g, arranged and operated substantially as herein represented and described.

Third, in combination with means for revolving the chambered part B on an axis transverse to the line of the barrel, making the face or front end of the chambered part B portion of a sphere, having its centre at the point where said transverse axis crosses the longitudinal axis, and giving a corresponding concave form to the adjacent fixed parts, all substantially as and for the purpose herein set forth.

Fourth, the convex projection G² on the rear face of the cap G, and the corresponding form of the recesses in the stationary part A, to serve in combination with the rotating part B, and perform the double function of a stop and an abutment for the recoil, all substantially as herein set forth.

No. 46,024.—PETER PRESCOTT, Booneville, N. Y.—January 24, 1865.—*Composition for Varnish, &c.*—This invention consists of a composition of water, borax, shellac, isinglass and white vitriol. The water is mixed with shellac and brought to a boiling heat, when the borax is added. When all is dissolved, the isinglass dissolved in as little water as possible is added, and while cooling the white vitriol is added.

Claim.—A composition for varnishing, painting, &c., made of the ingredients herein specified, and mixed together substantially in the manner and about in the proportion set forth.

No. 46,025.—EDMUND D. REYNOLDS and O. BRADFORD REYNOLDS, North Bridgewater, Mass.—*Combined Cultivator and Harrow.*—January 24, 1865.—This invention consists in the combination of a series of cultivator teeth or shares, with a series of rotary harrow teeth placed in the rear of the shares, and driven by the wheel or wheels of the carriage; the series of cultivator shares and the cylinder of rotary teeth being hinged respectively to the frame or carriage, so that they rest loosely upon the surface of the ground while operating, their extent of penetration being determined by their capability of movement below the plane of the draught and guide wheels of the carriage, and the movement of the carriage.

Claim.—The combination of the cultivator shares h and rotary harrow teeth m, when so arranged with respect to a carriage a that they are self-adjusting in their action upon the soil being cultivated, substantially as set forth.

No. 46,026.—GEORGE S. ROGERS, Thetford Centre, Vt.—*Machine for Drying Paper.*—January 24, 1865.—The claim, in connection with the engraving, explains the nature of this invention.

Claim.—The said improved paper-drying machine constructed with one or more drying cylinders A B, two endless aprons R S, and sundry guide rollers and planes, arranged in manner and so as to operate substantially as described.

No. 46,027.—SEYMOUR ROGERS, Pittsburg, Penn.—*Hay Elevator.*—January 24, 1865.—This invention consists in a device for elevating hay in barns, the implement, with its load, being raised by a horse. It is more simple in construction than the ordinary hay elevator, and may be manipulated with greater facility.

Claim.—As an improvement in hay elevators, the rod D, provided with the jointed arms F F, in connection with the pointed case A, all arranged to operate in the manner substantially as and for the purpose set forth.

Also, the notches e f in the rod D, in connection with the spring G and the hole a in the cap c, and the eccentric H, all arranged substantially as and for the purpose specified.

No. 46,028.—FRANCIS G. SANBORN, Boston, Mass.—*Button-hole Cutter.*—January 24, 1865.—The cutting blade is on the interior of the upper handle of the scissors, between the hand of the operator and the pivot. The cutting-block or anvil is held opposite, in a dovetail-shaped frame. This frame is held to its place by a spring outside or underneath the handle, bearing against the handle and against a ring or belt attached to the dovetail-shaped frame.

Claim.—First, a cutting-bed for cutters and punches to be applied to the shanks of scissors, secured and held adjustably on the shank by means of spring pressure, substantially as described.

Second, the use of the dovetailed or grooved frame of the cutting bed B, for holding movable blocks of horn, vulcanized or hard rubber, or gutta-percha, wood, or other substance, for a cutting surface, as above set forth, when the same is applied to the shanks of scissors, substantially as above described.

No. 46,029.—JOHN C. SANTEE, Hughesville, Penn.—*Bedstead Fastening.*—January 24, 1865.—This invention consists in a method of attaching the several parts of a bedstead by means of lugs, ribs, plug grooves, and flanges, dispensing with mortises, thus rendering all parts accessible for cleaning.

Claim.—First, the lugs C and E, constructed and applied substantially as herein shown and described, to secure the parts of the bedstead together without mortises.

Second, in combination with the above the ribs R R', for affording an additional support to the rails.

Third, the combination of the plugs K and flanges e', for securing the lugs e within the posts, substantially as and for the purposes herein set forth.

No. 46,030.—GEORGE ESCOL SELLERS, Sellers's Landing, Ill.—*Paper Washer for Paper Stock.*—January 24, 1865.—About a central shaft is placed an inverted conical wire-gauze drainer, and within it a similar shaped perforated water vessel, a space being left between the two. The latter cone has a central tube through which the pulp is supplied to the bottom of the drainer, whilst it is itself constantly supplied by a stream of clean water, and has also at its bottom fans to act upon the diluted pulp. The drainer and the water vessel are both caused to revolve with great velocity; the action of the fans is such as to drive the pulp by centrifugal force upwards and outwards against the drainer, and thus increase its area as it rises on an increasing diameter, and so spread the pulp thinner and thinner, until it reaches the top, where it is discharged. While thus rising, the water is distributed with great force through the perforations of the water vessel into the pulp, and forced through it and out through the meshes of the wire drainer, carrying with it large portions of non-fibrous matter.

Claim.—Washing pulp or fibre for paper stock by submitting it to the action of a centrifugal drainer, so arranged as to permit the stuff to pass over the draining surface in a gradually thinning sheet, and to be washed by a continuous stream of water passing through it, substantially in the manner and for the purpose specified.

No. 46,031.—GEORGE ESCOL SELLERS, Sellers's Landing, Ill.—*Cane Stripper.*—January 24, 1865.—This invention consists in a cylinder filled with projecting blades or teeth. The cane is introduced between two feed rollers, and the leaves or branches are snapped off by means of the rapid motion of the teeth, as the cane is drawn through and delivered upon a table outside of the machine, while the leaves are carried under the machine.

Claim.—First, the stripping or breaking of the branches from the stems of cane or reeds, or stripping off the leaves only by blows struck by revolving arms, slats, or blades, the cane or reeds being so fed as to insure contact with the part to be struck off, substantially as specified.

Second, receiving the stripped cane upon an inclined table arranged with a stop to facilitate bundling, substantially as specified.

No. 46,032.—A. G. SHAVER, New Haven, Conn.—*Eraser.*—January 24, 1865.—This invention consists in forming an eraser with a file-cut surface, in combination with a cutting or scraping edge, and also providing the same with a convex burnishing surface.

Claim.—First, an eraser constructed with a file-cut surface, in combination with a sharp-cutting or scraping edge or edges, substantially as shown.

Second, an eraser constructed with a file-cut surface, in combination with a sharp-cutting or scraping edge or edges, and a convex burnishing surface, substantially as shown and described.

No. 46,033.—LYMAN SMITH, Erie, Penn.—*Apparatus for Extracting Oils, &c.*—January 24, 1865.—This invention consists of a trough with a perforated bottom, directly under which is a second trough. From the bottom of the latter trough a tube provided with a stopcock extends vertically downwards, and terminates in a tank. The material to be operated upon is placed in a tank A, and the lower trough and tube E are filled with water. On opening the stopcock a vacuum is formed in the trough, and the pressure of the atmosphere forces the oil or other liquid out of the material.

Claim.—The tank A with perforated bottom B and tank C, in combination with the tube E and receiving tank F, constructed and operating substantially as and for the purpose set forth.

No. 46,034.—HENRY C. SPAULDING, Brooklyn, N. Y.—*Metallic Cartridges.*—January 24, 1865.—To prevent galvanic or chemical action between the metallic shell and ball, to the prejudice of the powder, the shell, particularly, is coated on its inside with collodion, as a non-conductor, and the strength of the charge thus preserved.

Claim.—A metallic cartridge coated on its interior with a non-conducting coating, substantially as set forth.

No. 46,035.—D. C. STONE, Kingston, N. Y.—*Millstone Pick.*—January 24, 1865.—This invention relates to that class of steam pumps which are constructed of thin steel plates, and are fitted in metallic heads secured to a handle, provided with openings in said heads extending entirely through it longitudinally, and having a rack at one side, in combination with a key and a lip on the inner end of the pick blade.

Claim.—The head B, provided with an opening a extending entirely through it longitudinally, and having a rack c at one side, in combination with the key E and the lip d on the inner end of the pick blade, substantially as and for the purpose set forth.

No. 46,036.—LEVI W. TURRELL, Newburg, N. Y.—*Steam Pump*.—January 24, 1865.—This invention consists in arranging both the induction and eduction valves of the pumps upon a horizontal plate, and guiding them by means of sockets projecting downwards from such plate; also in the manner of arranging the chamber of such valves, by which they are made more accessible for repairs, or removing any obstructions that may happen to lodge therein.

Claim.—First, the combination of the valves $D^1 D^2 S^1 S^2$, seated upon a common plate M and guided by sockets $d' s''$ projecting downward from the cap plates, all as herein described, to facilitate the inspection and removal and replacement of the valves.

Second, in combination with the above, disposing the several chambers of the valve chest in such a way that the movement of the piston of the pump cylinder will alternately open two of the valves and close two, in the manner and for the purpose explained.

No. 46,037.—J. S. UNDERHILL, New York, N. Y.—*Vessel of War*.—January 24, 1865.—This invention consists in the use of armor plates, or plated annular turrets, arranged horizontally or nearly so, with their edges secured by bolts which pass through the plates vertically or nearly so.

Claim.—The combination of the horizontal plates $a a$, vertical bolt $b b'$, vertical plates $d d$, and screws $e e$, all constructed, applied, and secured in the manner and for the purposes herein specified.

No. 46,038.—CHARLES M. WETHERILL, Lafayette, Ind.—*Method of Inking Stamps*.—January 24, 1865.—This invention consists in the use of an elastic buffer composed of glue, molasses, and glycerine, with or without insoluble powders, upon which the ink is spread evenly by means of an elastic or firm roller, the ink being afterwards transferred to the stamp by pressure.

Claim.—The use of an elastic buffer composed of glue and molasses or glycerine, or their equivalents, with or without admixture of insoluble powders, upon which coloring matters are spread with an elastic or firm roller or by other known means, and from which the aforesaid coloring matters may be taken by the pressure of a stamp thereupon and transferred to the object to be stamped.

No. 46,039.—B. C. WHITE, Richmond, Ind.—*Fanning Mill*.—January 24, 1865.—In this invention the hopper has a hinged adjustable radially slatted or ribbed feed-board. From the rock shaft with the pitmen and connections a rotary combined with a lateral and vertical motion is given to the shoe. A loose screen receives all these motions, and an additional independent jarring motion; the height of the shoe adjustable by means of links and turning hooks. A slide running in grooves has adjustable wind boards.

Claim.—In combination with the feeding hopper, the hinged adjustable and radially slatted or ribbed feed board k , operating as and for the purpose substantially as set forth.

Also, the combination of the rock shaft d and its crank arms and the crank wheel f , with their several connections, to the first moving power and to the shoe, for the purpose of giving the shoe an end and side or a longitudinal and lateral motion, substantially as and for the purpose described.

Also, in combination with the shoe, the loose screen H , having a shake or jarring motion at its rear lower end, independent of but in addition to the motion it has with the shoe, substantially as described.

Also, in combination with the shoe, the adjustable wind board frame or slides, and the adjustable wind boards therein, as and for the purpose described.

Also, the hanging of the shoe by means of the wire links and turning hooks, by which it may be raised or lowered to adapt it to the blast or the character of the grain being cleaned, substantially as herein described.

No. 46,040.—WARREN WILDER, Wilkinsonville, Mass.—*Shuttle for Looms*.—January 24, 1865.—The springs, both on the same side of the spindle, are so arranged that one exerts an independent pressure on the spindle-head to keep the spindle in position, while the other exerts an independent pressure on the head of the bobbin to retain it on the spindle; both are acted on simultaneously when the spindle is raised, and the bobbin is, by the act of raising, disengaged from its spring.

Claim.—The combination and arrangement of the springs $d g$, when attached to the spindle-shank b , with cross-pins m for operating the same, substantially as herein described.

No. 46,041.—S. W. WOOD, Cornwall, N. Y.—*Process for Making Cast Steel*.—January 24, 1865.—This invention consists in treating pig iron in a puddling furnace in the same manner as for making wrought iron, until it takes the form of fine granular particles; it is then taken out of the furnace and allowed to cool, and is stamped and separated from the cinder by any suitable means. The decarbonized iron thus obtained is melted in a crucible with a sufficient amount of charcoal to produce steel of the desired quality.

Claim.—Making cast steel by melting decarbonized iron, prepared substantially as herein described, in connection or contact with charcoal, or other form of carbon, either with or without the use of black oxide, manganese, or flux, substantially as specified.

No. 46,042.—T. C. WOOD, Augusta, Mich.—*Extension Ladder*.—January 24, 1865.—This invention consists in constructing a ladder of two parts, connected by a hinge, and arranged in such a manner that the ladder may be compactly folded for transportation, or when not required for use, or be adjusted so as to serve as a short ladder, similar to an ordinary step-ladder, and also be capable of being adjusted as a long ladder, the two parts being in line with each other. With this folding ladder there can be used a removable and adjustable platform, applied in such a manner that it may be readily removed from the ladder and applied to it and adjusted as circumstances may require, to serve as a convenient stand in packing fruit.

Claim.—The folding ladder, composed of the two parts A B, connected together as shown, in combination with the removable and adjustable platform D, all arranged substantially as and for the purpose herein set forth.

No. 46,043.—J. P. WOODBURY, Boston, Mass.—*Street Steam Railway Cars*.—January 24, 1865.—This invention consists in certain improvements in the construction of what are known as dummy engines, or street steam railway cars, whereby they are enabled to run with ease and freedom around the shortest curves that ever occur in any streets or railway tracks.

Claim.—First, the combination of the boiler and engine of a locomotive with a car truck provided with a circular truck frame and anti-friction rollers, so adjusted as to be received within one end of a car, so that the truck can turn independently of the car, in the manner and for the purpose herein set forth.

Second, the combination of one end of a railway car with an independent circular locomotive car truck, when constructed in the manner and for the purpose herein described.

Third, constructing the truck I with a circular track *i*, provided with anti-friction rollers *h*, to support the forward portion of the car, and allow the truck to turn with freedom under it, substantially as described.

Fourth, the independent circular carriage of radial anti-friction rollers, to operate in combination with the top of the truck and the bottom of a railway car, substantially as described.

Fifth, connecting the car to the centre pin of the truck frame at the bottom by means of the connecting bar V, substantially as described.

Sixth, the employment of a centre pin and connecting bar to connect the top of the car with the top of the engine and boiler truck, substantially as shown in Fig. 9.

Seventh, forming the front of the passenger car concave, and the engine and boiler room convex and circular, so that the one may turn in the other, substantially as represented in Figs. 7, 8, 9, and 10.

Eighth, making the rear truck to turn on a centre pin in the rear end of the car body, in combination with the circular tracks and carriage of radial anti-friction rollers which support the car body on the truck, substantially as described.

Ninth, the anti-friction wheels *m*, to operate in combination with the revolving engine room and passenger car, substantially as described.

Tenth, so constructing and arranging the smoke and exhaust pipe as to pass through the top of the car, directly over the centre pin U, wherever the boiler is placed, so that when the truck frame turns on a curve, said pipe may also turn with freedom through the car top, substantially as described.

No. 46,044.—ELIJAH YOUNG, Tuscarora, N. Y.—*Grain Separator*.—January 24, 1865.—This invention consists in joining to the shute-board, by hinges, an upper screen, adjustable vertically at its rear end, and combining with this a longitudinally adjustable discharge screen.

Claim.—First, so constructing and arranging the sieve F that it may be elevated at its rear end sufficiently to prevent any grain from passing over that end, substantially as and for the purpose set forth.

Second, connecting the sieve E to the shute-board by means of hinges, as set forth and described.

Third, in combination with the vertically adjustable sieve E, as described, the longitudinally adjustable discharging screen C, as and for the purpose set forth.

No. 46,045.—JOSHUA E. AMBROSE, Middletown, N. Y., assignor to SARAH T. AMBROSE, Passaic, N. J.—*Coal Oil Lamp and Gas Stove*.—January 24, 1865.—This invention consists of a square sheet-iron stove, to be used with a kerosene lamp, or a gas burner, having on each side an oven for baking, &c., which is surrounded on all sides, except the outside and ends, by a flue, in which the products of combustion circulate. On the top of the stove are holes in which the cooking utensils are placed, and a pan for baking may also be placed thereon. By means of dampers the products of combustion may be prevented from circulating beneath the top, and made to pass directly out of the chimney. On one end of the stove is a boiler in which to generate steam, which is conveyed off by pipes to perform various culinary operations. Pieces of mica are let into the stove in various places to expose the light and also to give a view of the interior of the ovens.

Claim.—First, the use or employment of mica in the sides, bottom, and top of the ovens, for the purpose specified.

Second, in combination with the stove, constructed as described, the use or employment of the reservoir J and tubing K, for the purpose specified.

Third, the flue B, constructed as shown, for the purpose specified.

Fourth, the use or employment of the dampers E in combination with the flue B, for the purposes set forth.

Fifth, combining with a stove, provided with the side ovens C, the flue B, for the purpose specified.

No. 46,046.—GEORGE N. BOLLES, assignor to S. W. WALKER & Co., Kalamazoo, Mich.—*Wringing Machine.*—January 24, 1865.—This invention is explained by the claims and engraving.

Claim.—First, the two frames A A', provided with rollers C C, and connected together by the joints B B as shown, in connection with the elastic bar E, spring F, and set screw G, all arranged substantially as and for the purpose specified.

Second, the gearing c c d d, in combination with the two frames A A' and rollers C C, substantially as and for the purpose set forth.

No. 46,047.—D. B. CLEMENTS, assignor to himself and D. H. NASH, Brooklyn, N. Y.—*Horse Hay-fork.*—January 24, 1865.—This invention consists in the arrangement of a link which connects the elevating fork with the hoisting mechanism, and is provided with a latch, by which it is held in position, in connection with a metallic stock or handle. A tooth is fitted to swing over the tines so as to hold the hay in place upon the tines.

Claim.—First, the arrangement of the link c connecting the hay-elevating fork with the hoisting mechanism, and provided with the latch 2, in combination with the metallic stock or handle, as specified.

Second, the tooth i, fitted to swing over the tines for holding the hay in its place on said tines, as specified.

No. 46,048.—LEMUEL S. FITHIAN, Absecum, N. J., assignor to himself and JOHN YOUNG, Joliet, Ill.—*Machine for Pulverizing the Soil.*—January 24, 1865.—This invention consists in making the cutting blades in sections, which are placed obliquely to the line of the shaft, and are so arranged that the edges of the blades are further from the shaft than the back, which prevents the friction from the uncut earth as the machine is rotated and moved forward.

Claim.—First, constructing the rotary pulverizer in sections, the cutters M of which coincide with frustums of a cone or cones, substantially as and for the purpose specified.

Second, giving the cutters M a raking position, and also an oblique position on the heads L', substantially as and for the purpose set forth.

No. 46,049.—LEVY J. HENRY, assignor to JOSEPH BEURIME, San Francisco, Cal.—*Mode of Protecting the Surfaces of Wooden Piles.*—January 24, 1865.—This invention consists in applying to the surface of a wooden pile a coating of asphaltum, or similar material, and, while said asphaltum is still hot, sprinkling upon it sand, gravel, or earth, and then applying another coating of asphaltum, and so on until the whole is sufficiently coated. The pile may be also covered with a coating of felt, or other material, upon which the alternate layers of asphalt and sand may be applied.

Claim.—The use of alternate layers of asphaltum and sand or earth, applied to piles and other articles exposed to the action of marine insects or worms, for the purposes specified.

Also, coating or protecting piles and other articles from the action of salt water by means of asphalt applied upon sheets of felt or other material attached to said articles, in the manner and for the purposes specified.

No. 46,050.—ENOS T. HIGHAM, assignor to himself and D. HIGHAM, Philadelphia, Penn.—*Window Shade Adjuster.*—January 24, 1865.—This invention consists of a grooved screw, a nut being adapted to the same, a sliding bar, and a knob for receiving the cord of the window shade; the whole being arranged so that the cord may be under the control of the screw and nut.

Claim.—The grooved screw A and h, bar e, and the knob f, or its equivalent, the whole being arranged and operating as and for the purpose herein set forth.

No. 46,051.—P. C. INGERSOLL, assignor to himself and HORACE F. DOUGHERTY, Greenpoint, N. Y.—*Press.*—January 24, 1865.—The object of this invention is to facilitate the introduction of the material to be pressed into the top of the press-box, which has a follower that is operated by a screw; also to prevent the canting of the follower in the act of pressing from injuring the screw which is employed to operate said follower, and at the same time provide for elevating the follower after the pressing operation in a horizontal plane or in such manner that it shall bind or wedge itself against the sides of the press-box.

Claim.—First, elevating and depressing the follower by means of a screw shaft having its lower end fitted loosely to the follower, combined with suspension rods g g, substantially as described.

Second, the combination of the loosely-fitting yoke K, screw shaft F, and suspension rods *g g*, with a follower, substantially as described.

Third, providing for opening the upper end of the press-box by the employment of a laterally sliding follower, applied and operating substantially as described.

Fourth, the laterally sliding screw support or bridge beam E E', in combination with the follower G G' and supporting bars *a a*, substantially as described.

Fifth, the friction rollers *b b*, and bridge beams E E', in combination with the holding down beams *a a*, substantially as described.

Sixth, the stops *i i* or their equivalents, in combination with the laterally adjustable bridge beams E E', substantially as described.

No. 46,052.—PETER W. KINISKEN, assignor to himself and JARED G. SCOTT, Monee, Ill.—*Field Fence*.—January 24, 1865.—In this invention the adjoining ends of the boards are notched and secured, so that they will fit and lock together in two positions, forming at will a straight or worm fence.

Claim.—A portable fence, with the adjoining ends of the boards recessed and notched in the particular manner herein shown and described, so that they will fit and lock together in either position, to produce at will a straight or a worm fence as specified.

No. 46,053.—ELIAKIM MARS, assignor to himself and AUGUSTUS MARSH, Newark, N. J.—*Lamp*.—January 24, 1865.—This invention consists in the mode of attaching the deflector, button, and wick tube, so as to hold the respective parts firmly in place.

Claim.—Attaching together the deflectors *b* and the button *f* in the manner herein above specified.

No. 46,054.—CHARLES E. SNIDER, assignor to himself and THOMAS POULTNEY, Baltimore, Md.—*Method of Converting Muzzle into Breech loading Fire-arms*.—January 24, 1865.—This invention is intended to convert easily single or double barrelled muzzle-loading arms into breech loaders, and consists in providing means for tilting and locking the barrels, through a lug-bar screwed to the barrel or barrels and the lever trigger guard.

Claim.—First, the lug-bar C attached to the barrel by screws *c c c*, and provided with projections D D' for the pivoting of the bar E, and lever L, to the barrel, in the manner and for the purposes set forth.

Second, the pivoted bar E, constructed and employed as described, for the attachment of the breech G of a double or single barrelled gun for converting the same to a breech loader, the said bar being provided with a projection E' at its rear end, and an abutment E², fitting the inclined back of the projection I on the lug-bar C, so as to constitute, in combination with the said lug-bar, a rigid connection between the breech and barrel, while in position for firing, as explained.

No. 46,055.—JAMES WARD, assignor to himself and GARRETT A. LANS, Boston, Mass.—*Brick Machine*.—January 24, 1865.—This invention consists in a revolving mould carriage, provided with moulds and plungers to co-operate with a pair of pulverizing or preparing rollers, arranged within a box, the whole combined and arranged with adjustable scrapers, an auxiliary roller, an annular rail, a series of friction rollers, and lifters with their cams.

Claim.—The combination and arrangement of the two adjustable scrapers K L, with the preparing rollers G H, the case E, and the mould carriage A.

Also, the combination of the auxiliary roller I, its chamber N, and its adjustable scraper M, with the mould carriage A, the rollers G H, the case E, and the scrapers K L, arranged together and within the case E, substantially as specified.

Also, the arrangement of the mould wheel A, the case E, the shaft *h*, the roller I, the chamber N, and the mechanism for operating the rollers G H, and the mould carriage A.

Also, the combination and arrangement of the annular rail *d*, and the series of friction rollers *e*, with the mould carriage and the series of plungers thereof.

Also, the combination and arrangement of the series of lifters *c* and their cams B C D with the rotary mould carriage A, the rail *d*, and the series of friction wheels *c*.

No. 46,056.—E. R. HOLLANDS, Northampton Square, England.—*Machine for Punching Metal*.—January 24, 1865.—In this apparatus the punch is forced down upon the metal by the joint action of two friction rollers, which are forced between an inclined plane formed on the upper end of the punch, and another inclined, though stationary, plane formed in the framework of the machine, and a wedge-shaped bar, which is forced endwise between the two rollers. The movements of the rollers and wedge are simultaneous, though with different velocities, and are effected by screw-threads of varying pitch, cut on different portions of the shank of the wedge-bar.

Claim.—The combination of the tool holder with the movable wedge, the mechanism for moving it, the rollers and the inclines, or their equivalents, operating substantially as hereinbefore set forth.

No. 46,057.—JULES O. METHIEU, Paris, France.—*Machine for Making Cords, Ropes, &c.* Patented in France February 12, 1863.—The object of this invention is to spin and wind yarns, cords, or ropes of any size, and to lay the strands with any required strain or tension.

Claim.—The arrangement of the flyer and bobbins or spools with their described intermediary connecting and operating parts, when constructed, arranged, and operating as and for the purpose herein described and represented.

No. 46,058.—EDWARD PAYNE, London, England.—*Apparatus for Measuring and Testing Spirits and other Distillates.*—January 24, 1865.—This invention consists of a frame containing the tanks, which are placed on a vibrating yoke. The distilled spirit passes first into one of the tanks, and when it has filled the said tank causes it to overbalance the empty one, when it is in turn filled, the first one being emptied automatically at the same time. The tanks are thus filled and emptied alternately; the number of times each is filled and emptied being recorded upon the dials by means of suitable mechanism. As the spirit passes through the tunnel into the tank a small quantity is retained in the sampling device, and caused to flow into the receivers. The sampling device consists of a tube, provided with valves, supported by a suitable mechanism, the valves being so arranged that at each oscillation of the tanks they will allow the sample contained in the tube to pass into the chamber and from thence into the receiver.

Claim.—In connection with a still or distillery, the combined use in one instrument of a measuring and of a sampling apparatus, substantially as herein described, whereby small quantities of the spirit that passes over or through the apparatus are retained for an after test of its proof, and beyond the reach of the operator, while the measured bulk or quantity passes through to any common receiver.

No. 46,059.—G. A. TREMESCHINI, Vicenza, Austria.—*Lamp.*—January 24, 1865.—This invention consists in the combination and arrangement of the copper cone and interior deflector in such a manner in relation to each other and to the outer disk, as to admit the air and highly heat it before it reaches the flame; also in the combination of three or more wicks with and within a movable tube, moving within an outer stationary tube, leaving an intervening air space; also in the mode of fitting the burner to the reservoir, and of filling the latter with oil.

Claim.—First, the arrangement of the copper cone A, and deflector T₂, in relation to each other and to the disk Q, and its air openings T, for the purpose of admitting air from below the disk, deflecting it against the copper cone to be highly heated, and thence carried to supply combustion at the slot, at its upper end, as described.

Also, the arranging of the wicks *b f g* within a tube E, that is movable within an outer stationary tube B, and an intervening air space between them, as and for the purpose described.

Also, securing the heads of the lamp to the bowl by means of a conical shank on the former, and a conical socket on the latter, the two making a tight metallic ground joint, substantially as described.

Also, filling the lamp through an opening in the side of the neck thereof, by means of an instrument substantially such as described, that will flow off the excess of burning fluid beyond a given height, as described and represented.

X No. 46,060.—HENRY LOEWENBERG, New York, N. Y., assignor to himself and EMILE GRANIER, Paris, France.—*Composition for Lining Barrels for holding Petroleum.*—January 31, 1865; antedated December 10, 1864.—This invention consists of a composition of glue, acetic acid, glycerine, and nut-gall.

Claim.—A substitute for India-rubber or composition, made of the ingredients herein specified, and mixed together in about the proportion and substantially in the manner set forth.

No. 46,061.—WILLIAM ADAMSON, Philadelphia, Penn.—*Mode of Economizing the Manufacture of Articles of Leather.*—January 31, 1865; antedated December 29, 1864.—This invention consists in cutting from raw or untanned hides or skins, or parts of the same, pieces of about the size and form required for useful articles of tanned leather, and tanning the said pieces after they have been cut from the raw or untanned hides. It also consists in economizing the manufacture of the sole and heel pieces, and other useful articles of leather, by a saving of time, labor, and material in tanning, and by retaining the remnants, after cutting the articles from the skin, in a condition which renders them marketable.

Claim.—Cutting from raw or untanned hides or skins, or parts of the same, pieces of the size or about the size and form required for useful articles of tanned leather, and tanning the said pieces after they have been thus cut from the raw or untanned hides, as and for the purpose herein set forth.

No. 46,062.—LOUIS PAUL ANGENARD, New York, N. Y.—*Process for Making Looking-glass.*—January 31, 1865.—This invention consists in applying bichloride of platinum, dissolved in alcohol, to the glass with a brush; after which, the glass is placed in a muffle or

oven and baked until it becomes a cherry color. It is then allowed to cool before coming in contact with the atmosphere.

Claim.—The chemical proportions and preparation of the solution and its application to plate glass and other kinds of glass.

No. 46,063.—ELLIS S. ARCHER, New York, N. Y.—*Manufacture of Argand Burners.*—January 31, 1865.—The tip or perforated ring, as heretofore made, is dispensed with by this method of manufacture; one part of the burner being spun or stamped from sheet-brass so as to fit the casting, and the other part being turned to a gauge so as to fit exactly inside the first: the edge of the first is then spun tightly over the edge of the second.

Claim.—The making of an argand burner in the manner described, thus dispensing with the tip or perforated ring, as heretofore made.

No. 46,064.—JOSEPH W. BARTLET, New York, N. Y.—*Sewing Machines.*—January 31, 1865.—In this machine the rocking looper shaft receives its backward sliding motion from an adjustable cam on its rear end, whence it is returned by a spring. The adjustable sleeve on this shaft, with its projection, operates and varies the feed. There is also provision for an upper feed, by means of the presser foot and its connections.

Claim.—First, the combined sliding and rocking movement of the looper or under needle rod or shaft *i*, when arranged and actuated substantially as set forth.

Second, the adjustable sleeve or lever *o*, when constructed and operated as and for the purposes set forth.

Third, the sliding or rocking looper or under needle rod or shaft *i*, the adjustable sleeve or lever *o*, the cam or lever *u*, and pin or projection *z*, when combined substantially as set forth.

Fourth, the sliding or rocking looper or under needle rod or shaft *i*, the cam or lever *u*, pin or projection *z*, and feed bar *s*, when combined substantially as set forth.

Fifth, the presser foot *e*, cam *z*, (as shown and described in Fig. 7, sheet 2,) and sliding and rocking rod or shaft *i*, when combined substantially as set forth.

No. 46,065.—SAMUEL BAXENDALE, South Malden, Mass.—*Machine for Surface Sizing Wadding, &c.*—January 31, 1865.—In this machine the upper reticulated metallic apron is so situated as to exert a pressure upon the sized bat as it passes over the cylinder for the purpose of producing the adhesion of the fibres by means of the sizing. The blast pipe is for the purpose of detaching the bat from the apron. The other features are sufficiently explained by the claim.

Claim.—First, the combination of the rotary cylinder *F*, having pin points or other rigid projections on its periphery, with the rotary brush *D*, or its equivalent, from which the pins or projections of the said cylinder receive the sizing to sprinkle it upon the bat or web by centrifugal force, substantially as herein specified.

Second, the deflector *I*, in combination with the cylinder *F*, substantially as and for the purpose herein described.

Third, the reticulated or perforated metallic endless aprons *E E'*, in combination with a device for sprinkling the sizing upon the bat or web, substantially as and for the purpose herein set forth.

Fourth, the employment, in combination with two perforated or reticulated endless metallic aprons *E E'*, operating together as herein described, of a blast pipe *M*, or other equivalent device, for delivering a blast of air applied within one of said aprons, substantially as and for the purpose herein set forth.

No. 46,066.—THEODORE BERGNER, Philadelphia, Penn.—*Instrument for Cutting Photographs.*—January 31, 1865.—This invention consists of a die-punch, worked by a lever from below two metal plates, perforated in the form required for the photograph, the photograph being placed between the plates with the face upwards.

Claim.—The described instrument for cutting out photographs, with its punch *A*, die *B*, and guide plate *C*, operated as set forth, and are relatively so arranged as to facilitate accurate adjustment of the picture to be cut out, substantially as specified.

Also, in combination with the described instrument, the use of gauges *b* and *o*, substantially as and for the purpose specified.

No. 46,067.—ALPHEUS P. BLAKE, Milton, Mass.—*Centrifugal Ventilator.*—January 31, 1865.—This invention consists of a revolving ventilator for chimney tops, revolving on an axis, set at one end in an iron rod, bent over the apparatus, and fastened at the ends to the chimney, and another in a step in a frame in the chimney. In the upper part of the ventilator are V-shaped rings, attached to the top and second plates, which, being acted on by the wind, cause the ventilator to revolve. The top and second plates are closed. The edge of the second extends beyond the circle in which the wings are placed, and from this point incline towards the chimney at a small angle. Under this plate is a third, nearly parallel with an orifice in the centre, of corresponding size, with an exit pipe. The smoke passes out through the exit pipe and the said orifice and between the two plates. There are several

vertical partitions between the plates, extending from the outer edges of the plates to the edge of the orifice in the lower plate.

Claim.—First, the arrangement of the fans or blowers of the exhaust wheel.

Second, encasing the fans or blowers at the top and bottom.

Third, the combination and arrangement of the fans, disk, and wheel, as shown in section No. 2, all of which substantially as described and for the purpose set forth.

No. 46,068.—ISAAC W. BOWERS, Ovid Centre, Mich.—*Stave Machines*.—January 31, 1865.—The object of this invention is to slice and at the same time saw the staves to the exact length, and consists in a machine for slicing staves from a block, by attaching two adjustable circular saws, which, as soon as the stave is sliced off, the saws will cut to the desired length, it being held in place by two circular springs until the next succeeding stave is cut.

Claim.—The combination of the saws H H and springs M M, applied to a stave-cutting machine, to operate in the manner substantially as and for the purpose herein set forth.

No. 46,069.—BARCLAY BROWN, Byberry, Penn.—*Apparatus for Evaporating Saccharine Liquids*.—January 31, 1865.—This invention consists in so arranging the sectional grates, on wheels or on endless bands, that each section can be readily withdrawn from the furnace without removing the other grates, and also in placing the sections on hooks, so that they may be raised or lowered, and thus be made to approach or recede from the evaporating pan, the hooks being operated by means of levers and rods.

Claim.—First, a grate made in sections, which can be moved both in a horizontal and in a vertical direction, substantially as and for the purpose described.

Second, the hook frames D D D' and levers E E E", arranged with sectional grates C C C" and handles F F F", or their equivalents, in the manner and for the purpose substantially as set forth.

No. 46,070.—WILLIAM E. BROWN, Boston, Mass.—*Portable Separating Coal Sifter*.—January 31, 1865.—This device is composed of three sieves, arranged one above the other, and all inclined sufficiently to insure the charge rolling down from them. The upper and lower sieves incline the same way, and the ashes or other fine substance that pass through them fall directly into a receptacle beneath. The middle sieve is inclined in a direction opposite to that of the other two, and the charge falls upon the lower sieve and from thence into another receptacle. Under the middle sieve is a close shelf, which prevents the ashes from falling directly down. This shelf has the form of a double incline, so that the ashes are turned aside and conducted into the ashes receptacle.

Claim.—The combination with a series of inclined sieves or screens of one or more deflectors, composed of inclined surfaces, throwing the ashes out of the path of the sifted coal into the ash-box, substantially as herein described.

No. 46,071.—GEORGE R. BURDON, Waltham, Mass.—*Adhesive Fastening for Papers*.—January 31, 1865.—This invention consists in providing pieces of leather or cloth coated on one side with masticage, and cut in such a form as to interlock when two are placed opposite to each other on loose sheets of paper, where they may be permanently fastened by an ordinary pin.

Claim.—Locking or joining together loose sheets or pieces of paper by means of a hinged binding, composed of pieces of leather or cloth, united by means of a pin, or locked into each other, as set forth.

No. 46,072.—WILLIAM BURNET, Providence, R. I.—*Newspaper File*.—January 31, 1865.—This invention consists of a rod enclosed in the grooved side of a cylinder, where it is held by a spiral spring at one end and a conical plug on the other end.

Claim.—The single rod, with a longitudinal groove or recess to receive the back of the folded sheets—the cord or wire shunting into the groove, and attached at one end to the spiral spring contained in the handle, and the other attached to the conical-shaped knot fitting the counter sink in the top of the rod, all made and operating substantially as set forth, or their mechanical equivalents.

No. 46,073.—JOHN H. BURNS, Clinton Station, N. J.—*Pumps*.—January 31, 1865.—This invention consists of two horizontal cylinders, forming an obtuse angle; in this angle a crank revolves, the shaft of which is stepped below, and ascends vertically to a pinion and gearing. This crank operates two piston rods, one moving in each of the horizontal cylinders, carrying a globular plunger, at its extremity. The water is admitted into the remote end of each of the horizontal cylinders, where there is a valve, and is forced up one of the legs of a siphon-shaped pipe and thence through an eduction pipe, into which both currents enter and form a continuous flow. The pinion above may be operated through appropriate gearing by any desired power.

Claim.—First, the barrels A A, arranged at angles as described, in combination with the vertical crank shaft E and common ascension pipe J, constructed and operated as and for the purpose herein shown and described.

Second, the spherical plungers B in combination with the barrels A A' of the pump, and with the crank shaft E, and operating substantially as and for the purpose set forth.

No. 46,074.—STEPHEN DECATUR CARPENTER, Madison, Wis.—*Construction of Gunboats*.—January 31, 1865.—This invention consists in constructing gunboats and other vessels of war with a flat deck, and with sides which narrow in from the deck downwards to below the water line, and plating the deck and sides with defensive armor.

Claim.—The manner of constructing the portion of gunboats or war vessels exposed to shot, shell, or other projectiles with outward projecting angles for the sides and ends, in combination with the level deck, substantially as herein described and for the purposes set forth in the specification.

No. 46,075.—JONATHAN CARTER, Winchendon, Mass.—*Painting Pails*.—January 31, 1865.—This invention consists of a roller with elastic ornaments on its surface, mounted on a proper handle. The sides of the roller are made to flare in the same degree as the pails to be ornamented, so that by running the tools on a pail the lines of ornament are kept parallel with the edges.

Claim.—The conical die roll, when constructed in the manner and for the purposes substantially as set forth and described.

No. 46,076.—D. H. CHAMBERLAIN, West Roxbury, Mass.—*Hand Stamp for Printing*.—January 31, 1865.—This invention consists in placing a slot in the end of a lever bar, to facilitate the adjustment and removal of changeable dies.

Claim.—Bifurcating the outer end of the lever C so as to admit of the type block E being readily removed and replaced, in the manner substantially as set forth.

No. 46,077.—WILLIAM CHESLEY, Cincinnati, Ohio.—*Valve Cocks*.—January 31, 1865.—In this device the hub screws down within the faucet, and a cap is screwed upon its upper end. The lower part of this hub has a central recess. When the hub is screwed up, so as to be nearly withdrawn, the screw portion of the valve stem is below the female screw of the hub, and the smooth portion of the valve revolves in and is guided by the hub during the process of guiding the valve in its seat.

Claim.—So constructing the boss G and the hub H I as to liberate the valve screw stem for regrinding, by simply screwing back said hub, which thereby becomes a fixed guide for the smooth portion of said stem, substantially as set forth.

No. 46,078.—JAMES A. CLARK, New York, N. Y.—*Machine for Washing Wool*.—January 31, 1865.—In this machine the wool is conveyed into and out of the trough by endless aprons, and passed through the same between two other endless aprons, under one of which is a bed of rollers, and over the upper of which a series of vertical beaters or stampers is arranged, one above each roller. These stampers are successively operated by a revolving shaft having thereon a set of lifters, spirally arranged. An inclined shelf under the rollers carries off the dirt as it is washed from the wool into an adjoining compartment, preventing its falling upon the lower portion of the lower apron. Provision is also made for picking the wool as discharged by means of a revolving cylinder with radially advancing and receding teeth in conjunction with a set of stationary teeth.

Claim.—The combination of the apparatus described, for conveying the wool, &c., through the reservoir, with the apparatus for washing the same, consisting of the stamps, constructed as described, acting on a roller bed or its equivalent, as and for the purposes herein set forth.

No. 46,079.—CHARLES CLEMINSHAW, Troy, N. Y.—*Filters*.—January 31, 1865.—The bottom of a close vessel being perforated, a canvas is extended thereon, by means of a hoop, which packs tightly at the sides. Sand or other suitable medium is poured thereon, and the liquid is then admitted or forced in through a pipe near the top of the vessel.

Claim.—The combination of the packing ring c with the close vessel A, filtering medium B, pipe C, screw b, and perforations a a, arranged and operating as and for the purposes specified.

No. 46,080.—JOHN F. CLEU, New York, N. Y.—*Valve for Submarine Ordnance*.—January 31, 1865.—The plug, which is screwed into the wall of the gun, is composed of three parts, one screwing over and on top of each other. Between these there are two valves, which secure a vacuum in the bore of the gun after the air pump has been applied; other openings, such as muzzle and touch-hole, having been properly secured. A check-valve or rotating gate at the bottom of the plug secures the two upper valves from injury on the explosion of the charge.

Claim.—First, the plug B provided with one or more valves C C' and a cap E, for the purpose of protecting said valves and excluding air from an exhausted cannon.

Second, the check valve C2, employed substantially as described, to protect the aperture b and valves C C' from the expansive pressure of the gases within the gun.

No. 46,061.—ALEXANDER COCHARD, Port Richmond, N. Y.—*Beverage*.—January 31, 1865.—This invention consists of a mixture of sugar, vinegar, raisins, coriander seeds, and hops, to which may be added rock candy, orange peel, citric acid, and a weak infusion of pepper-mint. The mixture is put into a barrel, and enough water added to make thirty gallons, and the whole is stirred several times a day for four or five days. It is then strained and clarified, and put into bottles.

Claim.—The beverage prepared of the ingredients and in the manner specified.

No. 46,062.—G. F. J. COLBURN, Newark, N. J.—*Combs*.—January 31, 1865.—This invention consists in constructing the comb with a metallic back, so that the comb proper can be removed from the back in which it is fastened by a lip and a clamp screw. The metallic back which encloses the comb shuts into a handle of the same material.

Claim.—First, the combination of a movable metallic back with a comb, substantially as described, so that the comb can be readily taken out and replaced without injury to the said back.

Second, the use of a socket in one end of the metal back of a comb, in combination with a lip projecting from the end of the same, and with a clamp screw or other suitable fastening at the opposite end, substantially as and for the purpose specified.

Third, the combination of the metallic back of a comb with a handle or case of similar material, and fitting the same together, substantially as and for the purpose described.

Fourth, so constructing a comb that the comb part proper and the back may be readily detached, substantially as described.

No. 46,063.—PETER CONRAD, Rochester, Ill.—*Combined Roller and Corn Planter*.—January 31, 1865.—This invention consists in the combination of a roller with a corn-planting device in such a manner that the two devices will operate together.

Claim.—The bar R, provided with the horizontal wheel S, and arranged substantially as shown, in combination with the roller B for the purpose herein set forth.

Also, in combination with the bar R, wheel S, and roller B, a corn-planting device, substantially as set forth.

No. 46,064.—MOSES G. CRANE, Chelsea, Mass.—*Hot-air Engines*.—January 31, 1865.—This invention consists in so arranging the main cylinder, the air pump, the air passages, and exhaust valve, that the pressure shall be the same upon both sides of the pump piston during the entire movement; this object being effected by means of pipes which connect the top and bottom of the pump with the top and bottom of the air-heating vessels. The air-pump piston is so arranged that it will complete its stroke before the completion of the stroke of the main cylinder piston, which is consequent upon the stroke of the air pump so completed.

Claim.—In hot-air engines the arrangement of the main cylinder, the air pump, the furnace, the air passages, and exhaust valve, so that the air-pump piston shall work with equal pressure on each side thereof, substantially as set forth.

Also, the employment of the valve e, in the pump piston, in connection with the regulator valve in the passage between the pump and furnace, when arranged to operate substantially as specified.

Also, so operating the pump piston in the stroke which supplies the main cylinder that said piston completes its stroke before the main cylinder piston completes the stroke which is consequent upon said supply.

No. 46,065.—JOHN DANNER, Canton, Ohio.—*Tub for Washing and other purposes*.—January 31, 1865.—The invention is fully set forth by the claim.

Claim.—In combination with a washing tub composed of staves of wood, a metallic bottom, constructed and united thereto, in the manner substantially and for the purposes described.

No. 46,066.—SAMUEL DERR, Lockhaven, Penn.—*Stump Extractors*.—January 31, 1865.—The object of this invention is to obviate the inconvenience of drawing a large stump machine among stumps standing thickly, and through ordinary gateways and lanes; also that of using such machine for the purpose of extracting small stumps, whereby trouble occurs in passing round them, and also on account of the distance the driving power has to move to produce the required result.

Claim.—The arrangement of the legs B B B B under the frame A, so that they may occupy more or less breadth of space, substantially as and for the purposes herein specified.

Also, in combination with the above, the arrangement of the cross braces M M M M and tension rods P P, so as to adapt them to the variations in the position of the legs B B B B, substantially as herein set forth.

No. 46,067.—WILLIAM DISBROW, San Francisco, Cal.—*Horseshoes*.—January 31, 1865.—This invention consists in constructing a shoe of two plates or parts, the upper one being hinged at the toe end, by means of a jointed cross-bar, at the heel, and having attached to

each part, at the toe and heel, plates projecting upwards and inwards of a curve to fit the outer surface of the hoof, which is inserted within them before they are closed upon it. By then screwing to this hinged plate the lower part or shoe proper, the former is made rigid, and caused to hold securely to the hoof.

Claim.—A horseshoe composed of the parts A A and G, the former being connected by a hinge B at their front ends, and provided with the pieces D D and heel plates E E, the latter having oblique plates F F, which enter notches or grooves made in the sides of the hoof, and the part G, secured to the parts A A by screws, the whole being constructed, combined, and arranged, either with or without the leather or other material K, substantially as and for the purpose herein shown and described.

No. 46,088.—GEORGE H. S. DUFFUS, New Orleans, La.—*Retorts for Distilling Petroleum.*—January 31, 1865.—This invention consists in making the bottom of a retort dome-shaped in its interior for distilling petroleum.

Claim.—In stills for rectifying petroleum and other oils, or producing illuminating or other oils or gases from any substances capable of treatment by heat, making the bottom of the retort with a dome or its equivalent rising therefrom up within its interior, substantially as described.

No. 46,089.—GEORGE H. S. DUFFUS, New Orleans, La.—*Retorts for Distilling Petroleum.*—January 31, 1865.—This invention consists of a short-cylindrical box, having the top and bottom perforated with holes. These holes are directly opposite each other, and are connected by short tubes, forming passages through the box for air. These tubes are made of some porous mineral substance, so that they may be pervious to gas, which flows through the walls of the tube and mixes with the air, and ascends with it to the upper part of the tube, where it is ignited. The box is supplied with gas by a pipe, and is made adjustable, so as to be moved to or from the retort, as may be required.

Claim.—First, in stills for rectifying petroleum, or in which oils, coal, or other substances are treated by heat, arranging the furnace or burner by which the heat is communicated or created, so that it and the flames or incandescent fuel can be moved near to or further away from the retort, according to the condition of the work, substantially as described.

Second, the burner or furnace I, constructed substantially as described.

Third, the combination of the pervious cones with the gas pipe *h* and the perforated plates *i* and *j*, or their equivalents, substantially as described.

No. 46,090.—GEO. H. S. DUFFUS, New Orleans, La.—*Retorts for Distilling Petroleum.*—January 31, 1865.—This invention consists in surrounding the still with a jacket of some non-conducting composition, such as plaster of Paris and wood ashes, and also in the use of steam for the purpose of cleaning the retort.

Claim.—First, in stills for rectifying petroleum and other oils or producing illuminating or other oils or gases from any substances capable of treatment by heat, covering the still with a jacket, enclosing or composed of non-conducting materials, substantially as described.

Second, the use in stills for rectifying petroleum and other oils, or for producing illuminating or other oils or gases from any substances capable of treatment by heat of steam, for the purpose of cleaning the retort, substantially as described.

No. 46,091.—HENRY W. EASTMAN, Baltimore, Md.—*Crib and Cradle.*—January 31, 1865.—This invention consists in the combination of the several devices forming a folding crib, cradle, or trundle bed, also the attachment thereto of frames for stretching a mosquito bar.

Claim.—The combination and arrangement of the hinged sides N N, rockers M M, bolts and thumb nuts L, hooks K, and metallic frame O, all constructed and arranged substantially as and for the purpose set forth and described.

No. 46,092.—A. H. EMERY, New York, N. Y.—*Obtaining Spirits of Turpentine, Oil, Rosin, and other products, from Pine Wood.*—January 31, 1865.—This invention consists in using steam under pressure to extract the resinous and other matter from pine wood.

Claim.—First, passing a current of ordinary steam over and through the wood into a condenser in the manufacture of spirits of turpentine, rosin, &c., from pine wood.

Second, in the manufacture of turpentine, rosin, &c., directly from pine wood, subjecting the steam, either ordinary or superheated, to a pressure while it is in retort, and passing therefrom into a condenser.

No. 46,093.—FELIX J. EMERY, Springfield, Ill.—*Eaves Troughs.*—January 31, 1865.—This invention consists in bending one end of the sections out of which the trough is formed, so as to form a deep narrow groove, into which the straight end of the succeeding section is forced, a packing formed of India-rubber, enclosing a stout wire, being first inserted in said groove to add stiffness, and render the joint tight. The sections are then secured together by screws or rivets.

Claim.—The eaves trough above described, as a new article of manufacture.

No. 46,094.—SAMUEL EMLIN, Philadelphia, Penn.—*Street-sweeping Machine.*—January 31, 1865.—This invention consists in attaching a brush to a vehicle, so that the brush is vibrated

by the wheels in their progress along the street. During this vibration, it also receives other motion, which tends more efficiently to cleanse the way and insure the greater durability of certain portions of the machine, and, at the same time, to avoid the dispersion of dust.

Claim.—First, the vibrating brush, having a rising and falling motion, as hereinbefore set forth.

Second, the mode of driving the said brush by means of the pinions and ratchets upon the crank shaft.

Third, jarring the brush at the extremes of its vibrations, as herein set forth and described.

Fourth, so proportioning the gearing of the machine to the diameter of the wheels and length of the brush that the same surface shall be repeatedly swept, substantially in the manner herein set forth and described.

Fifth, combining the aprons upon the flanks of the machine with a vibrating brush, having lifting and jarring motions, as described.

Sixth, attaching the brush to the vibrating beam or arm by means of springs, in the mode and with the effect described.

Seventh, the device for lifting the brush from the street pavement by the hand of the attendant without stopping the motion of the machine when said brush is vibrated and operated, substantially in the manner hereinbefore set forth and described.

No. 46, 095.—CHARLES O. FARCIOT, Philadelphia, Penn.—*Canteen Plates, Cup and Funnel.*—January 31, 1865.—This invention consists in combining with a canteen one or two plates, leaving spaces between the canteen and plates for food, and also providing a funnel which secures the dishes in position, and is also useful for filling the canteen, and as a drinking cup.

Claim.—First, the combination of the valve E with the canteen G, when constructed in the manner hereinbefore specified and shown in the drawings hereto annexed.

Second, combining with the canteen G the plates H and H', so as to form cavities for containing provisions between the said plates and canteen body, the funnel A, and bag or cover B, in the manner and for the purposes hereinbefore set forth and specified.

No. 46, 096.—J. ALBERT ESHLEMAN, Philadelphia, Penn.—*Neck-tie Holders.*—January 31, 1865.—This invention consists in the employment of a plate so formed as to press its two extremities within the fold of the collar near the front button, and to carry a coiled spring on its inner side below the button, which spring passes over the bottom, and making a purchase thereon, the neck-tie passes once around the centre part of this plate, between it and the spring loop, to be tied in front.

Claim.—The plate or holder A, arranged for the reception and removal of a ribbon or tie passing around the central part of the plate, and between it and the spring, and for confinement to the collar, all as set forth.

No. 46, 097.—FRED. W. FLIEDNER, New York, N. Y.—*Manufacture of Boxes.*—January 31, 1865.—This invention consists in using veneers of wood cemented together across the grain, as a cheap substitute for pasteboard.

Claim.—The use in the manufacture of boxes of sheets of wood prepared substantially as described, as substitute for the sheets of pasteboard now used in the manufacture of paper boxes.

No. 46, 098.—ARTHUR FOLSOM, New York, N. Y.—*Coffer Dam.*—January 31, 1865.—In the ordinary method of making coffer-dams, two or more rows of piles properly hooped and shod with iron, are driven around the site of the proposed work a sufficient distance apart to admit the bracing requisite for strength, and to provide space for a quantity of clay or other puddling material for the prevention of leakage. When the coffer-dam thus constructed is of large size, the bracing of the sides thus exposed over their entire length to a pressure that cannot otherwise be adequately provided for, on account of the inconvenience and sometimes the impossibility of admitting anything within the interior line of piles for that purpose, involves an expense in construction which has often been greater than the cost of material and labor. The object of this invention is to provide a coffer-dam that is free to a great extent from these objections, and it consists in making it of wrought or sheet iron, stiffened and strengthened to the degree required by means of corrugations or angle iron ribs, and provided with appliances for adapting it to the irregularities of the bottom upon which it may be used.

Claim.—The coffer-dam, constructed and operated substantially in the manner described.

No. 46, 099.—L. A. FOULLEY, Boston, Mass.—*Apparatus for Cutting Photographs.*—January 3, 1865.—This invention consists in enclosing the pattern commonly used in cutting photographs in a frame hinged on one side, and clamped or hooked on the other, so that the paper and pattern are immovably held together.

Claim.—The apparatus herein described for cutting photographic pictures, passe partou frames, &c., arranged and operating substantially as described.

No. 56,100.—H. E. GIBBON, of Brooklyn, N. Y.—*Safety Guard for the Hammers of Firearms*.—January 31, 1865.—This invention relates to that class of guards designed to prevent the accidental discharge of fire-arms; and it consists in providing the hammer with a toothed or ratchet arc, into which a spring pawl engages, and thereby firmly holds up the hammer from striking. A projection at the end of the arc trips back the pawl so as to throw its spring off from a shoulder, when the hammer is drawn back to full-cock, thus leaving it entirely free to fall: in doing so this same projection, striking the tail of the pawl, resets its spring on its shoulder so as to put it in condition again to engage with the ratchet arc when the hammer is raised.

Claim.—First, the combination with the hammer of a gun of a toothed rack and spring detent, for holding the hammer locked in certain positions, substantially as above described.

Second, setting the detent for engagement with the rack, and also throwing it beyond the path of the rack by means of the same dog *d*, substantially as above described.

No. 46,101.—WILLIAM F. GOODWIN, New York, N. Y.—*Mounting Hand Mortars*.—January 31, 1865.—The rear end of the mortar is extended as a hollow sleeve, having no trunnions or cheeks. The support consists of a stake fitting into this sleeve with an elastic disk or spring interposed between the end of the stake and the base of the mortar. A slot in the stake, and a pin passing through it and the sleeve, allows play for the recoil.

Claim.—First, constructing a mortar with a hollow sleeve projecting from its base instead of trunnions or cheeks, substantially as above described, for the purpose of receiving the elastic cushion or any equivalent spring, and the end of a stake, as above set forth.

Second, the combination of the slot *E* and pin *D* with the aforesaid mortar *A*, sleeve *B*, and spring *C*, as and for the purposes specified.

No. 46,102.—JAMES J. GORMAN, Cincinnati, Ohio.—*Dead Centre Lift*.—January 31, 1865.—The object of this invention is to prevent a crank from stopping at the dead centres, and thus to dispense with the use of a balance wheel in converting reciprocating into rotary motion. This object is accomplished by a combination of springs and auxiliary pitmen. The spring is gathered up as the crank approaches its dead centre, and throws the crank over the same through the medium of an auxiliary pitman acting on the crank at an angle of at least 45°. The mechanism can be changed so as to work in either direction by means of a suitable reversing gear.

Claim.—First, the reciprocating rod *G*, with tappets *b b*, working beam *F*, and pitman *E*, in combination with the pitman *C* and crank *D*, constructed and operating substantially as and for the purpose set forth.

Second, making the rod *G* reversible and combining it with working beams *F F'*, pitman *E E'*, and crank *D*, substantially as and for the purpose described.

Third, the expansion bearers *d d*, applied in combination with the spring *J*, pitman *E*, and crank *D*, substantially in the manner and for the purpose specified.

No. 46,103.—C. E. GRAY, New York, N. Y.—*Apparatus for Rendering Lard, Tallow, &c.*—January 31, 1865.—This invention consists of a closed tank or kettle having a jacket covering the part which comes in contact with the fire. The space contains water, which is heated so as to render the lard in the kettle. The vapors and gases which escape from the lard during the process of rendering are carried through a condenser, and afterwards through a gas purifier, or they may be conducted into the furnace and burner.

Claim.—First, making a close water jacket in combination with the tank and a part of it, and arranging said water jacket so made a part of said tank in direct communication with the furnace, so that the water jacket shall intervene between the fire and the tank and act as a means of conducting and distributing the heat from the fire to and around the fat.

Second, using the steam generated in a close tank from the constitutional water in the fat, for the purpose of aiding and controlling the escape of the noxious gases and vapors, either to a superheater for consumption in the furnace or to a deodorizer for the purpose of deodorizing them, or to a condenser for the purpose of condensing them, in the manner substantially as described for the purpose specified.

No. 46,104.—GEORGE SHAW HARWOOD, Boston, Mass.—*Machinery for Oiling Wool in Carding Machines*.—January 31, 1865.—The claim and engraving convey an intelligible idea of the nature of this invention.

Claim.—First, the means and manner herein described of oiling wool while being fed to carding or other wool-preparing machine by direct application of the oil or lubricating mixture on to either or both feed rollers, substantially as set forth.

Second, in combination with carding engines or other wool-preparing machinery of otherwise ordinary or suitable construction, a covered oil tank or cistern for supplying either or both feed rollers of said machinery with oil, whether the same is effected directly by dripping the oil upon the roll or through the intermediary of a brush, roller, or band, or the mechanical equivalent thereof.

Third, in an oiling apparatus constructed for use as an attachment to carding or other wool-preparing machine, and in which the oil is distributed to either or both of its feed rolls, the combination of an oil tank with a dipper arranged for operation substantially as set forth.

so that the oil or lubricating mixture shall be thoroughly mixed and conveyed to the feed rolls directly or through the intermediary of a brush, cylinder, or apron, substantially as described.

Fourth, the employment of a roller or rollers made of any of the vulcanizable gums, in combination with a dipper and pressure roller.

Fifth, in combination with a dipper and pressure roller, two or more rollers revolving both upon their own axes and upon an axis common to them, substantially as herein described.

Sixth, the apparatus herein described for oiling wool on the card, the same consisting of a tank extending transversely the whole width of the feed rolls of a rotary dipper and a revolving distributor, when arranged to operate as described, so as to agitate and convey the oil from the tank directly to the feed roller or rollers.

No. 46,105.—CASSON HAYES, Madison, Wis.—*Orchard Ladder*.—January 31, 1865.—This invention consists in the application to a ladder of a back brace attached to the top of the side frames by swivel joints and having one bearing joint on a line with the centre of the same. Across and near the lower end of the brace there is a bar running parallel with the steps, and when not in use is fastened thereto by a button. In combination with those parts are side braces secured to the top by means of swivel joints, and near the lower end of the ladder by means of hooks and bolts.

Claim.—First, the back brace B, constructed with a single bearing point, substantially as shown.

Second, the adjustable side braces C C, in combination with the brace B, as and for the purpose set forth.

Third, securing the side braces C C by means of the hooks D and buttons *d*, as shown and described.

No. 46,106.—ANTOINE AUGUST HOFFMAN, New York, N. Y.—*Scroll Sawing Machines*.—January 31, 1865.—The object of this invention is to improve the devices for operating a scroll saw, and it consists in applying pivots or points to the adjustable centres of motion working in conical sockets or guards, and also the attachment of a spherical head to the ends of the saw working in sockets made in halves and held in place by a jam nut and screw, so that the saw can freely turn and be held in any position by a set screw through the socket bearing on the head.

Claim.—The application to scroll saw frames of the adjustable centres of motion constructed with pins or points and conical sockets and retaining guards combined substantially in the manner described.

Also, the application of the device by which the saw may be turned, consisting of a cylindrical pin with a spherical head, combined with a socket made in halves and held by a jam nut and set screw, substantially as described, for the purpose specified.

No. 46,107.—BIRDSILL HOLLY, Lockport, N. Y.—*Hot-air Furnace*.—January 31, 1865.—This invention consists of a metallic cylinder or drum enclosed in brick work; coal or wood can be burned in it; coal in the grate in the front part of the cylinder, and wood on a plate pushed forward over the grate. By drawing the plate back the wood ashes are scraped off from it by a narrow strip of metal which crosses the cylinder at the rear of the fire bed, the ashes falling into the grate and ash-pit. The flue passage, which is on a level with the grate, is separated from the body of the cylinder by a diaphragm, leaving only a narrow escape-opening near the combustion chamber.

Claim.—The combination and arrangement of the radiating cylinder A, or equivalent, fire pot B, sliding plate G, flue opening *f*, and bar *h*, substantially as and for the purposes herein specified.

No. 46,108.—ORSAMUS HOLMES, New Lenox, Ill.—*Thrashing Machine*.—January 31, 1865.—This invention consists in giving a longitudinal and tossing motion to the straw carrier, and imparting this same motion to the grain screen by levers connecting the two directly. Motion is also given to the straw shoe. Wire fingers fastened to and moved by the screen extend up beyond the straw carrier and toss the straw clear of the screen.

Claim.—The giving of a longitudinal shake and tossing motion to the straw carrier D by a pitman *b* and crank *a*; also, the connecting of the grain screen G to the carrier D through the medium of the levers E E, arranged as shown, in combination with the straw shoe F attached to the rear of the screen G, and provided with wires or rods *e e'*, substantially as and for the purpose herein set forth.

No. 46,109.—BENJAMIN JACKSON, Trenton, N. J.—*Safeguard for Protecting Pottery Ware*.—January 31, 1865.—This invention relates to a method of protecting pottery ware during the process of burning or baking, and consists in making the cylinders in which the article of ware are placed of a series of rings, so that one ring may be fitted over the other; the article to be burned or baked being fitted in each ring, and resting on pins thereon.

Claim.—A safeguard or "sagger" to receive articles of pottery ware while being burned or baked, composed of a series of rings or frames of fire-clay so constructed or arranged that they may be fitted one over the other and receive pins to support the articles fitted within, substantially as described.

No. 46,110.—PETER H. JACKSON, New York, N. Y., and SAMUEL EDDY, Brooklyn, N. Y.—*Windlass*.—January 31, 1865.—This invention consists of a chain drum having movable clutches so placed that the high parts are where the chain enters upon, and the lower parts where it leaves, the windlass. In addition the chain wheel has an annular space, with offsets, the better to adapt itself to the size of the chain.

Claim.—A chain wheel or windlass formed with radial ribs that are movable, substantially as specified.

Also, forming the annular space around a chain wheel with offsets C C, to better adapt the same to different sizes of chain, as specified.

No. 46,111.—OLIVER A. KELLY and ESTUS LAMB, Slatersville, R. I.—*Steam Engine Governor*.—January 31, 1865.—This invention consists in the employment of a revolving screw rod, to form the connection between the governor and the cut off or throttle valve, and applied in combination with an arm which extends from a rock shaft connecting with said valve, or from the valve spindle, the end of which is tapped to screw on said screw rod in such a manner that by the revolving motion imparted to said screw rod the valve is opened and closed independently of or in opposition to the action of the governor.

Claim.—First, the employment or use of a screw rod *b* screwing in the end of an arm *c*, which extends from the rock shaft or valve spindle *d*, and applied in combination with the governor and with suitable gear, substantially as and for the purpose set forth.

Second, the escapement wheel *k* and pawls *m m'* applied in combination with suitable bevel gear *e f*, screw rod *b*, and with the governor and valve gear, substantially as and for the purpose described.

Third, the shoe *r* and cam slot *b'* arranged in combination with each other and with the pawls *m m'*, escapement wheels *k*, screw rod *b*, and with the governor and valve gear, substantially as and for the purpose specified.

Fourth, making the shoe *r* in two parts which are hinged together, substantially as and for the purpose set forth.

Fifth, the tail *d** applied to the hinged shoe *r* and operating in combination with the bar *e** secured to the rock shaft *d*, substantially as and for the purpose described.

No. 46,112.—ROBERT KELLY, Tuscola, Ill.—*Gate*.—January 31, 1865.—This invention relates to the construction of gates where a brace is used to support the parts in connection with a perforated slide on the top thereof, held in position by means of a pin, for the purpose of preventing it from sagging.

Claim.—A gate constructed of uprights and slats and provided with an oblique or diagonal brace, one or more, a perforated slide and a pin or pins, all arranged substantially as and for the purpose herein set forth.

No. 46,113.—B. KLAHR, Bernville, Penn.—*Sawing and Boring Machine*.—January 31, 1865.—This invention consists of a carriage on which the post is clamped, and is moved by a lever and governed by distancing stops which regulate the length and relative distance of the mortise holes in the posts. When used for ripping or tapering the ends of the rails, the hinged yoke is thrown over the side, and the timber supported by the carriage and an end bracket, and presented in the required oblique position to the saw, whose oscillating frame is raised so as to expose the saw through the slot in the carriage, when its services are needed.

Claim.—First, the combination of the parts by which the post is secured in position and moved to the tool, consisting of the carriage C, the yoke *b* and clamping screw *a*, with the stapled lever *c* acting in connection with the pins *d d** and stop *e*, substantially as described.

Second, the movable bracket J and forked rest *i*, in combination with the pin *j*, carriage C and saw I, constructed and operating substantially as and for the purpose set forth.

Third, the oscillating frame *r* in combination with the saw I, carriage C, and frame A, constructed and operating substantially as and for the purpose described.

No. 46,114.—ROBERT S. LAIRD, Sandwich, Ill.—*Lantern Frames*.—January 31, 1865.—This invention consists in constructing the wire guards of a lantern in two parts with hinges below and catches above, so that both sides may be turned down at pleasure to clean the globe, or in case of fracture to substitute a new one.

Claim.—The wire guards A attached at their lower ends to semicircular bars E E which are connected to the base B of the lantern by hinges or joints *a*, and attached at their upper ends to semicircular bars F F which are secured to the top C by catches G G, substantially as and for the purpose specified.

No. 46,115.—CHARLES LANG, Worcester, Mass.—*Machine for Making Lace Paper*.—January 31, 1865.—This invention consists in grinding off the elevated portions of embossed paper, which is accomplished by passing the paper between two rollers, one of which is covered with ground glass or emery, the other is impressed with a duplicate of the design on the paper. The grinding roller is made to revolve with the greatest velocity.

Claim.—Removing the elevated parts of embossed paper by means of an apparatus, the principal parts of which consist of two rollers, substantially in the manner and for the purpose described.

No. 46,116.—CHRISTOPHER LIDREU, Aurora, Ill.—*Cultivator*.—January 31, 1865.—This invention consists of a beam running parallel to and just over the axle, and is furnished with friction rollers. Two plough standards are attached to its ends. A slotted standard, carrying two slotted arms at right angles to it, rises from its centre. In these slotted arms are fastened two additional plough standards. Below the centre of the standards two rods work in slots, and pass through the axle to the feet of the driver, by which the ploughs are adjusted laterally. Two combined levers raise the parallel beams over the axle, and with it the four plough standards.

Claim.—The rising and falling bar E, operated by the levers L L', and having the plough standards I I permanently attached to it, as shown, in combination with the adjustable plough standards F F, attached to said bar as described, and operated by the crank shafts k, all arranged substantially as and for the purpose set forth.

No. 46,117.—WILLIAM A. LIDTHALL, New York, N. Y.—*Tubular Condensers*.—January 31, 1865.—This invention consists in the combination of two exhausting fans, for carrying a current of air, to pass through the tubes in the body of the condenser, with the tubes, division plates, and reservoir for water. The tubes are arranged in a case, and the division plates are attached to the case in such a way as to cause the water to have a largely extended run in passing through the case and around the exterior of the tubes, while the steam to be condensed or the water to be cooled passes through them with the current of air.

Claim.—First, the combination of the exhausting fans J' J'', or their equivalent, with the tubes C and division plates a a' a'' a''' a''', as and for the purpose set forth.

Second, the combination of the exhausting fans J' J'', or their equivalent, with the tube C and reservoir M, as and for the purpose set forth.

No. 46,118.—JOHN A. LLOYD, St. Paul, Minn.—*Tire-shrinking Machine*.—January 31, 1865.—By means of keys and other devices the operator is enabled to secure firmly the tire in the most advantageous position, and by means of a lever the tire may be upset without the aid of a hammer.

Claim.—First, constructing the lugs B B with horizontal and vertical key seats, so that the article to be secured may be pinched either upon its horizontal or vertical surfaces, at pleasure.

Second, in combination with the bed plate A of a machine for shortening tires the lever D, lugs B B, and keys C C, substantially as described and for the purpose set forth.

No. 46,119.—GEORGE E. LORD, Utica, N. Y.—*Spring Bed Bottom*.—January 31, 1865.—This invention consists of spiral springs placed in openings of the slats of the bed bottom, pins with disk heads passing through the springs and resting on the lower ends. The bed rests on the disk heads of the pins.

Claim.—The combination and arrangement of the spring C with the slat B, the disk-headed pin D, the cap E, substantially as and for the purpose set forth.

No. 46,120.—R. LORD and L. HUTTON, Rittenhouse, Penn.—*Doffing Apparatus for Carding Engine*.—January 31, 1865.—The object of the arrangement herein claimed is the better securing a uniform lap without the aid of a reciprocating comb and by a continuous process, being designed as an improvement on Boyd's arrangement, as shown in patent No. 24,092.

Claim.—The carded cylinder B, carded rollers C, and plain stripping or clearing roller D, when combined with a carding engine, and arranged and operating as and for the purpose herein set forth.

No. 46,121.—F. LÜDKE, New York, N. Y.—*Folding Chair or Table*.—January 31, 1865.—This invention consists of a seat or top of flexible material, supported by a series of radiating arms hinged to a central hub, secured to the upper end of a sliding staff, in combination with hinged braces connected with the radiating arms and made to radiate from a sleeve through which the staff slides. The staff is supported by hinged legs, connected by toggle arms with a ring fitted on the lower end of the central staff.

Claim.—First, the vertically sliding staff A, with hub B, and radiating arms C, in combination with a sleeve F, braces E, hinged legs G, and toggle arms H, all constructed and operating substantially as and for the purpose set forth.

Second, the combination of the radiating arms C and braces E with a piece D of flexible material, and with legs G, substantially as and for the purpose described.

Third, the toggle arms H, in combination with the folding legs G and central staff A, applied and operating substantially as and for the purpose specified.

No. 46,122.—AZEL S. LYMAN, New York, N. Y.—*Air Pump*.—January 31, 1865.—This invention consists of an air pump, which is supported in bearings in such a manner as to have an oscillating motion. The piston is attached to a balance-wheel operated by a crank. In the lower part of the cylinder is a valve closing the air tube, and to which is attached a rod extending down from the cylinder and surrounded by a spring packing. The end of this

rod rests on an inclined plane, so situated that the ascent of the piston commences while the valve-stem is riding up the inclined plane, thus opening the valve, which, when the piston descends, is closed by the same means. The air escapes through small holes in the piston and cylinder cup.

Claim.—First, an oscillating air or vacuum pump whose valve is operated by a positive movement derived from its vibrating motions, and independent of the piston, substantially as above described.

Second, constructing and operating the valve and its stem of a vacuum pump, substantially as above described.

Third, the combination of the inclined plane J with the valve and valve-stem of an oscillating vacuum pump, substantially as and for the purpose above described.

Fourth, packing the joint around the valve-stem by means of the elastic ring *r* and the packing ring *h*, substantially as above described.

Fifth, packing the joint on the hollow journal of the pump where it unites with the air tube by means of a packing ring, substantially as above described.

No. 46,123.—WARREN LYON, New York, N. Y.—*Drilling Machine.*—January 31, 1865.—The operative parts of this drill are the same in all respects, except in their arrangement, as those described in the Lyons patent, dated September 20, 1853. The table which supports the work to be operated upon is, however, arranged in a different manner. Thus, the arm which supports the table has an eye or socket at one end which embraces a cylindrical spindle fixed in a vertical position to the upright post or framework of the machine, said arm being free to be elevated to different heights and placed in different radial planes, and which may be fixed in any desirable position by a set screw. The manner in which the table is adjusted upon the outer end of the projecting arm makes it convenient to substitute one table for another, and thus render the machine convenient for drilling metallic objects of different shapes. One table, with a clamping device attached to it for clamping nuts or square bars of various diameters, is the subject of the second clause of the claim.

Claim.—First, the arrangement, as herein shown and described, of the levers I L, drill arbor D, with weight F attached, the counterpoise M on lever L and the rod N, for the purpose specified.

Second, the projection *u* and sheath *p p* on the face or upper side of the bed plate P, in combination with the slide R', screw S, and the adjustable arm Q, to which the bed plate is attached, all arranged substantially as and for the purpose set forth.

Third, the bracket C, with the bearings *a a* attached, when used in combination with the drill arbor D and its concomitant parts, as herein shown and described.

No. 46,124.—JOSEPH C. LYON, Auburn, N. Y.—*Testing Oil Wells.*—January 31, 1865.—The object of this invention is to ascertain throughout the entire length of the well where oil may be obtained, and to interpose above and below an oil fissure water-gas or other substance which might interfere with the flow and delivery of oil.

It also consists in the combination and arrangement of two air chambers, made flexible, with air and discharge pipes, whereby to cut off above and below the chambers, when inflated with foreign substances, and thereby allow oil to flow between the two air chambers and out of the discharge pipes.

Claim.—The combination and arrangement of two flexible air chambers with the air and discharge pipes, so that the air chambers can be placed at any point within the walls of oil wells, and there be inflated, whereby to cut off above the upper and below the lower chamber, water-gas and other substances, and thereby allow the oil to pass from a fissure between the two chambers and out of the discharge pipes, substantially as herein set forth.

No. 46,125.—ISAAC M. MILLBANK, Greenfield Hill, Conn.—*Breech-loading Fire-arm.*—January 31, 1865.—This invention is set forth in the claim.

Claim.—A new breech-loading fire-arm, combining the following elements, namely: The wedge C, rotating on a hinged arm transversely to the axis of the barrel and provided, as well as the faces on which it impinges, with cleaning grooves *e*, the front face of the breech-piece having an annular bead projecting forward into a corresponding groove in the rear of the barrel, so that by the withdrawal of the wedge the breech-piece may be freed to move to the rear sufficiently to enable the bead to clear the sides of the groove as the hinged breech-piece is rotated out of its chamber, and on being returned charged may be driven home with the bead pressing upon the elastic packing of the groove, the whole arrangement thus described working upon or contained within a frame A, which secures the barrel to the abutment.

No. 46,126.—EZRA MILLER, Janesville, Wis.—*Car-coupling and Buffer.*—January 31, 1865.—The object of this invention is to provide for connecting cars having their coupling hooks to cars of locomotives having other forms of couplers; also to construct coupling hooks partly of wood and partly of metal, in such manner as to obtain all the strength of the one and the lightness and cheapness of the other; also to so form these hooks that they will bear evenly on their stirrups and be less liable to wear away and tilt over on one side; also to provide for connecting together each one of a train of cars in such manner that the lateral jerk-

ing motion of a train and all the unsteadiness and injurious effect occasioned thereby will be effectually prevented, and at the same time the longitudinal shocks occasioned by suddenly stopping and starting a train be resisted. For the said purpose a contrivance is employed which is located in a line with the strongest part of a car body, viz., the flooring timbers.

Claim.—First, so constructing hooked-head car couplings that they are adapted to receive links and other forms of couplers and form connections therewith, substantially as described.

Second, a hooked-head car coupling which is composed of wood and metal, constructed substantially as described.

Third, bending the heads or forward portions of the shanks of coupling hooks in such manner as to give them an even bearing on their stirrups and thus prevent them from tilting laterally in consequence of wear, substantially as described.

Fourth, locating an elastic buffer in the end of the buffer beam A of a platform which is elevated so as to be brought in a horizontal plane with the bend of the car body, substantially as described.

Fifth, constructing the buffer head D' with a square shank D, having a rounded extension D'' on its ends, substantially as described.

Sixth, preventing lateral thrust of cars in motion by means of interlocking buffer heads, constructed and operating substantially as described.

No. 46,127.—JOSEPH A. MILLER, New York, N. Y.—*Casting Grate Bars for Furnaces.*—January 31, 1865.—This invention consists in casting the grate bars and moulding the patterns on either side of a suitable chill or core, which has a tongue on each of its edges fitting in and forming a groove on the upper edge of the grate bar when cast.

Claim.—Casting two bars simultaneously on the same core, substantially in the manner and for the purposes set forth.

No. 46,128.—THOMAS MILLER, Columbus, Ohio.—*Canal Scraper.*—January 31, 1865.—This invention consists in providing a scraper made movable about a pivot, so that an angle of any desirable obliquity can be presented to the current by the person operating the machine, by means of which obliquity the scraper can be guided to any part of the channel, to tear up vegetable growth or sedimentary deposit, and to allow the same to be washed off by the current.

Claim.—The combination and arrangement of the tongue with projecting footboard and parallels, whereby the movable principle is attained for the scraper, subject to the control of the operator, substantially as set forth and for the purposes specified.

No. 46,129.—ENOCH R. MORRISON, New York, N. Y.—*Shingle Machine.*—January 31, 1865.—This invention is designed as an improvement on the patent granted to the present patentee, November 22, 1853, and it consists in the application to a shingle machine of an elastic table, pressure plate, projections, with their operating cams for retaining and releasing a tooth-bar, together with an arrangement of jointers for jointing the shingles.

Claim.—Forming the table C of a spring plate in such a manner as to furnish an elastic surface its whole length, the same being provided with two projections c c, and operating in combination with the riving knife b, substantially in the manner and for the purpose herein set forth.

Also, the pressure plate M, made elastic by the spring o, in combination with the way N and tooth bar E, in such a manner that said plate will rise over the bar, but produce a pressure on the shingles in the rear, substantially as specified.

Also, the projections k' on the under side of the pressure plate M, which force the riven shingle to the bed plate if too short to be borne upon by the extreme end of the pressure plate M, the whole arranged as herein set forth.

Also, the arrangement of the gauge slide P, lever r, and cam bar Q, in combination with the tooth bar E, projection R, and cam O, to retain and release the said tooth bar in the manner substantially as herein specified.

Also, the arrangement of the bar T, provided with the cams c' c' and block U, in combination with the tooth bar F and the cams V V, for retaining and releasing the said tooth bar, substantially as herein set forth.

Also, the combination and arrangement of the jointers Y, arms h' h', guides z, and spring or springs g' in such a manner that said jointers act centrally on the shingles substantially as herein set forth.

No. 46,130.—ISAAC D. MYERS and M. D. WELLMAN, Pittsburg, Penn.—*Cotton Seed Planter.*—January 31, 1865; antedated January 19, 1865.—The object of this invention is to overcome the difficulty of the cotton seed becoming matted, and clogging the machine. The hopper is vibrated in the usual manner, with a horizontal shaft running lengthwise over the centre of the hopper with a crank in its centre to which is attached an upright shaft working perpendicularly, with arms projecting therefrom for the purpose of separating the seed from the cotton.

Claim.—First, The use of a feeding rod having a finger or fingers which vibrate up and down through a suitable orifice in the bottom of the seed box, so as to feed a few seeds only at a time and that at regular intervals, substantially as described.

Second, also, in combination with the feed rod and fingers, wires so placed in that part of the rod which passes through the cotton in the feed box, for the purpose of loosening the mass of cotton seeds and separating them from each other, substantially as described.

Third, also the use of the sliding frame with or without the inclined planes, and operated substantially as described, for the purpose of supplying the cotton seed into the hopper box.

Fourth, also the use of the curved projections *r r* on either side of the hopper box, to prevent the cotton being fed too fast into the hopper box, and clogging therein, substantially as described.

No. 46,131.—FREDERICK D. NEWBURY, Hudson City, N. J.—*Rammer for Revolving Fire-arms*.—January 31, 1865.—This invention consists of a lever or rammer pivoted near its rear end, so that its connection acts as a swivel. In front of said joint is a projecting lug at right angles to the same, and which carries a pivoted arm that pushes in the ammunition, when the main rammer is used as a lever.

Claim.—The method of attaching the ramrod to the frame of the piece by the use of revolving standard S, in order to permit the employment of the same in combination with a cylinder, constructed, arranged, and operated substantially as set forth in this specification.

No. 46,132.—JOSEPH W. NORCROSS, Middletown, Conn.—*Row-lock*.—January 31, 1865.—This invention consists of a crutch for the reception of the oars which bear on a pintal, on the end of which are inclined planes, the same making the plates on which the pintals are secured give elevation or depression to the row-lock.

Claim.—The inclined planes in combination with the row-lock and pin on which the same swivels, whether the same be secured by the plate or gunwale or the row-lock, substantially as and for the purpose herein set forth.

Also, the spring catch applied in combination with the row-lock and with the pin on which it swivels, substantially as herein described, for the purpose of holding the row-lock in and prevent its coming out spontaneously.

No. 46,133.—CHARLES PARHAM, Philadelphia, Penn.—*Sewing Machine Stitch*.—January 31, 1865.—This invention relates to a machine peculiarly adapted to button-hole work. The needle has two motions to one of the shuttle, so that the latter carries its thread through only every alternate needle thread loop, and not through every loop.

Claim.—A machine-made stitch, formed by first making a loop in one thread and passing a second loop of the same thread through the first loop, and then passing a second thread through the second loop, and drawing up the slack of the threads and loops tightly in the cloth or other material as it is fed along to receive the stitches, as set forth.

No. 46,134.—A. H. PERKINS, Chicago, Ill.—*Process for Manufacturing Under-ground Pipes*.—January 31, 1865.—This invention consists in making pipes by casting prepared pitch, or other bituminous substance, between two concentric tubes of heavy fibrous paper or felt.

Claim.—Manufacturing pipe by casting prepared pitch or other bituminous substances or compounds between two concentric tubes of heavy fibrous paper or felt, or its equivalent, substantially as and for the purposes herein set forth.

No. 46,135.—CHARLES PERLEY, New York, N. Y.—*Riding or Warping Bit*.—January 31, 1865.—This invention consists of two riding bits which are grooved, the line or hawser passing around both bits in their grooves.

Claim.—The pair of grooved riding bits, formed and applied as and for the purposes specified.

No. 46,136.—LOUIS PETERSON, Baltimore, Md.—*Fastening Pockets to Billiard Tables*.—January 31, 1865.—This invention consists in constructing a pocket frame with ears in such a manner as to be easily attached and detached from the table, without disturbing the other parts.

Claim.—The peculiar construction of the metallic frame carrying the pocket, as described within, and the manner of fastening these frames to the bands of billiard tables by means of screws passing the wood-work of said bands and screwed into metallic nuts sunk into them, substantially as specified hereinbefore.

No. 46,137.—JOHN C. PFIEL, Arenzville, Ill.—*Gang Ploughs*.—January 31, 1865.—This invention consists in the arrangement of parts by which the relative position of the plough beam and draught pole are maintained, after the former has been depressed by the foot of the driver.

Claim.—The arrangement of parts by which the relative positions of the plough beam and the draught pole are maintained after the front of the former has been depressed by the foot of the driver, and consisting of the tension chain K and lever G, with its retaining rack J, the points of attachment being the draught pole B and the frame A, the whole constructed and operated as described and represented.

No. 46,138.—ANSON H. PLATT, Yellow Springs, Ohio.—*Lamp Burner*.—January 31, 1865.—This invention consists in first placing the wick regulator on a horizontally movable shaft, so as to regulate one or two wicks as required. A horizontally sliding elastic pin is used to fasten the chimney.

Claim.—The laterally movable wick regulator H, operating substantially as and for the purposes herein specified, whether employed for regulating one or two wicks.

Also, the horizontal sliding elastic bolt D for fastening the chimney, substantially as herein specified.

No. 46,139.—WILLIAM PLATT and A. G. BURNHAM, Greenfield, Penn.—*Hay Loader*.—January 31, 1865.—The object of this invention is to provide means, in connection with the elevator, by which the rake may be readily raised or lowered by a person upon the load. The invention will be understood from the claim and engraving.

Claim.—In combination with the elevator C, the arrangement of the rod *o* and the rocking frame *n n'*, pivoted on the bar *i* and connected to the rakes D, by which the latter are raised as may be required, substantially as described and represented.

No. 46,140.—E. L. PRATT, Boston, Mass.—*Adjustable Gun Scraper*.—January 31, 1865.—The head of the gun scraper, into which the end of the ramrod screws, carries several longitudinal spring arms surrounded by a sliding ring or collar. Each arm carries a triangular shaped scraper, capable of oscillation, or of removal and adjustment or replacement.

Claim.—So applying each scraper blade *c* that it swivels or turns upon or with respect to its spring or wire *b*, for the purpose substantially as set forth.

Also, making each scraper *c* removable for repair, substitution, or adjustment, substantially as set forth.

No. 46,141.—CHARLES H. REICHMANN, New York, N. Y.—*Coal Oil Stove*.—January 31, 1865.—The object of this invention is to obtain a simple portable stove for burning coal oil economically, and it consists of a lamp having a sheet-metal chimney, the upper part of which is surrounded by a sheet-metal drum, on the top of which and over the top of the chimney is placed a kettle or other vessel.

Claim.—First, coal oil stove composed of one or more lamps provided with draught chimneys, and arranged in connexion with a drum, substantially as herein described.

Second, in combination with a coal oil stove constructed and arranged as above set forth, the slide or door *h* and glass *f* applied to the lower part of the draught chimney, in the manner and for the purposes specified.

No. 46,142.—PETER RIORDAN, Washington, D. C.—*Safety Valve Regulator*.—January 31, 1865.—The object of this invention is to guard against the liability of explosion of boilers by reason of undue pressure from insufficient action of the safety-valve, with the usual mechanical arrangements, and to indicate the amount of steam pressure exerted on the boiler, and readily reduce it when becoming excessive.

Its novelty consists in the combination of cylinders having different diameters, with piston heads, port *a'*, valve F, spring E, adjustable collars G, hollow graduated shaft D, and the apertures *d*.

Claim.—First, in combination with a cylinder formed in two parts, A A', of different diameters, the piston heads B B' when so arranged that the effective area of the head B on that side next the steam port *a* exceeds the effective area of the head B' on the side next the port *a'*, by as much as the area of the safety-valve divided by the number of times by which the length of the long arm of the safety-valve lever exceeds that of short arm.

Second, the combination of the valve F, spring E, and adjustable nut or collar G, with the hollow graduated shaft D and apertures *d*, the whole being arranged and employed substantially as and for the purpose set forth.

No. 46,143.—J. F. RICH, Chatham Run, Penn.—*Process for Manufacture of Fuller's Soap*.—January 31, 1865.—This invention consists in a soap made of the liquor in which wool and card strippings, or card strippings and other greasy waste, have been scoured, said liquor being treated with potash lye or other saponifier, additional fatty matter being added, if sufficient should not be obtained from the scouring process.

Claim.—A soap made by treating the liquor in which wool and card strippings or other greasy waste have been scoured with salt alkalies or other saponifiers, substantially in the manner herein set forth.

No. 46,144.—SAMUEL J. SEELY, New York, N. Y.—*Press and Bulkheads*.—January 31, 1865.—This invention consists in building hollow piers of metallic tubular sections so formed that each tube or section shall be firmly locked between two tubes or sections when arranged in lines or angles to form the pier of any desired shape, according to its location. The tubes, when two or more sections are set in place, are filled with rubber, gravelling, cement, or plaster, to fully exclude water therefrom. A chamber is formed partly in each tube, which, when two tubes are united, shall truly register throughout the entire length of the tubes, and be filled with wood, plaster, or cement, to wholly prevent the passage of

water between them when in position. Into the separate sections or tubes, whether above or below the water line, are introduced lateral openings, into which is placed some transparent medium, through which may be admitted to the interior of the pier, or to any room, chamber, or division into which the whole structure may be divided, when these openings are protected by suitable fenders, in order to utilize the interior space between the walls of the pier.

Claim.—First, forming water-tight walls partly subaqueous, for piers or similar structures, of mitre-locked sections, to utilize the area they enclose, substantially in the manner described.

Second, forming sections for the construction of piers, substantially as described, so that one will firmly interlock with another and exclude the passage of water between them, as set forth.

Third, the combination, in piers or similar structures, of sections that will permit the entrance of light to the area they enclose, with suitable fenders to protect them, arranged substantially in the manner and for the purpose set forth.

No. 46,145.—SAMUEL J. SEELY, New York, N. Y.—*Car Wheel.*—January 31, 1865.—The object of this invention is to produce a strong, light, and durable car wheel, and one that will run with comparative silence; and to this end the invention consists in combining a cast metal hub with a metallic rim, by corrugated metal disks.

Claim.—First, the combination of the flanged hub with the flanged rim by means of the corrugated face plates, substantially in the manner described for the purposes set forth.

Second, the wooden disk arranged between the rim, the hub, and the face plates, substantially as and for the purposes described.

No. 46,146.—SAMUEL J. SEELY, New York, N. Y.—*Construction of Docks.*—January 31, 1865.—This invention consists of a metallic skeleton dock, composed of piles, columns, or other tubular supports, and tied by beams, guides, trusses, or cords, combined with a fender and springs to prevent injury to either the dock or vessels.

Claim.—First, the construction of a dock, lock, or other subaqueous structure exposed to the contact of vessels, having metallic tubular supports united together with beams or girders, or trusses of iron, or wood and iron combined, in combination with a fender of wood or iron, or both, combined with an elastic substance or spring interposed between the dock and fender to prevent injury to the structure from shock or pressure applied to the fender, constructed and operated substantially in the manner above described.

Second, the combination of a tank vessel or wall of iron, or iron and cement combined, having tubular supports, with a fender, and forming a dock, lock, wall, or other subaqueous structure exposed to the contact of vessels, so constructed and operating as to ease off all sudden shocks, and to be braced within the structure, substantially as above described.

No. 46,147.—SAMUEL J. SEELY, New York, N. Y.—*Rudder with corrugated surfaces.*—January 31, 1865.—This invention consists in the application of corrugated iron to the surface sides of rudders.

Claim.—Corrugating the sides of the blade of rudders, substantially in the manner and for the purposes set forth.

No. 46,148.—S. B. SEXTON, Baltimore, Md.—*Coal Scuttle.*—January 31, 1865.—This invention consists in placing a perforated metal plate by means of hinges about midway of an ordinary coal scuttle, thus dividing it into two parts, said plate serving also as a sifter for the coal. The plate is so constructed with flanged sides that when the scuttle is used the flanges above mentioned prevent the coal from dropping over the sides of the scuttle on the floor.

Claim.—First, providing a coal scuttle with a hinged plate, which is so arranged within the scuttle as to serve as a screen for sifting coal dust and ashes, or as a shield for preventing lumps of coal from escaping over the sides of the scuttle during the act of replenishing the fire.

Second, constructing the hinged plate A with flanged sides, substantially as described.

No. 46,149.—H. M. SHAW, Tremont, Sandusky county, Ohio.—*Machines for Cutting Staves.*—The knife frame is attached by pitmen to the wrists of cranks, which receive their effective motion from fly wheels whose slotted radial arms receive the said wrists, and thus cause the cranks to revolve in such a manner that, in the descent of the knife, the leverage power shall increase as the wrists gradually approach the centre of revolution of the fly-wheel shaft.

Claim.—The slotted arms *a* of the fly wheels *c c* to receive the pins *E E* of the cranks *F F*, the shafts *G G* of which are placed out of line with the fly-wheel shaft *B*, and all arranged in connection with the pitman *H H*, to operate the knife frame *I*, substantially as and for the purpose herein set forth.

No. 46, 50.—H. M. SHAW and C. B. STILWELL, Tremont, Ohio.—*Bread and Meat Slicer.*—January 31, 1865.—This invention consists in the employment of a rising and fall

ing gate, with a gauge and knife attached, the latter having, besides the rising and falling movement given it by the gate, a reciprocating movement, the gauge being adjustable, and all arranged with a feed box in such a manner that, by the turning of a shaft continuously in one direction, the article in the feed box will be cut or sliced expeditiously.

Claim.—First, the knife H, attached to a sash or gate B, having a rising and falling movement communicated to it by a crank and connecting rods or their equivalents, and the knife having an automatic reciprocating movement communicated to it from the sash or gate through the medium of the lever I and rod J from the crank or drawing shaft, substantially as and for the purpose set forth.

Second, the adjustable gauge F attached to the sash or gate B, substantially as shown, when used in combination with the knife H, and all arranged to operate substantially as and for the purpose specified.

The adjustable bottom G, in combination with the gauge F and knife H, all arranged to operate as and for the purpose set forth.

No. 46,151.—ELBRIDGE SIMS, Antwerp, N. Y.—*Clothes Dryer*.—January 31, 1865.—This invention relates to devices for holding clothes, and consists of a series of frames connected by pivots suspended from a wall and provided with arms so arranged that the whole may be expanded.

Claim.—A clothes dryer composed of a series of frames A B C, connected together by pivots or joints suspended on a wall or vertical support, and provided with bars D, all arranged substantially as described.

No. 46,152.—DWIGHT SLATE, Hartford, Conn.—*Turning Lathe*.—January 31, 1865.—This invention consists in attaching to the back shear of a lathe a horizontal guide bar, upon, and guided by which, moves a slide, attached by a connecting rod to the transverse sliding cutter carrier. By varying the angle of the axis of said guide from that of the lathe any desired taper can be given to the object turned thereon.

Claim.—The employment, in combination with the guide bar *g*, and with the adjusting screw *d*, or its equivalent, of the tool carriage of the connecting bar *f*, arranged substantially as herein set forth.

Also, the employment, in combination with the guide bar and connecting bar aforesaid of the slide *l* joined to the connecting bar and locked to the guide bar, substantially as and for the purpose herein before specified.

No. 46,153.—A. F. SPALDING and SALMON F. SCOTT, Winchendon, Mass.—*Meat Chopping Machine*.—January 31, 1865.—A driving wheel being put in revolution imparts a continuous rotary motion to a tub which contains the meat to be cut, and also communicates to two knives which cut the meat, reciprocating alternate motions in vertical planes, so that they operate with a drawing stroke upon the meat. By means of the rotary motion of the tub, every part of the material is brought under the action of the knives.

Claim.—The improved machine constructed substantially in manner and so as to operate as described—that is to say, with the safety spring or springs *v* arranged with each of the knife carriers and its operative mechanism as described, the knife or knives being arranged to work in a rotary tub in manner as explained.

No. 46,154.—GEORGE STONE, Boston, Mass.—*Tool for Drawing Spikes*.—January 31, 1865.—In this device the jaw formed on the extremity of the handle is pivoted to and plays between two pieces of metal shaped somewhat like the letter S, the convex edge of one limb of each forming, together, a rocking fulcrum, while the opposite extremities of the S-shaped pieces have a less extended curvature, are brought more nearly together, and are consolidated into one single jaw by the interposition of a solid piece of metal between them.

Claim.—The handle or lever A, formed or provided with the jaw B, in connection with the rocker-shaped fulcrum *c c*, provided with the jaw D, and having the handle or lever secured between them by a pivot bolt, substantially as and for the purpose herein set forth.

No. 46,155.—PETER SWEENEY, New York, N. Y.—*Corn Sheller*.—January 31, 1865.—This invention consists in the employment of a revolving open cylinder with a helical flange, and pegs in combination with a series of hoppers situated at suitable distances apart around the periphery of the flanged cylinder in such a manner that ears of corn dropped endwise into said hoppers are brought in contact with the flange and pegs of the cylinder, and by their combined action the corn is shelled. The hoppers are composed each of three plates perforated with slots of sufficient size to admit the passage of the kernels. Two of these plates are placed in a radial, and the third in a tangential position, and the radial plates are rigidly secured to the frame, whereas the tangential plate is made yielding, so that by its action the ears are held in contact with the periphery of the cylinder while passing through the hopper.

Claim.—First, the revolving open cylinder D, with a helical flange *b*, and pegs *d*, in combination with a series of hoppers F, arranged around said cylinder and operating substantially in the manner and for the purpose herein shown and described.

Second, the perforations *g*, in the plates *c' d'*, composing the hoppers, arranged substantially as and for the purpose described.

No. 46, 156.—N. S. THOMAS, Painted Post, N. Y.—*Process for Making Concentrated Fluid Extracts*.—January 31, 1865.—This invention consists in grinding the drug or material to be operated upon to powder, after which it is moistened with a small quantity of the liquid, by means of which the extract is to be made. The mass is then subjected to pressure, whereby the liquid and a greater part of the soluble portions of the drug are expressed. This operation is repeated until the soluble matter is entirely exhausted and a concentrated extract obtained without evaporation.

Claim.—The within described process of producing concentrated fluid extracts by bringing the crude drug gradually in contact with the desired measure of liquid to be represented by the extract, and exposing it after each application of liquid to a heavy pressure substantially as set forth, whereby extracts of uniform strength can be made and both heat and evaporation are avoided.

No. 46, 157.—S. TOTTEN, Brooklyn, N. Y.—*Apparatus for Fluting Trimmings*.—January 31, 1865.—A frame being properly arranged, two rows of heated iron rollers are so arranged that each of the upper rollers rests on and between two of the lower rollers, the fabric being laid under a lower roller and over an upper one so as to embrace nearly the whole surface of each. When the rollers have become cool the fluting is accomplished.

Claim.—A fluting apparatus consisting of a series of rods C D, and one or more frames A, arranged and operated substantially as shown and described.

No. 46, 158.—THOMAS UREN, New York, N. Y.—*Artificial Limbs and Hands*.—January 31, 1865.—This invention is set forth in the claim.

Claim.—The combination of the expansion and contraction cords with each other and with the artificial upper and fore-arm hinged at the elbow joint, and with the straps or equivalent thereof, for securing the artificial arm to the body, and with which the said expansion and contraction cords are attached, substantially as described, whereby the fore-arm can be lifted and bent or thrown out and straightened at the will of the person wearing it, by a simple motion forward or backward of the stump of the amputated arm.

Also, the combination of the hinged fore-arm with the balance cord and spring, substantially as described, whereby the weight of the hinged fore-arm is balanced by the said spring, and when desired can be made to hang naturally, as described, while at the same time the fore-arm, being so balanced, will greatly facilitate the motions to be imparted to the artificial arm.

Also, the combination of the expansion and contraction cords with the balance cord and spring with the hinged fore-arm, substantially as and for the purpose specified.

Also, the combination of the hinged hand, the turning wrist piece, the fore-arm, and the hinged connecting rod, substantially as and for the purpose specified.

Also, the hinged hand, the turning wrist piece, the fore-arm, and the hinged rod by which they are connected, substantially as specified, in combination with the means of connecting the said hinged rod with the fore-arm by a turning joint and spring, or equivalent adjustable connection, substantially as specified, so as to admit of turning the wrist, as set forth.

Also, the hinged fingers with the contraction cords and the spring with which the said cords are connected, substantially as described, whereby the fingers and, as an equivalent, the thumb can be contracted, as set forth, whether the said spring be located within the hand or on the arm, as set forth.

Also, the hinged fingers, the contracting cords and the spring connected therewith, in combination with the expansion finger cords, substantially as described, whereby the fingers can be opened or closed at the will of the person wearing the artificial hand, as set forth.

No. 46, 159.—THOMAS UREN, New York, N. Y.—*Artificial Arms and Hands*.—January 31, 1865.—This invention is explained by the claim.

Claim.—Combining the fore-arm, which is hinged at the elbow, to the upper artificial arm with a cord attached to the back of the fore-arm and below the elbow-joint, and which passes over a guide roller mounted in the fore-arm and near the lower part thereof, and thence through the back of the upper arm and attached to the strapping at or near the back, substantially as described, thus enabling me to produce an artificial arm for an upper amputation, which, by a single connection, will enable the person wearing it to move the arm at will, as described.

Also, the spring arm or lever which projects to the outside of the fore-arm, so as to be operated by bearing against any resisting object, substantially as described, in combination with the jointed fingers and the expansion and contraction cords, substantially as and for the purpose specified.

No. 46, 160.—ROBERT G. VASSAR, Poughkeepsie, N. Y.—*Blueing Paste*.—January 31, 1865.—This invention consists of a composition of bi-carbonate of soda, indigo paste, and acetic acid.

Claim.—The peculiar combination of the above ingredients, forming a more economical and perfect blueing than any now in use.

No. 46,161.—GEORGE W. WALKER, Lowell, Mass.—*Chest-expanding Suspenders*.—January 31, 1865.—The suspenders are perpendicular behind, reaching up nearly as high as the shoulders, where a transverse belt connects them, and is continued over each shoulder and thence down to the waistband in front. Another transverse belt connects the perpendicular parts behind midway between the upper belt and the waistband, and is continued under the arm to unite with the upper belt in front of the shoulder. The upper transverse belt is divided over the shoulder so as to permit the joint of the clavicle and the humerus to move freely within or beneath the opening thus formed.

Claim.—The openings V V, in the shoulder pieces D D, of chest-expanding suspenders when made and applied substantially as herein described and shown and for the purpose set forth.

No. 46,162.—JONATHAN WALTON, Brooklyn, N. Y.—*Making Corrugated Funnel Spout*.—January 31, 1865.—This invention consists in corrugating a piece of sheet metal of a suitable shape, bending it around a fluted tapering mandrel and then compressing the two between a pair of fluted or corrugated dies to give the spout the shape required.

Claim.—The process of making corrugated funnel spouts by first crimping the flat plate between corrugated plates E E, and afterward turning it around a longitudinally corrugated mandrel and pressing it thereon between corrugated dies, all as hereinbefore described.

No. 46,163.—JEFFERD L. WEAVER, Orange, Mass.—*Making Bonnet Binding*.—January 31, 1865.—This invention consists in weaving binding in strips of any desired length. The pieces forming the warp are selected of unequal lengths and new pieces added by adjusting the squared ends together and holding the newly added pieces in position by cords attached to them, which cords hold weights in suspense at their other ends, and thus keep the strips up to the desired places until made secure by the woof of the binding. This process is applicable to looms of any description adapted to weaving the material.

Claim.—The above described continuous bonnet binding, the same being produced by arranging the warps or strands alongside of and so as to lap by and on one another, as explained, holding each strand in place by means of strings and weights until woven into place, and finally connecting the warps by a filling or weft woven into them substantially as described.

No. 46,164.—HENRY WEBSTER, Beetown, Wis.—*Gang Plough*.—January 31, 1865.—This invention consists in placing one or more ploughs upon a jointed frame carried on wheels, and raised or lowered by means of a rack and pinion, and the ploughs guided to or from the land by a segment and pinion.

Claim.—First, the employment or use in a mounted gang plough of an oblique adjustable axle so arranged as to admit of the ready adjustment of the wheels for giving the ploughs more or less land, substantially as set forth.

Second, the frame H, applied to or connected with the draught pole A, by means of a joint in connection with the racks and toothed segments, when applied to gang ploughs, substantially as set forth.

No. 46,165.—THOMAS WELHAM, Washington, D. C.—*Steam Engine*.—January 31, 1865.—This invention consists in the use of two cylinders, having in each a right and left hand screw, so arranged that the threads meet in the centre, at which point the steam is admitted, and from which point it passes to either end of the cylinder, where it exhausts into the other cylinder, in which it returns to the centre, where an aperture is provided for its escape to the atmosphere. The screws are geared, and upon the shaft of one a pulley is placed for the purpose of transmitting power to any machinery to be driven.

Claim.—Placing one, two, or more right and left hand screws in the cylinders, as herein described, on the inside or outside of a steam or gas boiler, so as to receive and discharge the steam or gas, substantially as and for the purposes set forth.

No. 46,166.—THOMAS WELHAM, Washington, D. C.—*Universal Shafting*.—January 31, 1865.—This invention consists in a revolving shaft made of flexible material so as to operate in various positions or at any curve for the purpose of driving machinery of all kinds.

Claim.—A revolving shaft made of flexible material so as to operate in various positions or any curve, in the manner and for the purposes set forth.

No. 46,167.—THOMAS WELHAM, Washington, D. C.—*Hydraulic Brush*.—January 31, 1865.—This invention consists in the combination of a revolving brush with a water wheel attached to the nozzle of the hose, for washing windows, &c., the force of the water causing the wheel to revolve and spray the water through and around the brush.

Claim.—The arrangement and combination of the revolving brush and the revolving water wheel attached to the point of a water spout or hose, as herein described and for the purposes set forth.

No. 46,168.—H. W. WILCOX, Columbus, Penn.—*Folding Bucket*.—January 31, 1865.—The invention is fully set forth in the claim.

Claim—A folding pail or bucket composed of a rim constructed of a number of parts B, connected together by joints and having a flexible water-proof substance attached to them to form the body of the pail or bucket, and the rim having a jointed handle C attached, all constructed and arranged substantially as set forth.

No. 46,169.—DAVID WOLF, Lebanon, Penn.—*Reaping Machine*.—January 31, 1865.—This invention consists in constructing the hinged platform of the machine with a joint, or joints, in the length thereof, and parallel with the line of its hinged connection to the finger bar, in such manner that by springing the joint upward and suddenly returning it, so as to bring the parts of the platform again into line, the grain will be thrown from the platform upon the ground.

Claim.—A platform for reapers, composed of two or more parts connected by a joint or joints, and arranged to operate in the manner substantially as herein shown and described.

No. 46,170.—ALONZO WOOD, Henrietta, N. Y.—*Harvesters*.—January 31, 1865.—This invention relates to the arrangement of means for adjusting the height of the reel, while the machine is in motion, to adapt the same to the length of the straw upon which it is operating, as explained by the claim.

Claim.—Adjusting the reels of harvesters so as to adapt them to the inequalities of height of the straw in a field of grain by means of the arms G G, hand wheel N, chains or cords M M, or equivalent, and pawl lever P, the whole so arranged that the driver can operate the same without stopping the machine, substantially as herein set forth.

No. 46,171.—ENOS D. WOOD, Utica, N. Y.—*Steam Boilers*.—January 31, 1865.—This invention consists in providing within the ordinary steam dome of a boiler an additional dome or pipe, open at the bottom but closed at the top, and perforated throughout its length with small holes, through which the steam passes to the outer dome, from which it passes to the engine. The object of this inner dome, with its perforations, is to extract from the steam any water that may be held in suspension by it, and any foreign substances that may be carried up to it by the steam in consequence of priming in the boiler, or from any other cause.

Claim.—The domes A C, or their equivalent, constructed and arranged in combination, substantially as described, for the uses and purposes mentioned.

No. 46,172.—ABRAHAM WORMSER, New York, N. Y.—*Shirts*.—January 31, 1865.—The bosom being omitted in the construction of the shirt, a detachable bosom is made, with button holes around its edge or border, the shirt having corresponding buttons. The band attached to the bosom passes around the neck, and its two ends are buttoned to each other and to the shirt at the back of the neck.

Claim.—First, combining with a shirt made without a bosom a removable bosom attached around the edges to such shirt as specified.

Second, forming the neckband or band upon said bosom, to button or be attached to the shirt at the back of the neck, as set forth.

No. 46,173.—JOSEPH YATES, Mott Haven, N. Y.—*Low-water Detectors*.—January 31, 1865.—The object of this invention is to indicate in steam generators the height of water, and to give notice of its diminution to a dangerous extent, with unerring certainty. It consists also in the combination and arrangement of the float, chest, rod and lever, and also elastic diaphragm and lever.

Claim.—First, the combination and arrangement of the float D, the chest C, the rod E, lever F, and the rods H H, substantially as and for the purposes set forth.

Second, the elastic diaphragm or diaphragms I, in connection with the levers F, rods H H, and the lever G, substantially as and for the purpose specified.

No. 46,174.—SAMUEL K. ABBOT, Salem, N. H., assignor to JOEL D. CHAMPION, Nashua, N. H.—*Shoe Last*.—January 31, 1865.—The last is divided into two parts, the main last and the instep block, the latter of which is provided with a pin which fits into a corresponding hole in the former. The two ends of a bow spring are fastened to the main last, one on each side. In applying the instep block to the main last the spring is elongated by pressure until the block descends into its seat, when it returns by its elasticity to bind directly upon the heel of the block.

Claim.—The instep block fastener, composed of the bow spring *c* and the strap *d*, arranged with respect to one another and the remainder of the last, substantially in manner and so as to operate as described.

No. 46,175.—GEORGE N. BOLLES, assignor to S. W. WALKER & CO., Kalamazoo, Mich.—*Washing Machine*.—January 31, 1865.—This invention consists of an ordinary wash tub, set in a suitable frame and rotated by gearing, a follower being arranged in the tub, between which the clothes are placed.

Claim.—The rotating or reciprocating rotating tub G, in combination with the self-adjusting or rising and falling follower H, the guide bar J on the framing A, uprights I on the follower H, hinged bar K, and catch bar L, all arranged substantially as and for the purpose specified.

No. 46,176.—CHARLES F. BRAND, assignor to HARRIS BROTHERS & Co., Philadelphia, Penn.—*Ears for Paint Cans*.—January 31, 1865.—This invention consists in so constructing the ears of a paint can that they may serve as a slip to confine the top to its place.

Claim.—Combining the slips *a a* with the ears *D D* of paint cans, substantially in the manner and for the purpose above described.

No. 46,177.—W. H. BURRIDGE, Cleveland, Ohio, assignor to ADAMS, JEWETT & Co.—*Fruit Basket*.—January 31, 1865.—This invention consists in constructing the basket or bag of two pieces of paper, all the edges of which are straight, and the angles all right angles.

Claim.—The herein-described article, when made and formed substantially as and for the purposes set forth.

No. 46,178.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—*Harvester*.—January 31, 1865.—This invention will be understood by inspection of the claim and engraving.

Claim.—First, the combination of the girder slide pieces *a a'* with the end brackets *C C'*, and middle brackets *i2*, substantially in the manner described, for the purposes set forth.

Second, constructing the frame brackets *C C'* and *i2*, substantially as described, for the purpose of adapting them to either a right or left hand machine.

Third, constructing and arranging the sides *A A* of the frame, substantially in the manner described, so as to permit them to be reversed and shifted from one side to the other in order to change from a right to a left hand machine, or *vice versa*, as set forth.

Fourth, the combination of the trifurcated brace *R* with the inner shoe tongue and frame, substantially as and for the purpose described.

Fifth, the combination of the driver's seat and footboard pivoted on the post *U*, and connected by the rod *t* with the gauge bar *v*, as and for the purpose described.

No. 46,179.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—*Harvester*.—January 31, 1865.—This invention consists in mounting the crank shaft, which imparts motion to the cutters, in swivelling bearings and between the bars of the girder side beam in such a manner as that the frame shall protect the said shaft, while at the same time the twisting of the frame will not bind or strain the gearing. It further consists in a particular construction and arrangement of shell brackets for supporting and protecting the gearing, and also in the manner of combining the driving wheel and frame, whereby the teeth of said wheel are made to serve as a rack upon which to raise and lower the frame.

Claim.—First, mounting the crank shaft in swivelling bearings, substantially in the manner described, for the purpose set forth.

Second, the combination of the shell bracket *M* with the level wheel *N* and pinion *o*, as described, for the purpose of protecting the gearing.

Third, arranging the crank shaft between the frame timbers *a a* and within the bracket *C'* as and for the purpose described.

Fourth, mounting the counter shaft in the brackets *I M*, constructed in the manner described and for the purposes specified.

Fifth, the combination of the driving wheel, spur pinion, pinion shaft, and nut *J*, with the main frame, substantially in the manner described, for the purpose of raising the frame as described.

No. 46,180.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—*Harvester*.—January 31, 1865.—This invention relates to the particular manner of mounting the drive wheel in the frame, to the manner of combining the brackets which support and protect the gearing with the frame, and to the means of holding the frame at any desired elevation from the ground, as explained by the claim.

Claim.—First the combination of the driving wheel, tubular axle, sleeved radius bars, and main frame, substantially as and for the purposes described.

Second, the shell brackets *I I'*, constructed and combined substantially as and for the purpose as described.

Third, the combination of the shell brackets and main frame, substantially as and for the purpose set forth.

Fourth, the combination of the radius bars, shell brackets, and panels and ratchets, substantially as described, for the purpose of holding the frame at any desired elevation, as set forth.

No. 46,181.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—January 31, 1865.—*Harvester*.—A brief description of this invention other than that contained in the claim is impracticable.

Claim.—First, a vibrating slotted link or guide, which embraces the arm or stall of a vibrating sweep rake, and positively controls the movements of the rake, substantially in the manner and for the purpose described.

Second, the combination of an automatic rake with a vibrating slotted link or guide and gravitating stop latch, substantially in the manner described, for the purpose set forth.

Third, the combination of the rake arm with the swivelling socket or collar *f*, substantially as described, for the purpose of varying the angle of the rake teeth relatively to the platform, as specified.

Fourth, mounting a vibrating slotted link or guide, which positively controls the movements of an automatic rake, on an adjustable stud *g'*, as described, for the purpose of varying the path of the rake, as set forth.

Fifth, the combination of an automatic vibrating sweep rake, a vibrating guide, and a tension brake, for the purposes both of diminishing the force with which the rake strikes the gavel and of holding the rake down upon the gavel when raking off.

Sixth, driving an automatic rake through the centre of the driving wheel and from the outer side thereof, substantially as and for the purposes described.

Seventh, the combination of the pinions *d d1 d3 d4*, as described, for the purpose of varying the speed of the rake, as set forth.

Eighth, a tension brake to regulate the force with which an automatic vibrating sweep rake drops upon the platform.

No. 46,182.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—*Harvester*.—January 31, 1865.—This invention consists in combining a swan-shaped, vertical frame, of particular construction, with the horizontal frame, whereby a strong, rigid frame is secured, and at the same time one which can readily be raised or lowered without deranging the gearing.

Claim.—The combination with the horizontal main frame of a harvester of a swan-shaped vertical frame *C*, substantially in the manner described, for the purposes set forth.

No. 46,183.—WM. F. COCHRANE, assignor to himself and WARDER & CHILD, Springfield, Ohio.—*Harvester*.—January 31, 1865.—This invention relates to the particular arrangement of gearing for operating the rake, and to the manner of mounting the gearing in an independent, rigid frame or bed plate, which is so secured to the main frame as to admit of a ready removal or attachment of the same.

Claim.—First, the combination of the spur wheel *E*, idle wheel *F*, and pinion *G* with the crank shaft *G'*, substantially in the manner described, for the purpose set forth.

Second, mounting the rake gearing in the detachable frame or bed plate *H*, as described, for the purpose set forth.

No. 46,184.—CHARLES DEAVS, assignor to E. P. ARCHER and GEORGE PANCOAST, New York, N. Y.—*Portable Lanterns*.—January 31, 1865.—This invention consists in the combination of a tube, provided with a spring to receive a candle, with a case having a glass front, in such a manner that the tube may be shoved entirely within the case when the lantern is not in use, and so adjusted, by drawing out the tube, that it may serve as a handle when the lantern is in use. There is a cover over the glass, which protects it when not in use, and is capable of being raised so as to serve as a reflector when the lantern is in use.

Claim.—The combination of the candle tube *E* with the lantern case *A*, when the tube is arranged so as to slide within the case, and capable of being shoved entirely within it and drawn out wholly or partially from it, substantially as and for the purpose herein set forth.

No. 46,185.—ALEXANDER W. HALL, New York, N. Y., assignor to ALMON and ALBERT HALL, Columbus, Ohio.—*Churns*.—January 31, 1865.—The dasher in this churn is a fixture, and the body of the churn is caused to oscillate thereon.

Claim.—The fixed attachment of the dasher of a churn to a stationary support, and the suspension of the tub, box, barrel, or body of the churn in such relation to the stationary dasher that it and the contained milk may receive the necessary motion to produce the separation of the butter from the milk, substantially as herein described; or, in other words, a churn with a stationary dasher and a movable body, substantially as herein set forth.

No. 46,186.—PHILO W. HART, Stamford, N. Y., assignor to THE DALTON KNITTING MACHINE COMPANY, New York, N. Y.—*Stop-motion for Circular Knitting Machines*.—January 31, 1865.—This invention is designed as an improvement on Dalton's patent, No. 43,294. The object is to stop the machine when the yarn is nearly all run off the bobbin. Instead of a spring lever, held within a notch in the side of the bobbin, as in Dalton's machine, the inventor uses a slide, secured to a frame beneath the bed-plate, and a pin on this slide is held by the yarn within a notch on the bobbin. When the yarn is nearly all delivered, the pin is released by it, and the centrifugal force of the revolving bobbin stand throws the slide outward and brings a pin thereon into contact with an arm which, with its connections, shifts the belt from the fast to the loose pulley.

Claim.—The movable pin or piece *c*, in combination with the slide *I*, or its equivalent, attached to the bobbin stand, and with a groove or recess in the bobbin, substantially as and for the purpose herein specified.

No. 46,187.—STOUGHTON B. HOLDEN, assignor to himself and L. L. HOLDEN, Woburn, Mass.—*Combined Valise and Seat*.—January 31, 1865.—This invention relates to a combined valise and seat, whereby the valise, when unfolded, may be converted into a seat, with

room to receive and hold different tools or articles required for mechanics, artists, fishermen, &c.

Claim.—A combined valise and seat, composed of two parts *a a'*, connected by hinges *b*, one part *a* being provided with a bottom or seat *B*, and the other part with an internal lid *c*, and both parts supported by legs *D* when the device is used as a seat, the legs being removable, and all constructed and arranged as herein described.

No. 46,188.—W. A. HORRALL, assignor to himself and ALBERT W. CROSS, Washington, Ind.—*Brick Machines.*—January 31, 1865.—This invention consists in a mechanism which drives the moulds to the gear wheel on the pressure roller shaft, so that the mould and periphery of the pressure roller shall move in exact unison, by which the passage is facilitated and the clay evenly pressed.

Claim.—So connecting the mechanism which drives the moulds to the gear wheel on the pressure-roller shaft that the mould and periphery of the pressure roller shall move in exact unison, by which their passage is facilitated and the clay evenly pressed, substantially as herein described and represented.

No. 46,189.—JOHN W. HUSSEY, assignor to himself and GEO. H. QUINCY, Boston, Mass.—*Machinery for Oiling Wool in Carding Machines.*—January 31, 1865.—This invention consists in a scraper, in the form of an endless belt of slats, which lies beneath the burr box, and by its motion clears the pressure roller of any adhering fibre, while the top feed roller strips the band of any fibre adhering to it and conveys it to the card.

Claim.—First, in carding or other wool-preparing machinery, and in combination with the pressure roller of an oiling apparatus of otherwise ordinary or suitable construction, an independent scraper, or its equivalent, so arranged as to keep the pressure roller clear of the wool adhering to its surface.

Second, in combination with the pressure roller of an apparatus for oiling wool as it is fed to carding or other wool-preparing machinery, an endless apron interposed between the said pressure roller and the top feed roller, and moving in the direction of the said rollers, so that the surfaces in contact move in opposite directions, substantially in the manner and for the purposes set forth.

No. 46,190.—SAMUEL JOHNSTON, assignor to himself and RUFUS L. HOWARD, Buffalo, N. Y.—*Harvesters.*—January 31, 1865.—This invention relates to that class of machines which have the finger bar arranged opposite, or nearly opposite, the tread of the drive wheel, and the gearing located within the periphery of said wheel, and it consists in a particular construction and arrangement of the parts, as defined by the claim, whereby the gearing and cutting apparatus are readily raised and lowered together, while preserving the same relation to each other, and without interfering with the free working of the machine.

Claim.—First, constructing a harvesting machine, which I call the "Great Western," with the finger beam located opposite or nearly opposite to the tread, and the gearing located mainly within the periphery of the driving wheel, and with the finger beam and gearing so arranged that both can be raised and lowered together to any desired height, and still preserve the same relation to each other and the free working of the same, all constructed and arranged substantially as set forth and for the purposes described.

Second, the standard *m m*, located within the periphery of the driving wheel, the main plate *ll* and the perpendicular line shaft *e e* for supporting the finger beam and gearing and allowing them to be adjusted to the required height, arranged substantially as described and for the purposes set forth.

Third, the perpendicular grooved line shaft, in combination with the feathered clutch, and arranged and constructed as described for the purposes herein set forth.

No. 46,191.—HORACE K. JONES, assignor to THE HART MANUFACTURING COMPANY, Kensington, Conn.—*Machine for Indicating Carpenters' Squares.*—January 31, 1865.—This invention consists in attaching the graters to movable segmental plates or carriers fixed in the periphery of a revolving cylinder, beneath and parallel to the axis of which the blade to be marked is passed. The length of stroke of the graver is regulated by studs projecting from the periphery of the carrier plates coming in contact with an inclined surface of a guide bar, adjustable to or from the axis of said roller.

Claim.—First, the method, substantially as described, for cutting the division marks on carpenters' squares and rules.

Second, the toes *i* and yielding beds *D*, in combination with the graters *a*, applied and operating substantially as and for the purpose set forth.

Third, the screw clamps *g*, applied in combination with the graters *a*, substantially as herein specified, for the purpose of holding them in their places and to govern the depth of the cuts.

No. 46,192.—S. LOYD, assignor to himself and W. H. FREAR, Washington, D. C.—*Movable Calks and Toes for Horse Shoes.*—January 31, 1865.—These calks are formed with vertical flanges projecting from their upper surface, on both sides, the outer one having spurs

on top, turning inward to hook over the top of the shoe, the inner one having through it a pointed steel set screw, which being driven against causes an indentation in the shoe, and thereby clamps the calk tightly upon it.

Claim.—The calks B B', constructed in the manner herein described and represented, and employed in connection with the screws C C', in the manner and for the object specified.

No. 46,193.—BARNEY MCGINNIS, New York, N. Y., assignor to himself and REUBEN S. TORREY, Brooklyn, N. Y.—*Steam Generators.*—January 31, 1865.—This invention consists in arranging a system of high-pressure boilers in the interior of a double shell, which forms a low-pressure boiler, the two being connected together in such a manner that the inner or high-pressure one can be supplied with water from the outer or low-pressure ones. The two boilers, or system of boilers, have each an outlet pipe for steam, and the steam may be used to propel high and low-pressure engines, as it can be mingled, and all used in one engine.

Claim.—First, the system of high-pressure boilers B B', arranged in the interior of the shell or boiler *a*, in the manner and for the purpose substantially as herein shown and described.

Second, the back flue *c*, in combination with the double-walled shell *a* and return flue boilers B, constructed and operating substantially as and for the purpose set forth.

No. 46,194.—JOHN SHIM, assignor to himself and ISAAC STEAD; said STEAD assigns his right to NICHOLAS H. GRAHAM.—Philadelphia, Penn.—*Machinery for Oiling Wool in Carding Machines.*—January 31, 1865.—In this machine the oil rises in the wick by capillary attraction, and is held in suspension in the upper end of the wick, which hangs over a pipe, and may be heated if desired; the ridges of a fluted revolving roller press the ends of the wick gently and wipe out the oil; this roller then carries the oil to the surface of a plain roller, which transmits it by a gentle pressure to the wool upon the feed apron.

Claim.—In combination with a wool-oiling apparatus, raising oil from the tank by a wick or capillary attraction, for the above-described purpose.

No. 46,195.—JACOB WEBER, New York, N. Y., assignor to himself, WM. WHARTON, jr., Philadelphia, Pa., and IRA B. SNYDER, New York, N. Y.—*Knapsack.*—January 31, 1865.—This invention consists of a knapsack which is capable of being changed into a couch merely by opening it, being a light metallic frame or skeleton covered with water-proof material.

Claim.—First, constructing the frame of a knapsack with jointed and folding sides, connected to a central section C, substantially as above described.

Second, a knapsack which is capable of being turned into a couch, supporting the outer folding rails, both when it is extended and when it is folded up, by means of brackets found on the supports *c*, substantially as described.

Third, the combination with a folding knapsack, constructed substantially as above described, of a canopy and ribs *i*, as above set forth.

No. 46,196.—JEAN FRANÇOIS AUGUST AERTS and PAUL FRANÇOIS AERTS, assignors to JEAN FRANÇOIS AERTS, Antwerp, Belgium.—*Lubricator.*—January 31, 1865.—This invention consists of a lubricating box surrounding a journal, so constructed that no foreign substance, such as dust, ashes, &c., can penetrate from without, and no portion of the lubricating liquid can escape from within said box containing a reservoir of water, oil, or other liquid, which is conveyed to the rubbing surfaces by a peculiar arrangement of wheel and grooves.

Claim.—First, in combination a shaft or axle, a reservoir of water or lubricating liquids or mixtures thereof, a brass or bearing, so grooved or channelled, substantially as described, as to receive and carry water or fluid lubricating material to the rubbing surfaces, and a disk or wheel attached to and revolving with the shaft, so as to carry fluid lubricating material and supply to a brass, the combination operating substantially as set forth.

Second, in combination with an axle or shaft and a reservoir of water a channelled brass and a rotating disk and a close box, preventing the entrance of dust and the escape of water, and in which the joint between the box and the axle is closed by packing rings, applied substantially as described.

Third, in combination with a packing ring, making a joint with an axle, a concave or dishing protector attached to or making a part of a wheel or an axle, and acting substantially as described.

Fourth, in combination with a box and a reservoir of water a guard-plate or disk, making a partition between the front enclosure of the box and a water-lifting apparatus, substantially as described.

No. 46,197.—JOHN LYON FIELD, Lambeth, England.—*Manufacture of Moulded Candles.*—January 31, 1865.—This invention consists in making the lower end of a moulded candle of a tapering or conical form, so that it may fit various sized sockets of candlesticks without cutting or wrapping the candle.

Claim.—A moulded candle, the lower end of which is made of a tapering form, substantially as represented and described, for the purpose set forth.

No. 46,198.—JAMES WEBSTER, Birmingham, Eng.—*Manufacture of Zinc*.—Patented in England May 12, 1864.—This invention consists in passing zinc ore through molten iron. The zinc ore and nitrate of soda, in a finely divided state, are placed in a chamber situated above an ordinary cupola furnace, such as is used in smelting iron: from this chamber the zinc ore and nitrate of soda are conducted to another chamber by means of a channel, which is provided with a feed-screw at its lower end. The chamber contains the molten iron, and communicates with the interior of the furnace by means of a passage, and also communicates with a vessel containing water by means of a pipe. The molten iron passes under the inverted bridge and escapes, and the volatilized zinc passes through a tube into the water contained in the vessel.

Claim.—Extracting zinc from its ores by causing the latter to be brought into contact with molten iron or other metal in a close vessel.

No. 46,199.—THOMAS CROSSLEY, Bridgeport, Conn., assignor to THE AMERICAN WATER-PROOF CLOTH COMPANY, Brooklyn, N. Y.—*Flocked Cloth, Dyed or Printed*.—January 31, 1865.—The base is cotton, wool, silk, hemp, jute, or other material, coated with vulcanized or unvulcanized India-rubber by itself or in combination with lead, litharge, sulphur, or other material. The coating may also be gums, linseed, or other oils, varnishes, &c. The said base, after being thus coated, is covered with flocks or dust of wool, silk, cotton, fur, or other fibrous material.

Claim.—An article or fabric prepared, dyed, and printed, or either prepared, dyed, or printed, with a face of flocks of wool, silk, fur, or other material possessing the character and qualities herein set forth, as a new manufacture.

No. 46,200.—THOMAS CROSSLEY, Bridgeport, Conn., assignor to THE AMERICAN WATER-PROOF CLOTH COMPANY, Brooklyn, N. Y.—*Dyeing, Printing, and Manufacturing of Waterproof Cloth*.—January 31, 1865.—This invention consists of a new and improved manufacture, the result of the process of dyeing and printing, which is the subject of a patent to the inventor.

Claim.—The process, substantially as herein before described, of preparing, dyeing, and printing goods having a surface of flocks of the character herein before described.

No. 46,201.—EDGAR B. ADAMS, ROBT. P. TRIMBLE, and HORATIO N. ADAMS, Salem, Ohio.—*Rotary Engine*.—February 7, 1865.—This invention relates to a combination of parts, consisting of an annular case made steam-tight by heads which are bolted to the ends of a ring. Within this case is another annular ring, which has radial arms extending inwards to the hub through which the shaft passes. To these arms an eccentric is fixed, which works within an elongated yoke for giving motion to the pistons, which work through slots in the revolving ring, and are pressed out against the inner periphery of the case, except where they pass the abutment placed between the revolving ring and the case, when they are withdrawn by the eccentric arranged for that purpose. The steam is admitted near the abutment behind the piston, and forces it around nearly to the abutment again, when it is exhausted through apertures formed for that purpose.

Claim.—First, the combination of an eccentric hub D, having a groove *g* formed in it, with the revolving ring B, elongated yoke A, and sliding pistons *b b'*, operating substantially as described.

Second, the application of springs *s s'* to piston rods *e e'*, which are connected to a yoke E by means of pins *f f'* working in slots *i i*, substantially as described.

No. 46,202.—DAVID C. ALDRICH, Anamosa, Iowa.—*Churn*.—February 7, 1865.—This invention consists in the employment of two dashers, perforated partition plates, an air tube, and a water chamber, all arranged in such a manner as to cause butter to be rapidly produced in good condition, and to separate the butter from the buttermilk.

Claim.—The partition plates B B, perforated at their lower ends, and provided with an oblong opening *g*, in connection with the air tube H in the central compartment *e*, and the dashers D C in the compartments *d d*, all arranged to operate substantially as and for the purpose herein set forth.

Also, the concave surfaces *a** of the dashers, in connection with the upper inclined surfaces *b**, the perforated partition plates B B, and the air tube H, for the purpose specified.

Also, the water chamber *b*, in combination with the perforated partition plates B B, dashers C C, air tube H, and thermometer I, as and for the purpose set forth.

No. 46,203.—JOHN H. AMES, Baltimore, Md.—*Steam Boiler*.—February 7, 1865.—This invention relates to an arrangement of parts, by means of which a portion of the steam is suspended, and a portion used in its normal condition. It consists in the arrangement of an ordinary tubular boiler, with an additional number of tubes, a portion of which is submerged while the remaining portion pass through the steam space and superheat the steam in the portion of the boiler in which they are located. Two diaphragms are placed over the fire-box in such a manner that the steam generated in a portion of the boiler is to some extent separated from the superheated steam in the other portion, and a valve is placed in a pipe leading to

the main steam pipe to regulate the passage of the saturated steam on its way to the main pipe, where it mingles with the superheated steam.

Claim.—First, the arrangement of flues E' E', substantially as and for the purposes set forth.

Second, producing superheated and saturated steam in a boiler and separating these two forms of steam from each other without injuriously interrupting the water level, substantially as described.

Third, mixing together superheated and saturated steam in the steam pipe within the boiler, substantially as described.

No. 46,204.—PETER ANDREW, Cincinnati, Ohio.—*Machine for separating Grease, Lard, and Tallow from the refuse of Rendering Tanks.*—February 7, 1865.—This invention consists of a vat, provided with perforated steam pipes at its bottom and a perforated water pipe on one side at the top. Opposite this water pipe on the other side is a trough. Near the top of the vat is a screen made of separate frames and hinged together, each screen being covered with fine wire-cloth. The water and grease rise through the screen and flow into the trough, from whence they are conducted to the trap, where the water sinks to the bottom and rises again through the passages and overflows to the trough, when it is carried off by the pipe.

Claim.—First, the trap B, arranged as specified and shown, operating substantially in the manner described, for separating the grease from the water, and for the separation of liquids of unequal specific gravity.

Second, the use of wire-screens, substantially as described and set forth, for the separation of lard, tallow, or grease from the refuse or slush taken from steam-rendering tanks, and for the separation of any liquid having no affinity for water, and of less specific gravity, from any substance that is not liquid.

Third, the trough or gutter D, for the purpose of skimming the grease from the surface of the water in the vat, as specified and in the manner described.

Fourth, the perforated water pipe F, for the purpose of lifting the grease above the screens until it flows into the trough D, and for continuing the flow and driving it into the trough, substantially as described and shown.

Fifth, the bottom of the vat, formed and arranged as described and for the purpose set forth.

No. 46,205.—STEPHEN J. AUSTIN, Freeport, Me.—*Presses.*—February 7, 1865.—This invention consists of a press-box, one side of which is made movable, and is fitted in suitable grooves and connected by ropes to a windlass in such manner that by turning said windlass in one direction the movable side is thrown open and closed by turning the windlass in the opposite direction, the ropes being always taut.

The follower is operated by two levers, the inner ends of which are hinged thereto and connected to ropes or chains which extend over pulleys secured to the frame, thence down under pulleys near the inner end, and over pulleys in the outer ends of said levers, and to a windlass in such a manner that by the action of said ropes the levers are started from a horizontal position without requiring any attention from the operator. In order to take up the extra amount of chain, those used for operating the levers and followers extend over two drums geared together so as to rotate in opposite directions.

Claim.—First, the expanding press-box B, constructed substantially as and for the purpose described.

Second, the ropes or chains *d d' e*, pulleys *g g' h h' i m*, and windlass *j*, applied in combination with the movable side *a* of the press-box B, in the manner and for the purpose substantially as herein set forth.

Third, the pulleys *q q' r r' s s'* and *t t'* applied in combination with the chains *o o'*, levers D D', and follower C, in the manner and for the purpose substantially as shown and described.

Fourth, the double drums *u u'*, in combination with the chains *o o'*, levers D D', and follower C, applied and operating substantially as and for the purpose set forth.

No. 46,206.—JOHN M. BATCHELDER, Cambridge, Mass.—*Vessel for holding Petroleum.*—February 7, 1865.—This invention consists in applying to the inside of vessels for holding petroleum a paint consisting of a solution of gelatine and pulverized bone-dust boiled together.

Claim.—A barrel or other vessel having a lining or interior coat, formed substantially as herein described and for the purpose specified.

No. 46,207.—FORDYCE BEALS, New Haven, Conn.—*Carriage Retractor for Breech-loading Fire-arms.*—February 7, 1865.—The retractor is adapted to arms in which the barrel is moved forward from the breech, and consists of a spring dog, or hook pivoted to the stationary stock, so that on sliding the barrel forward the said hook not only retains the cartridge case against the stationary breech in connecting with a notch in the hammer, but by means of the spring causes the cartridge case to be thrown from the arm as soon as it is entirely withdrawn from the barrel.

Claim.—First, the hammer F, provided with the notch *l m*, in combination with the ejector G, when constructed and operating as herein set forth.

Second, the spring H, when constructed and arranged to operate in combination with the ejector G, as and for the purpose set forth.

No. 46,208.—E. B. BINGHAM, Newark, N. J.—*Process for Manufacturing Twine from Paper*.—February 7, 1865.—The claim defines the nature of this improvement. Shellac varnish, or shellac dissolved in alcohol, is used as a suitable sizing.

Claim.—In the manufacture of twine from paper, adding a water-proof sizing to the paper pulp, or applying the same to the paper while the latter is in a moist or green state, on the frame or web, previous to its passage through the final heated pressure cylinders, and previous to its being cut into strips and receiving its twist, as herein set forth.

No. 46,209.—CHARLES L. BISHOP.—Meriden, Conn.—*Moulders' Bench*.—February 7, 1865.—This invention consists of a bracket composed of an upright, a brace, and two horizontal arms, forming the platform or table, all of cast iron, and so constructed as to be readily taken apart and adjusted to suit the height of the workman using it.

Claim.—A moulders' bench, composed of a bracket A, ribs *a*, and cleats *d*, horizontal arms B, and brace C, all constructed and fitted together in the manner substantially as herein set forth.

No. 46,210.—ERASTUS BLAKESLEE, New Haven, Conn.—*Mess Kit*.—February 7, 1865.—This invention consists in fastening a frying pan to the bottom of a camp coffee-pot by passing the handle of the pan up through a hole made in the handle of the coffee-pot, and then catching it by passing the end of the bail through a hole in its upper end, for convenience of transportation.

Claim.—Attaching the pan to the kettle in the manner and for the purpose substantially as herein set forth and described.

No. 46,211.—JOHN M. BROWN, Portland, Maine.—*Tobacco Stopper*.—February 7, 1865.—A cover for the pipe bowl is provided with a hole in the centre and with spring arms fitted to shoulders to prevent the cover from slipping into the pipe. A stopper is attached to the lower end of a rod passing through the hole in the cover. Above the cover the rod is surrounded with a spiral spring, so that when the stopper is forced down on the tobacco in the bowl the spring may withdraw it.

Claim.—First, the pipe cover, perforated at the centre, and fitted with spring arms, having shoulders, substantially as and for the purposes described.

Second, the stopper or plunger, in combination with the rod and spiral spring, substantially as and for the purposes enumerated.

Third, the combination of the detachable cover, as described, with the spring stopper or plunger, as described.

No. 46,212.—MORGAN W. BROWN, New York, N. Y.—*Handle for Lamp Chimney*.—February 7, 1865.—This invention consists in the construction of separate handles, as an article of manufacture, to be attached to lamp chimneys or not, at pleasure.

Claim.—A metallic handle, formed as set forth, to clasp upon and be attached to an ordinary glass chimney, in the manner and for the purpose specified.

No. 46,213.—BENAJAH J. BURNETT, Mount Vernon, N. Y.—*Crane*.—February 7, 1865.—This invention relates to cranes in which the whole weight of the jib, with the body to be lifted, is received on the top of a supporting tower, around which the jib is capable of revolving. It consists in constructing said tower of cast iron; also, in a mode of supporting on the top of the tower the revolving cap or head from which the whole weight of the jib and its load is suspended; also, in a construction of what is termed the circular traveller, which revolves around the lower part of the tower and on which the weight of the jib is suspended from the revolving cap or head, and by which the horizontal thrust of the lower part of the jib is transmitted to the lower part of the tower.

Claim.—First, the cast-iron tower or column, of one or more pieces in height, with bottom flanges or base *a*, vertical cylindrical surface *d*, and shoulder *f*, all substantially as and for the purpose herein specified.

Second, the construction of the top of said tower, substantially as herein described, with a seat in its interior for the reception of the lower ring *i* of the box which contains the anti-friction balls upon which the cap or revolving head of the crane is supported.

Third, the cast-metal cap or revolving head C, provided with ribs or inverted brackets *k k*, for the reception of the sheave and tension bar pins *l m*, and central downwardly-projecting journal *p*, entering the box which receives the anti-friction balls upon which the said cap or head is supported, and receiving upon it the upper ring *i* of the said box, all substantially as herein specified.

Fourth, the annular box for the reception of the anti-friction balls which support the cap or revolving head C, constructed of two rings *i i*, the one forming the bottom and outer

sides of the box, fitted into a seat in the top of the tower or column, and the other forming the top and inner sides of the box, fitted to the journal of the cap or revolving head, substantially as described.

Fifth, the construction of the circular traveller B, with a flange for the reception of the suspending side branch rods, and with bearings for the reception of the jib shoes and counter-weight sills, so that each thrusts against the other, and a rolling joint is provided for the said shoes to permit the adjustment of the jib, all substantially as herein set forth.

Sixth, the branch side rods for suspending the circular traveller from the revolving head or cap, constructed with their upper parts single, as shown at G, and with their lower parts in two or more branches, as shown at *q q q* in figure 1, and combined with the cap or revolving head and traveller, substantially as herein described.

No. 46,214.—CHARLES W. CAHOON, Portland, Maine.—*Bottle for Oil*.—February 7, 1865.—This invention consists of a block of wood bored nearly through, with the shoulder near the top to support a stopper. The bottle is coated on the inside with a mixture of hot linseed oil and colophoney, or it may be coated with a solution of glue in water.

Claim.—First, a wooden bottle, made by boring a solid block of wood, and fitted with a stopper, rendered impenetrable to liquids, substantially as herein described.

Second, fastening a stopper into a bottle by means of a button, the ends of which fit into niches, substantially as described.

Third, a bottle having a shoulder and a flaring neck, in combination with a straight-side, uniform stopper, as herein described.

Fourth, a bottle fitted with channels, as herein described.

No. 46,215.—H. W. CATLIN, Burlington, Vt.—*Whip-socket Fastening*.—February 7, 1865.—This invention relates to a whip-socket fastening for vehicles. It consists in the employment of two washers, in the centre of which a screw passes, first through one of the washers, then through the dash board, then through the other washer, and is finally fixed in a socket.

Claim.—The washer B in combination with the screw C, passing through the dash D into the socket A, to be arranged substantially in the manner as and for the purpose set forth.

No. 46,216.—NORMAN CHAPPELL, East Avon, N. Y.—*Bean Harvester*.—February 7, 1865.—This invention relates to a machine for harvesting beans. Colters are attached to the frame in front of the cutters, which pass between the rows and separate the tops. The cutters pass under the ground two or three inches, thereby throwing the beans backward upon skeleton clearers of a conical form which are attached by links to the cutters.

Claim.—The clearer or clearers H, in combination with the cutter or cutters G, and a suitable frame A, arranged and operating substantially as herein set forth.

Also, in combination with the clearers H, cutters G, and frame A, the colters I, arranged and operating substantially as herein specified.

No. 46,217.—JOHN R. CROSS, Chicago, Ill.—*Packing for Oil Wells*.—February 7, 1865.—The object of this invention is to pack the space between the sides of the well and the pipe through which the oil is ejected, and thereby prevent water from passing to the oil below and admit of adjustment from outside of the well, so as to compress or relax the packing at pleasure, and enable the packing to be removed and adjusted at various points of the well without involving the loss or destruction of it. Its novelty consists in the arrangement of a fibrous or elastic substance in combination with rings, whereby, through the agency of screw rods, the rings are made to approach each other and the packing thereby be compressed so as to fill the space between the tube and sides of the well.

Claim.—The arrangement for artesian oil wells of a fibrous material D, consisting of hemp or other elastic substance, in combination with the rings A A', or other suitable frame therefor, so arranged that when said rings approach each other the packing material is compressed laterally, so as to fill the space between the tube and sides of the well, and relaxed when the rings are made to recede, the same being operated from the top of the well by the screw rods *d d*, substantially in the manner and for the purpose set forth.

Also, in combination with said packing device, the valve *f*, and tube *g*, operating in the manner and for the purpose herein set forth.

No. 46,218.—T. D. DAY, New York, N. Y.—*Ladies' Dress Protector*.—February 7, 1865.—This invention consists of a broad lining or facing of any suitable material, to be attached to the inside of the lower extremity of the skirt, which is first distended by spring wires or other suitable springs passing in and out in the direction of its width, the material being clamped at the end of the springs. Thus prepared, the facing is tacked in place.

Claim.—An interior lining or facing for the lower edge of the skirt of ladies' dresses or other garments, formed with springs introduced in the manner and for the purposes specified.

No. 46,219.—JOHN N. DENNISON, Newark, N. J.—*Fire Engine*.—February 7, 1865.—This invention consists in placing a valve in the partition between the pump cylinder, in such

a manner that when the valve is opened the two ends of the pump cylinder next the partition come in operation, the water passing from one to the other through the aperture closed by the valve, instead of being forced out by the cylinder into the delivery pipe. By this arrangement the effective area of the pump attached to steam engines is regulated according to the length of hose to be used, or the number of streams of water to be thrown.

Claim.—The increasing or diminishing the effective area of the pump or pumps by means of a valve placed in the partition between them, or other means, substantially the same as when attached to the steam fire-engines, so that the quantity of water discharged at a stroke can be increased or diminished at pleasure without altering speed or stroke, for the purposes herein set forth.

No. 46,220.—ARTHUR DE WITZLEBEN, Washington, D. C.—*Ball Screw for Fire-arms.*—February 7, 1865.—This invention relates to a bullet extractor, having two spring jaws with auger-like points, and the novelty consists in forming on the inside of the piercing points a projecting edge, or screw-like thread, for more effectually preventing the bullet from slipping from the grasp of the spring jaws in attempting to draw the same from the barrel of the fire-arm.

Claim.—The tines or jaws *b b*, with their threads or shoulders *a a*, forming in combination the concave screw for the uses and purposes as above described.

No. 46,221.—M. P. DORSCH, New York, N. Y.—*Paper-covered Wooden Boxes.*—February 7, 1865.—This invention consists of a round or oval box made of wood veneering, the side being lapped and glued, the bottom, when inserted, being held by a narrow strip of glued paper so laid along the angle on the outside as to be attached to both parts. The box is then covered with paper. The top is made in like manner, except that it is large enough to fit outside the upper part of the box.

Claim.—A box for collars and similar articles, made of a thin veneer of wood, with the top and bottom pieces secured to the sides by a strip of paper and other similar material glued around the said edges, and the box covered with paper, as specified, the whole forming a new article of manufacture.

No. 46,222.—JAMES B. EADS, St. Louis, Mo.—*Operating Guns in Turrets.*—February 7, 1865.—Guns with their carriages are mounted on a revolving platform, and are operated by a system of gearing, acting through the shaft on which the platform revolves, or acting concentrically therewith, whereby the guns are trained and operated, whether the platform revolves with the turret in which it is placed or independently of said turret.

Claim.—First, mounting a gun or guns upon a rotary platform, arranged to bring the muzzles of the guns to different ports in the turret or defence within which it rotates, when the power which operates the guns is communicated through devices acting concentrically with the axis of rotation of said platform.

Second, mounting guns on a rotating platform, which is arranged to rotate with a turret, when the power to operate the guns on said platform is conveyed to them through mechanical devices acting concentrically with the axis of said platform's rotation.

No. 46,223.—JAMES B. EADS, St. Louis, Mo.—*Operating Guns and Gun Turrets.*—February 7, 1865.—The platform on which the ordnance is mounted is arranged to be capable of rotating independently of the turret; and the power employed in training and deflecting the guns is transmitted through the pivot of the rotating platform, so that all the necessary adjustments may be made separately or together, as desired.

Claim.—First, the use of a rotating tower, in combination with a rotating gun platform, when each is arranged to rotate independently of the other.

Second, the combination in one turret of devices for training ordnance operated by means of power transmitted through the pivot or shaft of the platform on which the ordnance is mounted, with a rotating platform and a rotating tower, each arranged in such a manner that the training of the guns, the rotating of the platform and the revolving of the tower, may be performed independently of each other, substantially as described.

No. 46,224.—JOHN E. DOW, Boston, Mass.—*Bread and Meat Slicer.*—February 7, 1865.—This invention consists of a plate or gauge attached to a carving or table knife by a clamp and set screw, and so arranged that it may be adjusted to different thicknesses for slicing bread and meat.

Claim.—The application and arrangement of the slicer in the mode above described, or substantially the same.

No. 46,225.—WILLIAM H. ELLIOTT, Plattsburg, N. Y.—*Revolving Fire-arms.*—February 7, 1865.—This invention relates to the cylinder of a revolver, and consists in forming it in two sections by a dividing line passing through the series of chambers, but leaving the breech plate connected with the outer segment or annulus of the cylinder.

Claim.—First, dividing the cylinder *a* through its circle of chambers into two concentric parts, and having the recoil plate or breech permanently attached to the outer section, so that

the core or central portion may be drawn out in a forward direction, for the purpose of introducing the cartridges, substantially as herein described.

Second, charging the cylinder of a revolving pistol by first introducing the cartridges into the centre of it, and then by pushing them in a lateral direction to their places, as herein described.

No. 46,226.—CHARLES W. EMERY, Dorchester, Mass.—*Machine for Clipping Hair or Wool from Animals*.—February 7, 1865.—This invention consists in the employment of guards placed beneath a rotating cutter for the purpose of keeping the hair or wool erect while being cut.

Claim.—The upper guard *i*, for holding the hair or wool erect to facilitate the cutting, as herein set forth.

No. 46,227.—CHARLES ENGELSKIRKEN, Buffalo, N. Y.—*Lanterns*.—February 7, 1865.—This invention consists in an expanding and contracting button placed on the shaft for raising and lowering the wick tube of lanterns, and projecting through the case of the lantern, so as to be grasped and contracted within, when the lamp is to be removed.

Claim.—The expanding and contracting button *F*, constructed and operating for the purposes and substantially as described.

No. 46,228.—JOHN FARRELL, New York, N. Y.—*Fire-proof Safe*.—February 7, 1865.—This invention consists in making the filling for safes of Epsom salts alone, or combined with plaster of Paris or other suitable material—one part sulphate of magnesia to two parts of sulphate of lime.

Claim.—The employment of sulphate of magnesia in filling in the fire-proof chambers of safes, chests, and other like structures, when prepared and put in, substantially as and for the purpose specified.

No. 46,229.—H. E. FESSEL and F. KRAUTWADI, Chicago, Ill.—*Trip Hammer*.—February 7, 1865.—In this invention the hammer strap is drawn upward by means of two pulleys, which are brought together so as to compress the strap between them. One of these, the driving pulley, is fast upon its axle and turns in fixed bearings, while the other turns loosely upon an eccentrically journaled axis, arranged also in fixed bearings, but so as to be incapable of turning therein except as force is applied to it to effect that object. To one end of the latter shaft there is attached a horizontal arm, the outer end of which is connected to a hand lever or treadle by a connecting rod. By means of these appliances the eccentrically journaled shaft can be turned at will, so as to remove its roller from contact with the strap, and allow the hammer to fall through any length of spaced desired, within the limits of the machine.

Claim.—The combination and arrangement of the devices *e f g*, constituting both a tripping and adjusting contrivance, with the friction rollers *c c'*, crank shaft *E*, and hammer *F* *C*, in the manner and for the purpose described.

No. 46,230.—NATHANIEL C. FOWLER, Yarmouth, Mass.—*Combining Aluminum with Vulcanite and other Materials*.—February 7, 1865.—This invention consists in combining or mixing granulated aluminum with vulcanizable compound, and then vulcanizing in the usual manner; also in inlaying articles of vulcanite with aluminum, and also in joinings, clasps, &c., of rubber articles of aluminum; also in making tacks, nails, &c., for rubber shoes of aluminum. Heretofore only gold and platinum have been used in the manner proposed in this invention, since the sulphur in the vulcanite compound corrodes any of the other metals. This difficulty does not occur with aluminum, and it has the advantage over gold and silver in applications such as dental plates of great lightness.

Claim.—First, so combining granulated aluminum with vulcanite or rubber or analogous material, such as gutta-percha, forming a compound or composition of matter, substantially as described.

Second, the use of aluminum for the purpose of forming the joining of articles made of vulcanite, for attaching rubber or vulcanite to other material, and for inlaying and ornamenting articles of vulcanite.

Third, the use of vulcanite for the purpose of attaching articles made of aluminum to other materials, or to other articles made of aluminum.

Fourth, inlaying articles made of aluminum with vulcanite, and imitating articles made of aluminum by a clasp, rivet, or other fastening or ornamental device made of vulcanite.

No. 46,231.—THOMAS W. GOODWIN, Portsmouth, Va.—*Lubricator*.—February 7, 1865.—This invention consists of a tube descending from the flaring receptacle of oil, and receives a transverse cock plug which determines the course of the current by permitting it to flow in a straight line, or connecting the reservoir with the upper or lower portion of the pipe, at the direction of the operator; the plug having at its end a side perforation communicating with a central bore to the end for the escape of steam, when the cock is so set as to permit the influx of the oil.

Claim.—First, the arrangement, within a lubricator, of a single cock having three or more openings arranged in such a manner as to make an induction and eduction passage, when used as and for the purposes herein described.

Second, in combination with a lubricator, the mode of charging and discharging the reservoir, by means of a single cock arranged within a lubricator, when used substantially as described.

No. 46,232.—SOLOMON S. GREG, Boston, Mass.—*Ladies' Paper Collar.*—February 7, 1865.—This invention consists in the collar being fluted transversely and made gently contractile, except on about one-fifth its width along what is intended for the inner edge, where it is more rigidly crimped; it is thus made to assume and retain a circular form, having the rigid crimping at its inner periphery.

Claim.—As a new article of manufacture, a paper or cloth and paper collar, to which the requisite curve or shape is given by contracting one of its edges, substantially as described.

No. 46,233.—HOLMAN J. HALE, New York, N. Y.—*Tobacco Paper.*—February 7, 1865.—This invention consists in coating thin sheets of paper on one or both surfaces with fine particles of waste tobacco, by means of some adhesive substance.

Claim.—Tobacco paper made substantially as above described.

Also, the use of tobacco paper, made substantially as described, in the manufacture of tobacco cartridges and tobacco rettes made from said material, substantially as above set forth.

No. 46,234.—THOMAS HALL, Boston, Mass.—*Voltaic Soles.*—February 7, 1865.—The nature of this invention will be evident from the claim.

Claim.—The combination of the non-conducting sole or base with a series of alternate plates of dissimilar metals lapping upon each other, so that their points of contact may be kept bright by the friction caused by the motion of the foot, and allowing the moisture or perspiration of the foot to act upon both metals at the junction of the plates.

No. 46,235.—THOMAS GEORGE HAROLD, Brooklyn, N. Y.—*Wire Fork for Toasting, &c.*—February 7, 1865.—This invention consists in the construction of a toasting iron with one or two pieces of wire so coiled at the back end as to form a spring, which, operating on the jaws of the toaster by reverse action, draws them together and holds the bread or whatever is being toasted or broiled, the handles being twisted over each other so that one of them works in a slot guide on the other; a wire ring is also coiled around them at the point of crossing, to hold the jaws in place.

Claim.—First, constructing an apparatus for toasting, broiling, &c., of two clamps, pressed towards each other by a spring or springs, in substantially the manner described and shown.

Second, retaining the said clamps in correct position to each other by guides, in the manner and for the purpose specified.

Third, the combination of the clamps *a a'*, spring *b*, and guides *c* or *e*, for the purposes set forth.

No. 46,236.—THOMAS S. HUDSON, East Cambridge, Mass.—*Hanger for Lamps.*—February 7, 1865.—This invention consists in a lamp-support hanger, composed of a series of glass tubes, with end caps of metal strings, on a metal rod with an end of a metallic attachment.

Claim.—The lamp-support hanger, as composed of a series of glass tubes, the end caps or cups, the rod or its equivalent, and the end attachments, arranged relatively to one another, substantially as described.

No. 46,237.—JULIUS HORNIG, Oswego, N. Y.—*Shears for Cutting Metal.*—February 7, 1865.—This invention relates to a method of holding the free end of the lever of the shears up to, or connecting the same with, the eccentric which operates the shears, and also to the application of a washer to the hub or trunnion of the shears. The shear lever is connected to the eccentric by means of a strap guided in a groove on the eccentric, with which is combined a radial arm secured to the lever by means of a pin on which it is free to vibrate. The upper end of the shear lever is formed with a curved face and combined with an eccentric moving against its face, where it is held by means of a radial vibrating arm.

Claim.—First, the metal shears connecting the shear lever to the eccentric, by means of a strap guided in a groove on the eccentric, in combination with a radial arm secured to the lever by means of a pin *L*, on which it is free to vibrate, substantially as above described.

Second, also the curved face *d*, of the upper end of the shear lever, in combination with an eccentric against whose face it moves, and against which it is held by means of a radial vibrating arm *K*, substantially as described.

Third, also forming shoulders *s*, on the faces of the washers *O*, and shoulders *t*, on the faces of the bosses or projections *q*, in order to prevent the rotation of the washers during the vibrations of the lever, substantially as described.

No. 46,238.—WILLIAM S. HUDSON, Paterson, N. J.—*Device for Operating Safety Valves.*—February 7, 1865.—This invention consists of a spring, composed of steel, and constructed in the form of one-half of an elliptical spring, which is confined at its centre by a yoke, its

ends resting upon an eccentric roller or shaft, and a cross-bar rests upon two levers running parallel with the spring. The opposite end of the spring rests upon the eccentric roller in such a way that upon its being turned that end of the spring is raised and an additional amount of pressure is thrown upon the cross-bar at the opposite end, and through it upon the levers, which in turn communicate it to the bell cranks, which are operated by the rods extending up to the safety-valve levers. The novelty consists in the combination of the bell-crank levers with the eccentric shaft and lever with which it is manipulated in such a way that any pressure upon the safety valve which is sufficient to start it from its seat will continue its motion through its entire range, and thus prevent any increase of pressure in the boiler by providing an increased area for the escape of the steam.

Claim.—The bell-crank levers, in combination with the means L M, or their equivalents, for rapidly changing the initial tension of the spring I within wide limits, substantially as and for the purpose herein set forth.

No. 46,239.—HENRY HUNGERFORD, Brooklyn, N. Y.—*Key Fastener.*—February 7, 1865.—The key is provided with a hole in that part which enters the lock. The bolt of the lock is placed generally directly over the keyhole and key, and when the key is turned the end of the bolt, reduced for the purpose, enters the hole in the key and holds it so that it cannot be turned in or pushed out of the lock, neither can a tool be inserted to pick the lock.

Claim.—The combination and arrangement of the bolt C, constructed substantially as described, and its guide or case B, with the perforated key, the whole combined and operating substantially as and for the purposes set forth.

No. 46,240.—ANTHONY ISKE, Lancaster, Penn.—*Extension Table.*—February 7, 1865.—This invention consists in placing a central support beneath the table, when closed or extended, the whole forming an ornamental centre or extension table.

Claim.—The central column or support A, with its cross-pieces B C and slots *d*, in combination with the cross-slats *s* and their sliding pivots 2 3 4 and 5 in said slots *d d d d*, arranged and operating substantially in the manner and for the purpose specified.

No. 46,241.—HENRY JACKSON, Brooklyn, N. Y.—*Lock.*—February 7, 1865.—In this lock the stub, designed to enter the gates of the several tumblers after the latter shall have been properly set by the action of the key, is formed of two or more thin plates of unequal length, having a breadth sufficient to extend across the edge of the series of tumblers, and all hinged to one and the same pin. Each of the vibratory tumblers has its free end notched in the usual manner, and when force is improperly applied to the stub or to the bolt, for the purpose of compelling the stub to enter the gates of the tumblers, the sharp edges of the plates, constituting the stub, will catch into different notches in the ends of the tumblers, and, retaining their hold and moving as the tumblers move, will effectually prevent the proper arrangement of the gates and thus, of course, prevent the bolt from being retracted.

Claim.—The stub F, constructed as described of a plurality of movable plates *c c* of unequal length or projection, employed in combination with the tumblers E, in the manner and for the purpose specified.

No. 46,242.—C. JILLSON, Worcester, Mass.—*Machine for Pointing Wires in the Coil.*—February 7, 1865.—This device consists of a revolving mandril, supported on a suitable frame, and bearing a cross-head, to the face of which two cutters are attached, with their edges towards the centre and opposite each other, and between which the wire is passed for the purpose of reducing it to a uniform size. In a slot or longitudinal mortise within this cross-head, and behind the first set of cutters and attached to a bar sliding in said slot, are two more cutters, which reduce the point of the wire to its proper size, which latter, in passing inwards, presses against a spring rod sliding longitudinally in the mandril, and which carries, on an arm projecting through a slot in said mandril, a pattern, which, sliding at right angles with the cutter bar and across the cutter head, presses its inclined surface against a stud in said cutter bar, and forces the latter, with its cutters, outward from the centre, and gives to the wire, by said movement, a shape corresponding to the pattern.

Claim.—Combining the cutter head and pattern with a revolving shaft having a spring or yielding roll within it, as and for the purpose herein described and represented.

Also, in combination with a revolving cutter head and pattern, the extending of the cutter stock or cutters that are operated by said pattern clear through the cutter head, so that said cutters will not be thrown out or in anywise moved by the centrifugal force of the revolving head, substantially as described.

No. 46,243.—BENJAMIN F. JOSLYN, Stonington, Conn.—*Revolving Fire-arm.*—February 7, 1865.—This invention relates to a device for locking the cylinder immediately after each partial revolution thereof, and consists in the employment of a pin or bolt passing vertically downward through the top and rear portion of the frame into suitable recesses in a central projection at the rear of the cylinder, which is depressed by a spring on the top of the frame, and is raised by a slot in the nose of the hammer engaging with a small transverse spring pin passing through the said bolt, whereby the cylinder remains normally locked, except during the instant required for revolving the cylinder.

Claim.—The rod I and its transverse rod m, in combination with the recessed and inclined end of the hammer; the whole being arranged and operating for the locking and unlocking of the cylinder, substantially as and for the purpose herein set forth.

No. 46,244.—MORRIS L. KEEN and HUGH BURGESS, Rogers's Ford, Penn.—*Apparatus for Evaporating and Calcining Alkaline Solutions.*—February 7, 1865.—This invention consists in an apparatus for recovering alkali from the waste liquor of paper pulp. The heat after passing over the evaporating hearth is carried up into the chamber and over the surface of the alkaline solution in the pans. The alkaline solution is supplied to the upper pan from a reservoir, and flows from thence into the pan next below it, and so on until it reaches the hearth when it is ready for calcination. The calcination is effected in the furnace, which is constructed like the hearth of the evaporator.

Claim.—A furnace constructed for the purpose of evaporating the alkaline solutions used in the pulping and disintegrating of vegetable substances, in which the heat is utilized by means of an arrangement of pans or their equivalents, substantially as and for the purpose described.

Also, in combination with the main evaporator the finishing or calcining furnace or furnaces, substantially as described.

No. 46,245.—CHARLES KETCHAM, Penn Yan, N. Y.—*Corn Sheller.*—February 7, 1865; antedated January 29, 1865.—This invention consists of a series of guides and agitators for facilitating the passage of the ears into the body of the machine. Through the centre of the hopper passes a perpendicular shaft carrying a hollow metallic cylinder. This shaft works in a journal in the bed piece of the machine, and has a pulley outside for connecting with any power to be applied. This cylinder is surrounded by a series of concave plates, pivoted at top and bottom so as to swing outside by pressure of very large ears, and held in place by springs. The insides of these concave sections or plates are provided with rows of teeth. The interior cylinder, the surrounding plates, and bottom of the exterior casing are perforated with holes to facilitate the passage of the corn as fast as shelled.

Claim.—First, the cylinder H, when made as specified and used for the purpose set forth. Second, the concave when composed of the sections F, substantially as specified.

Third, the guides M, and agitators I, when constructed, arranged, and used as specified.

Fourth, encasing the concave, substantially as specified, and for the purposes set forth.

Fifth, the plates B and C, and hopper L, when constructed as specified, and used in combinations with the other parts of the machine as set forth.

No. 46,246.—HENRY KNIGHT, Brooklyn, N. Y.—*Topping Branch for Water and other Pipes.*—February 7, 1865.—This device consists of a cup or thimble, screw-threaded on the interior, and having a flange at bottom. This is inserted from the inside through a suitable hole in the sheet-iron shell of the pipe, and properly secured at the place desired; after which the cement lining is made in said pipe, surrounding the flange on the bottom of the cup. A hole can then be drilled through the bottom and a branch pipe attached in the usual way.

Claim.—As a new and improved article of manufacture the flanged cup A, having one end closed, and otherwise adapted to form connections for pipes.

No. 46, 247.—ANGELINA J. KNOX, Boston, Mass.—*Method of Preserving and Restoring Natural Flowers.*—February 7, 1865.—This invention consists in imbedding the flowers in sand, the large flowers being previously taken to pieces, and subjecting them to a temperature of 80° Fah., until all the water is expelled. If old and dried flowers are used they are soaked for a short time in warm water or alcohol, and then smoothed out with the fingers. After the flowers have been thus prepared they are coated with wax, such as is used in the manufacture of ordinary wax flowers, the large flowers which have been taken to pieces being put together in the same manner as in making artificial flowers.

Claim.—The process for restoring, treating, and preserving natural flowers, substantially as hereinbefore described.

No. 46,248.—JOHN P. LAIRD, Altoona, Penn.—*Car Bumper Attachment.*—February 7, 1865.—This invention relates to the guides for the bumper and bumper plates of railway cars, and consists in so embedding the said guides in packing blocks of wood that they can be formed much lighter and less expensive than ordinary guides, and at the same time are more capable of resisting the violent strains and shocks to which they are subjected; also, in a stoppage block for limiting and regulating the limit of the bumper plate to suit different styles of springs.

Claim.—First, the guide plates F, imbedded in the wooden blocks E E, and secured to the beams of the car, substantially as and for the purpose herein set forth.

Second, the stirrup N, confined between the beams E E, and secured to the bumper beams substantially as specified.

Third, the adjustable stopping blocks M, adapted to the plates F and G, and to a bolt b, which passes through the same, all substantially as set forth for the purpose specified.

No. 46,249.—JAMES A. LAWSON, Troy, N. Y.—*Ventilating and Check Draught Damper*.—February 7, 1865.—This invention consists of a vertical revolving damper around a stove or furnace pipe arranged before a horizontal damper placed in the exit pipe, and of less diameter than the exit pipe, and so constructed that when the vertical damper is open the horizontal damper is at right angles with the pipe.

Claim.—The employment of a horizontal damper in any stove or furnace exit-pipe, and of less diameter than such pipe, and above a vertical cylinder damper around such pipe, so as to more effectually check the draught by bringing the hot air within the said pipe in contact or conjunction with cold air admitted from room surrounding such pipe through said vertical cylinder damper, in the manner substantially as herein described and set forth.

Also, the combination of the vertical cylinder damper B², with the horizontal damper C, arranged immediately over the said vertical cylinder damper B², in the manner substantially as and for the purposes herein described and set forth.

No. 46,250.—JAMES A. LAWSON, Troy, N. Y.—*Heaters for Buildings*.—February 7, 1865; antedated November 15, 1864.—This invention consists in the arrangement of a return flue under the ash-pit of a heater of ordinary construction, in such manner that by a simple division plate in the flue or chamber the heat obtained from this source is economized and carried up into the flues leading into the apartments of the building.

Claim.—The employment of the return flue space or chamber G, in combination with the vertical pipes D and E, and with the fire chamber A, in the manner and for the purposes substantially as herein described and set forth.

No. 46,251.—ROBERT LEE, Cincinnati, Ohio.—*Shutter Hinge*.—February 7, 1865.—This invention consists in furnishing that part of the hinge attached to the window frame and surrounding the base of the pintle with a small spur flange or wheel, into the teeth of which can be made to catch a spring latch or pawl, fastened to the other part of the hinge, attached to and capable of being operated from the inside, and by means of which the shutter can be secured in any position desired.

Claim.—As a new article of manufacture the shutter hinge herein described, consisting of the parts A B, flange C, the radial notches *c c c*, gravitating catch D, fulcrum pin *d*, and hand lever E, all constructed, arranged, and operating as specified.

No. 46,252.—WILLIAM A. LIDTHALL, New York, N. Y.—*Feed-water Heaters for Steam Boilers*.—February 7, 1865.—This invention consists in arranging the heater in conjunction with the condenser, and placing them in such a position that the steam from the engine on its way to the condenser shall pass through the heater in order that a portion of its heat shall be abstracted therefrom and imparted to the feed-water. The steam thus reduced in temperature passes directly out of the heater and into the condenser, when the process of condensation is completed, and the water of condensation may be used for any purpose that is desirable.

Claim.—The heater I, arranged as described and placed between the exhaust of a steam engine and the condenser A, as and for the purpose set forth.

No. 46,253.—WILLIAM A. LIDTHALL, New York, N. Y.—*Condenser Case*.—February 7, 1865.—This invention consists in forming channels in the sides of the case for the reception of the tube sheets for the purpose of making available the room otherwise occupied by the flanges required for bolting such sheets to the case of the instrument. These channels are equal in width to the thickness of the tube sheets which are fitted to them, and are made tight with them, and when used the case can be entirely filled with tubes, leaving no more space between the tubes and case than is required for the circulation of the steam.

Claim.—The manner of constructing the sides A A', of the case, with the apertures *a*, combined with the manner of securing the tube sheets B B', and division plates D D, (or either of them,) in place, as herein set forth.

No. 46,254.—WILLIAM A. LIDTHALL, New York city.—*Condenser*.—February 7, 1865.—This invention consists in a partition placed in the chamber in which the cooling water is received, for the purpose of compelling such water to pass the tubes of the lower or cooling section of the condenser, and returning through the upper or condensing series of tubes; the object being to more thoroughly cool the condensed water than could be done if the cooling water entered both the condensing and cooling tubes at the same time. It further consists in the arrangement of the induction and eduction nozzle for the steam and water, and the division plates at one and the same end of the condenser, whereby the steam and water are each made to traverse the entire length of the instrument in opposite directions before being discharged therefrom.

Claim.—First, the combination of the division plate C' with the section of cooling tubes A, as and for the purpose set forth.

Second, the combination of the division plate C' with the tube sheet and cover to the end of the case (as shown,) for the purpose of dividing the space between the said tube sheet and cover into two sections as set forth.

Third, the arrangement of the cooling water-receiving nozzle B, the cooling water-delivery nozzle D, the steam nozzle E, the condensed water nozzle G, and the division plate C', placed at the same end of the apparatus as shown, and for the purposes set forth.

No. 46,255.—C. L. LOCHMAN, Carlisle, Pa.—*Funnel*.—February 7, 1865.—This invention consists of a double funnel, the liquid being caused to flow through the inner one and the air to escape between the two, a guide-rod descending to sustain a valve at the end of the funnel within the vessel, the funnel being closed by said rod in the act of lifting from the vessel; an escape tube permits the flow of the liquid to any desired point when it rises in the air passage.

Claim.—The valve or stopper *c*, with its handle and connecting rod *h* and *l*, or their equivalents, the elastic cone or washer, *g*, or its equivalent, the cock, *d*, and springs or catches, *m m*, constructed and connected substantially as and for the purposes specified.

No. 46,256.—JOSIAH LYMAN, Lenox, Mass.—*Draughting Scale*.—February 7, 1865.—This invention consists in having the edges of the rule or scale bevelled, and finished with minute divisions, or cuts, to serve as guides for the dotting pin, from the upper edge quite down to the paper.

Claim.—First, such an arrangement, application and graduation of the bevelled edge of the scale herein set forth as render it a universal reliable guide to the needle point in making a dot on the paper at the end of any required or given distance.

Second, the arrangement and application of the slide spring, as set forth, to the scale herein described, by which it is brought in contact with and becomes a part of the protracting trigonometrometer, or of a T square.

No. 46,257.—WALTER K. MARVIN, New York city.—*Hoisting Apparatus*.—February 7, 1865.—This invention has for its object the economical application to hoisting machines otherwise ordinarily constructed, of available power derived from some prime mover, thereby to save labor and expense.

Claim.—The method herein described of applying power to hoisting apparatus by the employment of friction pulleys operating by compression upon a rope or cable, or the equivalent therefor, substantially in the manner herein set forth.

No. 46,258.—P. J. MARQUA, Cincinnati, Ohio.—*Hobby-horse*.—February 7, 1865.—This invention consists of a rearing hobby-horse, made so that several children may ride at a time, each assisting to manage the horse by means of a balancing beam, which enables them to keep an equilibrium.

Claim.—First, the combination rearing hobby-horse A, vibrating beam B, seat I, and spring K, arranged and operating substantially as set forth.

Second, the slots G G', and the devices for the relative adjustment of the seat and horse, as explained.

Third, the arrangement of the rearing hobby-horse A, seat I, reins O O', and pulley T, adapted to operate as set forth.

Fourth, the India-rubber thong K, and clamp L L' M, arranged as set forth.

No. 46,259.—JOHN A. MILLER, Paducah, Ky.—*Breech-loading Ordnance*.—February 7, 1865.—A rotating breech-piece, or charge chamber, passes through a corresponding opening in the breech of the cannon. It contains two or more chambers—rotates laterally, having two legs which join below where it is pivoted. It is longer than the diameter of the gun, so that while one chamber is in line with the bore the other can be loaded. This rotating charge chamber is pivoted to a projection extending below the rear end of the gun.

Claim.—The shape and construction of the balance C, operating in a corresponding curved aperture E, in the breech of the gun, in combination with the support B, as herein described, for the purpose of firing cannon rapidly.

No. 46,260.—JONATHAN E. MORSE, Boston, Mass.—*Evaporator for Saccharine and other Liquids*.—February 7, 1865.—This invention consists in a series of three or more pans with hood-like covers. The pans are so arranged that the liquid may flow from one to the other by pipes. By means of a series of flues and dampers, the products of combustion from the furnaces are made to pass under each or all of the pans at pleasure. In the top there is an opening in the steam passage with perforations on the upper side. When steam is permitted to issue from these orifices the vapor is drawn off from the surface of the pans, and evaporation thereby increased.

Claim.—A train of evaporating pans with furnaces and flues arranged to operate in combination the few, substantially as described.

Also, the employment with an open evaporator of a cover and steam jets, when arranged to operate substantially as specified.

No. 46,261.—SAMUEL PENNOCK, Kennett Square, Penn.—*Machine for Bending Sheet Metal*.—February 7, 1865.—This invention consists in the construction and arrangement of the horizontally sliding bed plate, down upon the face of which the sheet of metal is bent by means of a hinged block or jaw in the usual manner. Thus each end of the bed plate is continued out beyond the frame and rounded so as to form journals, and the latter are connected by two stirrups to two eccentrics, arranged respectively in opposite ends of a shaft, by means of which the bed plate may be forced forward to press the sheet of metal up against

the stationary jaw. Two other eccentrics, operating from below, serve to elevate or depress the hinged edge of the bed plate, so that its upper surface may be adjusted in a horizontal plane or at different angles thereto. The sheet of metal to be bent is inserted in a vertical position between the edge of the bed plate and the stationary jaw, its lower edge resting upon adjustable gauges below, and after the bending has been effected the stirrups are slipped off the ends of the bed plate and the latter removed so as to release the bent sheet.

Claim.—First, the hinged removable and adjustable bed plate C, constructed and operating as described.

Second, in combination with the above, the mode described of adjusting the bed plate C horizontally by means of the eccentric G, arranged and operating as shown, or in an equivalent manner, for producing the same result.

Third, in a machine for bending metal constructed as described, adjusting the bed plate C vertically, by the employment of the eccentric R, arranged and operated as shown, or its equivalent, substantially in the manner specified.

No. 46,262.—JAMES L. PIKE, Lynn, Mass.—*Horseshoe Calk.*—February 7, 1865.—This invention consists in making of cast iron, chilled or otherwise, a calk with one or more dowel pins on the upper side, to enter corresponding holes in the shoe.

Claim.—As a new article of manufacture a horseshoe calk of chilled or "case-hardened" cast iron, constructed substantially as and for the object specified.

No. 46,263.—WILLIAM RADBOURNE, Rahway, N. J.—*Mangle.*—February 7, 1865.—This invention consists in a mangle, the lower roller of which has its bearings on friction rollers, while its upper roller is pressed down by the action of a semi-elliptical spring and thumb-screw.

Claim.—The application to a mangle of the semi-elliptical spring D, acting simultaneously on both boxes of the roller C, in combination with friction rollers e, supporting the gudgeons of the lower roller, constructed and operating substantially as and for the purpose set forth.

No. 46,264.—A. C. G. RATHBURNE and A. M. COMSTOCK, Lyme, Conn.—*Belt Coupling.*—February 7, 1865.—This invention consists in the use of a plate, provided with a slot, to admit the ends of the belt to be coupled, and with two toggle jaws, the latter being depressed, after the ends of the belt have been adjusted, clamp the same without the use of rivets or any other fastening.

Claim.—The plate A, provided with a slot a, and operating in combination with the toggle jaws B, substantially in the manner and for the purpose set forth.

No. 46,265.—ORRIN REEVE, Greenport, N. Y.—*Washing Machine.*—February 7, 1865.—This invention consists in combining with a tub, the inner ribs of which extend from the top to the bottom thereof, a rubbing board, a scoloped rim, and radially ribbed rubbers on its under side to act in conjunction with similar ribs on the bottom of the tub.

Claim.—In combination with a tub having ribs a on its inner perimeter, extending from the bottom to the top thereof, and radial flutes or ribs on its bottom, a rubbing board to act in conjunction therewith, having a scoloped perimeter and radial ribs on its under side, as and for the purpose herein described and represented.

No. 46,266.—J. J. RIDDLE, Cincinnati, Ohio.—*Vapor Lamp.*—February 7, 1865.—This invention consists in a combination of parts which can be understood only by a careful reference to the drawings and specifications.

Claim.—First, the use of the needle n, working through the burner and from the outside of the lamp into the valve d, in combination with the oil tube O, reservoir A, and air pump P, all constructed and operating in the manner and for the purpose substantially as herein shown and described.

Second, the valve S', applied in combination with the case t and air pump P, as specified.

Third, placing the valve seat d in the top of the burner, substantially as shown in figure 3, for the purposes set forth.

Fourth, the combination of the socket R', and pipe g'', with the oil tube O, needle n, valve seat d, air pump P, and reservoir A, constructed and operating in the manner and for the purpose herein specified.

No. 46,267.—T. J. ROQT, Galena, Ill.—*Trip-Hammer.*—February 7, 1865.—This device consists of a lever or hammer arm inserted in a rock shaft, from the opposite side of which projects another short arm coupled by a knuckle-joint to a vertical connecting rod, surrounded by a spiral spring, thrusting downwards. The lower end of this rod is connected to and operated by a treadle.

Claim.—The rock shaft B, with hammer rod C attached, in combination with the knuckle-jointed arm H I, provided with the spiral spring J and treadle F, all constructed and arranged to operate as and for the purpose herein set forth.

No. 46,268.—JAMES E. ROGERS, Chelsea, Mass.—*Machines for Jointing Oval Frames*.—February 7, 1865.—The object of this invention is to furnish a machine to be used on a bench for fitting the joints in an oval frame, and it consists in two tables or platforms provided with stops and adjustable rests so arranged as to give the proper adjustment to the frame, and that the angle of the joint will be the same on the parts that join together.

Claim.—As my invention, the jointing apparatus or machine, composed of the two platforms A B, the stops *b f*, and adjustable rests C D, arranged and constructed substantially in manner and so as to operate as and for the purpose specified.

No. 46,269.—LOUIS SAARBACH, Philadelphia, Penn.—*Tobacco Pipe*.—February 7, 1865.—This invention consists in the peculiar construction and arrangement of the curved tube, and the bulb or receptacle for the nicotine.

Claim.—The curved tube A, combined with the detachable bowl *c*, stem B, and reservoir D, as and for the purpose described.

No. 46,270.—LUCRETIA E. SALLEE, Decatur, Ill.—*Mode of Constructing Dolls' Heads and other Toys*.—February 7, 1865.—This invention consists in making dolls' heads of leather, strengthened by a composition plaster, glue, and vinegar, so as to render them lighter and less fragile than the ordinary articles of a similar nature.

Claim.—First, making dolls' heads and other toys of an outer covering of leather, or its equivalent, and an inner body of cement, which sets and hardens, so as to support the said covering in shape, substantially as above described.

Second, the cement or composition above described for making a body or backing to sustain the outer surface of the toy.

No. 46,271.—WILLIAM SAXTON, Venice, Mich.—*Seeding Machine*.—February 7, 1865.—In this machine the seed box is pivoted in such a manner to the main frame that by raising the forward end of the box the feeding device is thrown out of gear. The seeding device consists of a valve, worked by a cam on the inside of the wheels. Drag blocks are attached to the seeding box by links, and these are depressed or elevated by means of a cord or chain, and when in contact with the ground the drag blocks cover the seed.

Claim.—First, the pivoted seed-distributing plates H, arranged within the seed box D, in combination with the projections *d*, on the wheels B B, the springs *c*, on the adjustable seed-box D, all arranged substantially as and for the purpose herein set forth.

Second, the covers, J J, attached to the seed box by links K K, in connection with the cord or chain L, substantially as and for the purpose herein described.

No. 46,272.—JOHN F. SCHUFFENECKER, St. Louis, Mo.—*Brick Moulds*.—February 7, 1865.—This invention relates to a mode of operating brick moulds by means of a lever and rods, links, and axles.

Claim.—Operating the bottom of the moulds by means of the lever D, rods F and G, link I, and axles E E, for the purpose above specified.

No. 46,273.—JOHN F. SCHUFFENECKER, St. Louis, Mo.—*Machine for Making Bricks*.—February 7, 1865; antedated February 3, 1865.—This invention consists in the employment of a series of devices designated in the claim, and requiring a reference to the specification and drawings to be properly understood.

Claim.—First, the manner adopted by using the toe *j*, pan *i*, cup *k*, and tube *h*, in combination, for the purpose herein described.

Second, the scraper A, operated by the cams *i i*, fork lever *j*, and joint K, as for the purpose above described.

Third, the manner to secure the position of the scraper A, by means of the spring Z, and arm I, as shown in the specification.

Fourth, the manner adopted to regulate the friction of the machine by the cams *u u*, lever *f*, guide *g*, set screw *h*, in combination with the slot of the rod *x*, as shown and described in the foregoing specifications.

Fifth, the mode adopted to prevent the clay from settling between the hopper and the quadrant by means of the plate S, grooves R, steel bar *m*, and set screws Q Q Q Q, or their equivalents, for the purpose set forth.

No. 46,274.—THOMAS SHORT, Fairmount, Ill.—*Cultivator and Harrow*.—February 7, 1865.—In this machine the beams carrying the cultivator belts and reversible arms, carry also harrow teeth upon the upper side; a frame removable at pleasure couples together the beams at the rear end, and admits of adjustment to any width of the rows.

Claim.—First, the frames D D, provided with shovels E. and teeth F, the clevises *a d*, and screws or bolts *a'*, in combination with the adjusting frame G H, the latter permitting the cultivator frames to be operated simultaneously or independently, and adapting said frames when used as a harrow to be brought together at their rear ends, as herein specified.

Second, the combination of the treadles I, loops J, and connecting rods or wires *i*, for adjusting the frames D D, substantially as explained.

No. 46,275.—WILLIAM S. BATES, Westfield, Mass., and CATHARINE S. SMITH, Kingston, N. Y., executors of John Smith, deceased.—*Drying and Glazing Gunpowder*.—February 7, 1865.—This invention consists in drying and glazing the gunpowder at one operation. The barrels are secured around a revolving shaft, and are so arranged that a current of hot air may be caused to circulate through them. The powder is placed in these barrels through doors near each end. Steam, or hot water may be used when enclosed in pipes, instead of hot air.

Claim.—The application of heat to the cylinders or other vessel in which powder is glazed, while the process of drying is going on, for the purpose of glazing and drying the powder at one operation, substantially as above described.

Also, the method of carrying the same into operation by means of hot air and the apparatus above described, substantially as above set forth.

No. 46,276.—DANIEL E. SOMES, Washington, D. C.—*Buildings or Rooms for the Preservation of Food and for other purposes*.—February 7, 1865.—This invention consists in constructing the buildings with multiple walls, having intervening spaces. The cooling material, such as ice and salt, is placed in a separate apartment communicating with the chamber to be cooled, and so that the cooling material may entirely surround the said chamber or preserving room. For the purpose of ventilating the preserving chamber, tubes lead to the outside, and to cool the air entirely these tubes are made to pass through a cooling room, or through the cool spaces between the walls. When water pipes are used in the building the air tubes may be made to pass through the water pipes or through water tanks provided for the purpose. Instead of a single apartment, several, one within the other, may be constructed.

Claim.—First, the walls and chambers as described, in combination with the cooling and ventilating pipes, constructed and used as and for the purpose set forth.

Second, the series of rooms and buildings, substantially in the manner and for the purpose shown.

Third, the series of walls and chambers when used in combination with a process of rarefaction and ventilation and cooling appliances.

Fourth, cooling the air in buildings in which water tanks or pipes are used, by passing the air tubes or ducts through, in, between, or around the water-pipes or tanks.

No. 46,277.—DANIEL E. SOMES, Washington, D. C.—*Refrigerator for Preserving Articles of Food*.—February 7, 1865.—This invention consists in constructing refrigerators with a series of walls, floors, and roofs, with chambers between; the said walls, floors, &c., being made of wood, metal, or other suitable material, or one or more of them may be made of cork or glass. The inner chambers, and one or more of the others, are filled with salt and ice, or other freezing mixture. Air is supplied to the interior of the refrigerator by means of pipes communicating with the atmosphere at their upper ends, and with the interior of the refrigerator near the floor at their lower ends. The air is discharged from pipes, the inner ends of which communicate with the interior of the refrigerator above the inner ends of the supply pipes. The refrigerator is provided with doors, which are rendered air-tight when closed by means of India-rubber tubing, or its equivalent, placed around the joint.

Claim.—First, a refrigerator with multiple wall, and so constructed that the interior shall be separated from the cooling substance, thereby excluding dampness.

Second, the use of cork for the walls in the manner and for the purpose shown.

Third, the use of glass for the walls as and for the purpose set forth.

Fourth, the pipe larger at the bottom than top, substantially as described.

Fifth, the air-tight compartments substantially as and for the purpose shown.

Sixth, the vulcanized rubber tubing, or its equivalent, when used in the manner set forth.

Seventh, the vulcanized rubber tubing when applied to any door or drawer for a similar purpose.

No. 46,278.—J. M. STONE, North Andover, Mass.—*Eccentric adjustment*.—February 7, 1865.—Many instances occur where it is desirable to secure two or more eccentrics on the same shaft, and to have them capable of adjustment within the limits of the capacity given by their construction, without the employment of set screws and keys, or other devices which form projections, and are therefore liable to catch and tear objects with which they come in contact. The object of this invention is to reciprocate, to any desired amount, the rolls in such drawing frames as are shown in the patent No. 42,076, granted March 29, 1864, to Chase and Stone.

Claim.—For the purpose of adjusting the amount of throw of any of two or more eccentrics on the same shaft, the construction and arrangement operating substantially as described.

No. 46,279.—SAMUEL S. STONE, Troy, N. Y.—*Paper Collar Button-hole Punches*.—February 7, 1865.—This invention is explained by the claim.

Claim.—First, two oblong male end button-hole punchers L L, arranged lengthwise, or nearly so, to each other upon and adjustable longitudinally with two separate simultaneously reciprocating slides H H, in combination with two corresponding oblong female punch-

receiving dies N N, having like arrangement and longitudinal adjustment on a stationary bed, substantially as herein described.

Also, two oblong end button-hole punchers, adjustable axially on and longitudinally with two separate simultaneously reciprocating slides, in combination with two corresponding punch-receiving dies, having like axial and longitudinal adjustment on a stationary bed, substantially as herein described.

Also, two oblong end button-hole punchers L L, arranged lengthwise, or nearly so, to each other, and a central one M, arranged crosswise thereto, on separate simultaneously reciprocating slides H H and I, and with the central punch and slide adjustable transversely to the end one, in combination with two corresponding punch-receiving end dies N N and a transversely adjustable central one o on a stationary bed, substantially as herein described.

Also, two oblong end button-hole punchers arranged lengthwise, or nearly so, to each other, and a central one placed crosswise thereto, on separate reciprocating slides, and with the end punchers and their slides adjustable longitudinally, in combination with corresponding central and longitudinally adjustable end punch-receiving dies on a stationary bed, substantially as herein described.

Also, two oblong end button-hole punchers arranged lengthwise, or nearly so, to each other, and a central one placed crosswise thereto, on separate simultaneously reciprocating slides, with the end punches and their sides adjustable longitudinally and the central ones transversely, in combination with corresponding longitudinally adjustable punch-receiving end dies, and a transversely adjustable central one on a stationary bed, substantially as herein described.

Also, a central oblong button-hole punch and two axially adjustable end ones, on separate simultaneously reciprocating slides, with the end punches and slides adjustable longitudinally and the central ones transversely, in combination with corresponding axially and longitudinally adjustable end punch-receiving dies, and a transversely adjustable central one on a stationary bed, substantially as herein described.

Also, two oblong button-hole punches and a central one, all adjustable axially on separate simultaneously reciprocating slides, with the end punches and slides adjustable longitudinally and the central ones transversely, in combination with corresponding axially and longitudinally adjustable end punch-receiving dies, and a transversely and axially adjustable central one on a stationary bed, substantially as herein described.

Also, the arrangement of adjustable guides d, in combination with end or end and central button-hole punchers, arranged on and adjustable laterally with separate simultaneously reciprocating slides, and working into corresponding adjustable punch-receiving dies on a fixed bed plate, substantially as and for the purpose herein set forth.

No. 46,280.—JOHN B. TERRY, Anburndale, Mass.—*Apparatus for Carburetting Oil*.—February 7, 1865.—This invention consists of two vessels connected together by means of a pipe, and provided with bell covers, which dip into annular channels filled with water. The air enters into a casing within one of the vessels, and is forced under the water contained in it by means of scoops which are attached to a vibrating shaft. The air as it escapes from the water rises to the top of the vessel into the bell cover. It is conveyed thence to the carburetting vessel by means of a tube, said tube being connected with a hollow rotary shaft, provided with hollow perforated arms at the lower end beneath the hydrocarbon liquid, so that the air as it escapes passes up through the hydrocarbon. The carburetting vessel is provided with a rotary shaft, to which is attached agitating arms, the ends of which have attached to them pieces of sponge, or similar material.

Claim.—The combination of one or more air cells and vibratory scoops or buckets, applied together and within the cistern A, substantially in the manner and so as to operate therewith as described.

Also, the combination of the "Barker's mill," or rotary air and agitating distributor K, with the vaporizing cistern B, the cistern A and its air-forcing apparatus.

Also, the combination and arrangement of the shaft F, its arms and sponges, or their equivalents, with the agitating and air distributor K, the cisterns A B, and the air-forcing apparatus of the cistern A.

Also, the combination of the friction brake apparatus, consisting of the lever W, the constructing rod Y, the arm z, the screw shaft a', and the stud b, or its equivalent, for the purpose set forth, with the air-forcing apparatus and the vaporizing cistern B, provided with the bell c, to operate as specified.

Also, the said friction apparatus, constructed substantially as described, as well as its arrangement with respect to the bell c and the vibratory sector, as specified.

No. 46,281.—JOSEPH S. TRUE, Garland, Maine.—*Machine for Planting Potatoes*.—February 7, 1865.—This invention consists of a rectangular frame, with the front end mounted on two wheels, and the rear end on a roller. Upon this frame is a hopper, underneath which are two boxes or cells into which the potatoes fall. At one end of the cells is a stationary knife, and in this cell is a head or piston, driven by suitable gears, which in its movement forces the potatoes against the knife, when they are cut, and the piece falls through an opening and is conducted to the ground.

Claim.—First, a reciprocating slide, provided with one or two boxes, and arranged in relation with bottom plates, one or more to operate in the manner substantially as and for the purpose herein set forth.

Second, a horizontal stationary cutter or knife, arranged with a reciprocating slide and boxes to operate substantially as and for the purpose specified.

Third, the placing of the cutter or knife in such a relative position with the sliding boxes that the latter will feed or convey the potatoes to the former, both above and below it, as set forth.

Fourth, the furrow share F at the bottom of the seed-conveying tube F, the covering shares G G, and roller I, when used in combination with the potato-dropping device, substantially as and for the purpose set forth.

No. 46,252.—CHARLES T. WAKELEY, Madison, Wis.—*Bill Holder.*—February 7, 1865.—This invention consists of a peculiar way of adjusting the straps and bands, so as to vary the thickness and elasticity, &c.

Claim.—The hasps or fasteners C and D, in combination with the straps and bands I and H, adjustable in the manner and for the purposes shown and described.

No. 46,253.—FREDERICK A. WEBER and WILLIAM H. GREENE, Woonsocket, R. I.—*Soda-water Apparatus.*—February 7, 1865.—This invention consists of a chest containing the sirup vessels and valve case. Into this valve case the pipes from the sirup vessel and the pipe from the soda fountain extend, it being connected to the draught tube. The valve case is constructed with a series of valves, one for each sirup pipe, the said valves being operated by rods, and it is also provided with a valve for the soda tube, which is operated by the rod.

Claim.—The valve case *d*, when arranged within the box *a* and with the system of sirup pipes *i*, fountain pipe *e*, and outlet pipe *f* connecting therewith, the valves in the sirup and fountain pipes being operated by a system of levers and valve rods, and the whole constructed and arranged substantially as shown.

No. 46,254.—FREDERICK A. WEBER and WILLIAM A. GREENE, Woonsocket, R. I.—*Draught Tube for Soda-water Apparatus.*—February 7, 1865.—This invention consists of a casing, within which is a tube *b*, the same tube being a continuation of a tube *c*. The internal diameter of the tube *b* is decreased at its lower end, forming a passage *d*. Just above this passage are two lateral orifices, which are controlled by a gate that encircles the tube *b*, the said tube being connected with a stem and handle.

Claim.—The construction of a draught tube for soda-water apparatus, with an inner tube *b*, having an outlet *d* and lateral orifices *e*, opening into the tube *a* and controlled by a gate *f*, the whole being constructed and arranged to operate substantially as set forth.

No. 46,255.—WILLIAM S. WEIR, Jr., Monmouth, Ill.—*Corn Plough.*—February 7, 1865.—This invention consists in a mode of fastening up the rear end of the plough beams when not in use. The beams are hung over hooks at the end of two pivoted rods, whose interior ends pass through a staple on a lever jointed to the rear of the draught pole. As the lever is raised the plough beams drop to the ground.

Claim.—The curved rods M attached to the back end of the bars *d d*, and bent in the form of hooks *k* at their lower ends, in connection with the lever *o* attached to the back end of the draught pole C, all being arranged and applied substantially as and for the purposes specified.

No. 46,256.—HENRY F. WHEELER, Boston, Mass.—*Magazine Breech-loading Fire-arms.*—February 7, 1865.—The barrel is surrounded by a tube in which it slides longitudinally, and when in its forward position receives the charge from an oscillating magazine in the stock. By the movement of the trigger the magazine is turned down, and the barrel flies back under the operation of a spring against the breech piece, which also oscillates during the loading and firing process. The charge is fired by the action of the barrel in being thrown back against the breech piece.

Claim.—A fire-arm having a sliding barrel, the charge of which, inserted at the breech, is fired by driving back the barrel against a percussion or breech block.

Also, the swinging breech or percussion block, constructed and arranged to operate with respect to the barrel and the magazine or cartridge tube, substantially as set forth.

Also, the magazine or cartridge tube, when arranged to connect with and be disconnected from the barrel, substantially as set forth.

Also, holding the barrel in forward position, or the arm cocked, by the employment of the forward end of the magazine tube, substantially as described.

Also, the arrangement of the breech or percussion block to swing above the path of movement of the cartridge tube, to permit the connection of the cartridge tube and barrel and the cocking of the piece.

Also, the arrangement of the cartridge tube, to allow of its movement to permit the descent into place of the breech block, and the spring movement of the barrel.

Also, the manner of withdrawing and expelling the shell of the exploded cartridge by de-

taining it upon the cartridge tube or breech block, and throwing it therefrom, substantially as set forth.

Also, producing the forward movement of the barrel and the downward movement of the cartridge tube by the direct action of the trigger lever, substantially as set forth.

Also, the arrangement of a barrel within a case or cylinder containing the spring, by which the rear or percussion movement of the barrel is produced.

Also, so combining the magazine tube and percussion block that they move together or as one piece, substantially as set forth.

No. 46,287.—GEORGE W. WHITE, New York, N. Y.—*Apparatus for Calcining Ores*.—February 7, 1865.—This invention consists of a furnace and cylinder, which latter is supported on rollers, and is lined with fire brick. It is also provided with passages containing the ore to be calcined, the said passages being designed to conduct the products of combustion from the furnace. The passages are grooved from end to end, and the ore is supplied to the same by means of a hopper, the supply being regulated by means of the feed device, and escapes through into the trough, from which it is washed by a stream of water. Near the top of the smoke stack is a coil of perforated pipe, so arranged that water may be forced through it horizontally in every direction, so as to stop the fine particles of ore as they escape and carry them down to the compartment where they may be collected.

Claim.—First, the combination in the rotating cylinder of separate combustion and calcining flues or passages, substantially as and for the purposes herein specified.

Second, the furnace located at the opposite end of the rotating cylinder to that at which the ore or other substance to be calcined enters, substantially as and for the purpose herein set forth.

Third, so combining the calcining flues or passages of the rotating cylinder with the furnace that the gases eliminated from the ore or other substance in the said passages may enter into combustion in the furnace, substantially as and for the purposes specified.

Fourth, in a rotating cylinder, with separate combustion and calcining flues or passages combined with a furnace, as described, constructing the inner surfaces of the separate calcining passages with grooves, cavities, or projections, substantially as and for the purpose herein specified.

Fifth, the coiled perforated water pipe *f* placed in the smoke-stack or vertical flue, in combination with the rotating cylinder, substantially as and for the purpose herein specified.

No. 46,288.—FREDERICK WOOD, Somerville, Mass.—*Clasps for Wearing Apparel*.—February 7, 1865.—A convex disk is riveted to the cloth. One side of the periphery thereof is notched down nearly to the bottom of such cup or concavity; the opposite side thereof has a lateral slot at its centre. A bar carrying a disk at one end and another disk near the other end, is riveted to the cloth by the first disk, the other disk fitting into the concavity of the independent disk first described, the extremity of the bar passing through the slot described, the bar between the two disks, descending into the notch.

Claim.—The improved fastener, as composed of two parts, A B, made substantially as described.

No. 46,289.—RUFUS WRIGHT, New York, N. Y.—*Pencil Sharpener*.—February 7, 1865. This device consists of a single piece of steel, of such a form that, when folded, it has a spiral cutter for the wood, a guard piece, and filing groove for pointing the lead.

Claim.—First, the spiral and tapering cutter A, constructed in the manner and employed for the purpose herein specified.

Second, the guard B, formed in one piece, with the cutter, A, and employed to protect the same, and as a protection from the same, as set forth.

Third, in combination with a guard B, constructed as herein described, the angular groove O', for pointing the lead.

No. 46,290.—THOMAS C. BALL, assignor to LEWIS GRAHAM, HENRY HARLOW, and A. G. WASHBURN, Springfield, Vt., and said HENRY HARLOW and A. L. THOMPSON, administrator of the estate of Lewis Graham, assignors to A. G. WASHBURN.—*Mop Holder*.—February 7, 1865; antedated February 14, 1863.—Within a tubular case, mounted on a suitable handle, is a series of curved springs, arranged so as to retain the cloth of the mop within the case, and adapt themselves to varying thicknesses of cloth.

Claim.—The combination and arrangement of curved springs *a a a a*, substantially as described with the slotted head B, as set forth.

No. 46,291.—WILLIAM S. BELL, assignor to himself and W. S. BELL, JR., Boston, Mass.—*Forming Paper Collars*.—February 7, 1865.—The collar is pressed, preparatory to folding, upon a bed having a slot therein on the line to be folded. Within this slot, and descending into a vessel of water beneath, is a suitable piece of cloth by which the collar is dampened when pressed upon the slotted bed.

Claim.—The improved method of treating paper collars or collar blanks, to define and determine the line of fold, substantially as set forth.

No. 46,292.—HIRAM BERDAN, assignor to LEVI P. MORTON, trustee of HIRAM BERDAN, ABRAHAM A. SELOVER, and WILLIAM B. BENSON, Boston, Mass.—*Cartridges for Breach-loading Rifled Fire-arms*.—February 7, 1865.—The rifling of the barrel being extended through the counter bore, the cartridge case is so formed as to fit the grooves and present the projectiles in proper position to go through the bore, the faces of one being coincident with those of the other; much friction and upsetting being thus avoided. The interior faces of the cartridge must coincide with those of the bore proper.

Claim.—An indestructible cartridge case, with an irregular exterior to correspond with the counter bore with which it is to be used, and a rifled interior, to correspond in size and form with the bore proper, in combination with one or more projectiles previously prepared to fit the rifling of the bore, the whole constructed and arranged substantially as herein described, so that the chamber will be protected from fouling, and the balls properly located in respect to the rifling of the bore, without the necessity of their entering the latter in the act of loading.

No. 46,293.—ABIJAH E. and JOSIAH B. BLOOD, assignors to themselves and WILLIAM J. and BENJAMIN F. LARABEE, Lynn, Mass.—*Coal and Ash Sifter*.—February 7, 1865.—This invention consists of a sieve set in a circular box of sheet metal, provided with a cover, said sieve being convex, or having its middle portion slightly raised, so as to break up in sifting what is called the dead centre, and to force all the coal, &c., to the outside edges, where it can be thoroughly sifted; it is placed over a receptacle for ashes, and when used a rotary motion is imparted to the apparatus by a handle on the outside.

Claim.—First, the construction of coal sifters with a vibratory bottom C C, separate from the enclosing case B B A A, carrying the screen D, or wire cloth E, with free movement independently of the stationary case.

Second, the construction of the vibratory bottom or screen E with a decided convexity upward.

Third, the combination of the case A A B B with the cross-bar Q fastened thereto, the operating rod D, and the independent convex screen E, substantially as described and for the purpose set forth.

No. 46,294.—SETH BORDEN, assignor to HENRY H. JACQUES, Newark, N. J.—*Picking Cylinders of Machines for Disintegrating Fibrous Materials*.—February 7, 1865.—This invention consists in a spiked wooden cylinder, which revolves at a very high velocity, and is spirally wound with a strand or strands of wire, for the purpose of strengthening the cylinder, and enabling it to run with safety at much higher than ordinary velocities without the danger of flying to pieces by centrifugal force.

Claim.—Binding the picker cylinders of pickers for disintegrating fibrous materials, as and for the purpose described.

No. 46,295.—ANTHONY CLARK, assignor to himself and GORHAM BLAKE, Todd's Valley, Cal.—*Flexible Pipe for Mining*.—February 7, 1865.—This invention consists of a conduit made in sections of thin sheet-iron pipes, connected together by means of strips of canvas or other material wound round the ends of the pipes, and confined thereon by means of clamps. Each section is provided with an aperture, closed by a valve opening inward to prevent the pipe from collapsing when the water is shut off.

Claim.—The improved flexible conduit, made as described, viz., of metallic pipes, cloth connections, clamping rings, valves and valve openings, constructed and arranged together substantially as represented and explained.

No. 46,296.—G. F. J. COLBURN, Newark, N. J.—*Coat and Hat Rack*.—February 7, 1867.—A T-shaped contrivance is attached to a coat and hat hook, and a U-shaped groove is formed in a rail or slip of wood. The hook can be readily attached to the rail by placing the T-shaped projection within the U-shaped groove, and the hook can be slid forward or backward at pleasure. When it is desired to make the rack thus constructed portable, a device is attached to the rail, by means of which it may be attached to or taken from a wall at pleasure.

Claim.—The combination of the hook C, bar or strip A, attachments D D, constructed, arranged, and applied in the manner and for the purpose set forth.

No. 46,297.—JOHN N. DENNISON, assignor to himself and GOULD BROTHERS, Newark, N. J.—*Rivets*.—February 7, 1865.—This invention consists in forming the head and washer with a projecting edge which, when pressed into the material riveted, takes hold of a much larger portion of the latter than is usually done by a mere shank.

Claim.—A rivet or a washer with a projecting edge, constructed in the manner and for the purpose herein above specified.

No. 46,298.—THEOPHILUS HILTON, Providence, R. I., assignor to himself and WM. D. HILTON, Cranston, R. I.—*Tree Protectors*.—February 7, 1865.—In this device the trough that surrounds the tree is made as usual, the hood being so constructed that it wholly covers the trough, and can be put around the tree and secured without the use of solder or screw bolts, and may also be removed at pleasure without injury.

Claim.—First, the hood C, for the tree protector, composed of the flanch *b*, rod *c*, and lip *a*, and united by means of a clasp *e*, the whole constructed substantially as described.

Second, the construction of a hood, as described, or its equivalent, with a trough, or its equivalent, encircling the trunk of a tree, substantially as and for the purpose specified.

No. 46,299.—JOSEPH B. JOHNSON, assignor to himself and CHARLES BUFFUM, Lynn, Mass.—*Shoes.*—February 7, 1865.—This invention consists in the employment of a false inner sole, in connection with the last and upper; in the combination of pins with the false inner sole for the purpose of holding the main sole in place; and of spurs with the false sole, for the purpose of securing the upper and outer soles in their proper position.

Claim.—The above-explained improvement in lasting a shoe, the same consisting in the employment of a false inner sole B, in connection with the last E and upper A, and drawing the upper on the said sole and last by means of thread or sewing *f*, or the equivalent thereof, extended across the inner sole, but without going into or through it.

Also, the combination of two or any other suitable number of pins and clamps *a b c*, or their equivalents, with the false inner sole B, and for the purpose of holding the main sole in place with respect to the upper, when the latter is confined to the false sole by thread or sewing *f*, or its equivalent, going across the false sole, in manner substantially as specified.

Also, the combination of the spurs *g g*, or their equivalents, with the false sole B and the upper A, when lasted as specified, such spurs being for the purpose of maintaining the said upper and the outer sole in their proper relation at or near the ball of the foot.

Also, the combination of one or more pins *a c*, or their equivalents, with the false sole B, and the sewing *f* extending across such sole and about the said pin or pins, substantially in manner as hereinbefore explained.

Also, the arrangement of the inner sole B and the sewing *i* by which the outer sole C and the upper A are united, the said sewing, under such arrangement, being carried around and outside of the periphery of, but not through, the inner sole.

No. 46,300.—SAMUEL JOHNSTON, assignor to himself and RUFUS L. HOWARD, Buffalo, N. Y.—*Combined Rakes and Reels for Harvesters.*—February 7, 1865.—This invention relates to that class of machines in which the rake and reel arms rotate about a vertical shaft, and it consists in an arrangement of two cam tracks or ways, in either of which the heel ends of the rake and reel arms may be made to travel at the pleasure of the operator by means of a spring gate, operated by a lever and cord, whereby the attendant is enabled to cause said reel arms (or any one of them) to act as rakes to sweep the grain off the platform whenever a sufficient amount is accumulated thereon to form a gavel.

Each reel arm is furnished with a hinged extension which reaches beyond the cutters, insuring a proper action of the reel upon all the grain within reach of the cutters, without interfering with the proper action of said arm as a rake, whenever it is desired to have it do so.

Claim.—First, making an automatic rake and reel combined, so that the operator can by means of a lever and cord, and the arrangement of two tracks or ways in which the elbow of the rake moves, cause either rake head to operate at pleasure as a rake and at the same time act continuously as a reel, all constructed in the manner herein described and substantially as and for the purposes set forth.

Second, in an automatic rake and reel combined for harvesting machines, the arrangement whereby the operator, without stopping the action of reeling, can drop either of the rake heads down to the platform and hold it thereon while removing the grain therefrom, constructed substantially as described and for the purposes set forth.

Third, the arrangement of the tracks or ways, when they are arranged so that in reeling the rake or rake head will drop down nearly to the cutters and move the cut grain back from them and then rise up and pass over the cut grain, substantially as described and for the purposes set forth.

Fourth, the arrangement of the driver's seat in connection with the lever, cord, and gate, substantially as described and for the purposes set forth.

Fifth, in a combined automatic rake and reel, changing the path of the roller which controls the motions of the rake when it is removing the grain from the platform, substantially as described and for the purposes herein set forth.

Sixth, the arrangement of the two tracks or ways in combination with the gates or switches, for the purposes herein set forth.

Seventh, the lever and spring attached to the forward gate, in connection with the cord for operating the same, for the purposes set forth.

Eighth, the use of the pointed washer attached to the elbow of the rake below the roller, for the purposes set forth.

Ninth, the hinged extension attached to the outer end of the rake head, applied substantially as described and for the purposes set forth.

Tenth, the combination of the elbow of the rake head with the roller and the outer and inner tracks or ways, constructed substantially as described and for the purposes set forth.

No. 46,301.—GILBERT D. JONES, assignor to himself and CHARLES PLACE, New York, N. Y.—*Coffee Roaster and Grain Dryer.*—February 7, 1865.—This invention consists of a series of horizontal plates, each rotating in a separate stationary box, the top and bottom of

which are also horizontal, and form the heating surfaces. The boxes are set a short distance apart, one above another, and communicate with each other at the central portion by an enclosed passage. The top surfaces of the said plates are smooth, wings being attached to the under sides over these plates, and to the top of the boxes are also attached wings. When the plates revolve, these wings agitate the berries or grain, and cause them to circulate over the plates and pass down through the apparatus.

Claim.—Forming a coffee roaster of a series of horizontal plates, each arranged to rotate within a closed box, the bottom of which is also horizontal, and which boxes receive and discharge near the centre, substantially in the manner set forth herein.

No. 46,302.—HUGH L. McAVOY, assignor to himself and ELIAS S. HUTCHINSON, Baltimore, Md.—*Apparatus for Carburetting Air.*—February 7, 1865.—This invention consists of a gas-holder contained within a vessel and provided with a sealing device, which consists of an inverted cup, the lower end of which is submerged in a liquid contained in the annular space between the cylinders. In the act of raising the gas-holder the lower end of the cup is lifted out of the liquid, and allows the air to flow into the gas-holder. The hydro-carbon liquid is introduced through the cock, and floats upon the water contained in the vessel, and the gas is withdrawn by means of a tube. A pan having a sleeve fitting over the tube, and provided with a plate, may be placed within the gas-holder to contain the hydro-carbon liquid.

Claim.—First, manufacturing air gas and enriching other gas by the described mode of using a holder C to contain air, receive the carbonaceous matter as it rises from the, oil in the form of vapor, and force the gas into the pipe, wherein it is conducted off, as explained.

Second, the plate E2, employed in connection with the pan E, to cause the air to pass to the pipe B, in contact with the oil and in a state of compressure, substantially as set forth.

Third, the sealing device, consisting of the cup F, cylinders G G, and a body of liquid between the latter, substantially as described.

No. 46,303.—JAMES S. MCCURDY, Bridgeport, Conn., assignor to ELIAS HOWE, Fairfield, Conn.—*Sewing Machine.*—February 7, 1865.—In this invention it is designed to use a single thread, but by the introduction of a bobbin and its thread in the double-headed looping hook, so that the loops of the needle-thread may pass over such bobbin; the feed being in the usual direction, a chain-stitch interlaced with the second thread running through its loops will be formed. If the feed under these conditions be reversed, a common lock-stitch would be produced.

Claim.—The combination in a sewing machine of the reciprocating needle bar with a double-headed rotating hook, so formed that when rotated in combination with a reciprocating needle it will draw a loop of needle-thread through the two preceding loops, substantially as set forth.

Also, the combination of the double-headed looping hook with the shaft that imparts motion to it by means of two pins which are controlled by a cam, the whole operating substantially as set forth.

Also, the combination of the feeding instrument of the sewing machine with a shaft making one revolution to two descents by the needle-carrier through the intervention of two cams of unequal projection, the whole operating substantially as set forth.

Also, the combination of the feeding instrument with a shaft making one revolution to two descents by the needle-carrier through the intervention of two cams and two adjustable wipers, one of said cams having two protuberances of equal projection, and the other having one protuberance of greater projection than those of the other cam, the whole operating substantially as set forth.

No. 46,304.—NATHANIEL MILES, Buckland, Mass., assignor to BAY STATE HARDWARE COMPANY, Northampton, Mass.—*Table Cutlery.*—February 7, 1865.—This improvement consists in the construction of the bolster of table knives, and is so plainly illustrated in the drawings as to need no description.

Claim.—First, in table and other cutlery the bolster C D, formed separately from the tang and having the fastening part D narrower than the scale B, and let into and concealed within the latter, substantially as and for the purpose within set forth.

Second, in connection with the above the employment of the hooks, or additional parts E E, adapted to lock the separate bolster pieces to the scales B B, the whole being concealed within the latter, substantially as within set forth.

No. 46,305.—CHARLES NEER, assignor to the ARCHITECTURAL IRON WORKS, New York, N. Y.—*Metallic Window Sash.*—February 7, 1865.—The object of this invention is to facilitate the construction of window sashes of sheet metal, with a view to render them light, cheap of construction, more durable, and in many respects superior to ordinary wooden or metallic sashes.

Claim.—A sheet or rolled-metal window sash with sides 1 2 3, flanged strips 4, two part meeting rail B', plug 9, stiles A A, and flanged strips or bars c d, all substantially as herein shown and described.

No. 46,306.—JOHN PETRIE, Jr., and JOHN KENWORTHY, Lancaster, England, administrators of the estate of SAMUEL TAYLOR, deceased, assignors to THOMAS CLEGG, North Andover, Mass.—*Machine for Washing Wool*.—February 7, 1865; patented in England July 8, 1853.—In this invention the teeth of the rotating cylinder alternately protrude and recede, in order to take up and discharge the washed wool. The vibrating frame, moving up and down, agitates and stirs the wool in the liquid in conjunction with one of the vibrating frames, whose teeth pass between those of the frame and describe a curved path, feeding the material forward.

Claim.—What is considered to be new, and therefore as the invention of the said Petrie and Taylor, is the combination of a rotating or reciprocating plunger *c*, one or more reciprocating beaters or agitators *e e'*, and a rotating wheel or drum cylinder or frame *r*, armed with teeth, prongs, or tines, the whole of such parts being applied to a trough and actuated by mechanical means, substantially as described.

Also, the combination of the rotating plunger *c* and the vibrating or reciprocating arms *e*, for stirring, agitating, and moving forward the wool in the trough.

Also, further, in combination with the trough the endless apron *w*, or its equivalent, and the squeezing rollers, the lifting drum or frame *r*, above shown and described, for raising the washed wool out of the water and depositing it on the travelling endless band or other contrivance for conveying it to the squeezing rollers or some receptacle for receiving it.

Also, the combination of the squeezing rollers, the lifting wheel, one or more stirrers or agitators, and the plunger, the whole being arranged and applied to a trough substantially as and to operate as specified; and also their combination with the vibrating frame *d*, arranged in the trough as described.

No. 46,307.—AUGUST PRUSMAN, Lingen, Hanover, assignor to BERNHARD SCHAFFER and CHRISTIAN BUDENBURG, New York, N. Y.—*Spark Arrester*.—February 7, 1865.—This invention consists in the arrangement of a conical tube, cylindrical deflector, jacket and water tank, in combination with the stack and jacket, in such a manner that the products of combustion in passing up through the inner pipes are carried between the conical suspended pipe and the deflector, from whence by their own gravity they fall into the water tank and are extinguished.

Claim.—The arrangement of the inverted conical tube *F*, cylindrical deflector *H*, jacket *K*, and water tank *I*, in combination with the smoke-stack *E*, jacket *C*, and exhaust pipe *A*, all constructed, applied and operating as and for the purpose herein set forth.

No. 46,308.—AUGUST PRUSMAN, Lingen, Hanover, assignor to BERNARD SCHAFFER and CHRISTIAN BUDENBURG, New York, N. Y.—*Spark Arrester*.—February 7, 1865.—This invention consists in combining a single pipe, constructed in such a manner that it has a decreasing diameter from its base to about one-third of its height or length, from which point it has an increasing diameter to its top, or the remaining two-thirds of its length, with a single exhaust pipe placed directly under the axis of the smoke-pipe.

Claim.—A smoke-stack *A* for locomotives, expanding from the point *a* toward the top and bottom in about the proportion herein specified, and applied in combination with the exhaust pipe *B*, in the manner and for the purpose described.

No. 46,309.—THOMAS SHAW, assignor to himself and PHILIP S. JUSTICE, Philadelphia Penn.—*Mode of Compensation for loss of Motion*.—February 7, 1865.—This invention consists in the employment of a spring to receive surplus motion in the operation of engine counters requiring a regular and measured stroke.

Claim.—The combination of spring *k* and *m*, crank wheel *d*, and rod *f*, when connected with the recording movement *n*, in order to operate engine counters requiring a regular measured stroke, in the manner and for the purpose herein described.

No. 46,310.—GEORGE K. SNOW, Watertown, Mass., assignor to himself, MARCH BROTHERS, PIERCE & Co., Boston, Mass.—*Paper Shirt Collars*.—February 7, 1865.—This invention consists in the imitation stitching on both sides, so that the collar may be reversed or turned down.

Claim.—Improved manufacture of paper collars—that is, one having on each of its two opposite sides indentations or imprints in imitation of stitching, the whole being substantially as and for the purpose specified.

No. 46,311.—E. VALENTINE and M. T. RIDOUT, assignors to themselves and WILLIAM BECK, Milwaukee, Wis.—*Machine for Making Metallic Tubes*.—February 7, 1865.—This device consists of a tapering mandrel secured in a standard, sliding vertically through a slot in the table or platform of the machine. On each side of the mandrel, but a little below its level, are hinged two clamps, the free ends of which pass beyond the standard. The space between these clamps corresponds in shape and size to the mandrel and thickness of the metal to be operated on. This is cut in the proper shape, and adjusted across on the top of the clamp: the mandrel is then depressed, bending the metal between the clamps, which then close and swage the metal around the upper surface of the mandrel, which is then allowed to rise, and the tube finished for soldering is removed.

Claim.—In combination with a movable mandrel G, or its equivalent, the hinged sliding jaws A A, pivoted upon a supporting block or table B, and operating substantially in the manner and for the purpose herein set forth.

Also, in combination with the jaws A A and movable mandrel G, or its equivalent, securing said jaws by adjustable pivots so as to adapt them to mandrels of different proportions, substantially in the manner herein set forth.

No. 46,312.—HENRY W. VEREGGE, assignor to BENJAMIN C. WHITE, MARSHALL HENRY and WILLAM CAIN, Jr., Richmond, Ind.—*Fanning Mill.*—February 7, 1865.—This invention relates to the method of hanging the sliding doors to supply air to the fan wheel, and consists of grooves on the inside of the strips which hold the doors in place, and a corresponding projection attached to the outside of the door which fits into the groove. The advantage claimed is, that the doors do not become clogged with dust.

Claim.—Hanging the slides or shutters of fanning or other similar mills to the frame, or to a piece connected to the frame by means of a tongue, strip, or block on said slides or shutters, and a horizontal groove or grooves in the face of said frame or piece, as and for the purpose set forth.

No. 46,313.—WILLIAM YOUNG, Washington, D. C., assignor to himself and CHARLES F. STANSBURY, Philadelphia, Penn.—*Ship's Galley.*—February 7, 1865.—This invention consists of a caboose stove for burning coal, having three grates in front so arranged that one or all may be used at a time, and a rear grate, over which are three large boilers. Over a central front grate is a large oven, and between the front and rear fires is another; the products of combustion from the front fires circulate up around and over the front oven, on top of which are apertures for cooking vessels; boilers may be placed over the side fires; and on the top of the stove boilers or cooking vessels can be used. Pipes from the top of the large boilers convey the steam arising in cooking to the smoke flue. Convenient arrangements are provided for the draught and for removal of ashes. The smoke flue is so divided by a central partition as to give separate passages from the front and rear fires. The galley is designed chiefly for use in vessels of the navy.

Claim.—First, the combination and arrangement of the fireplaces A' B' C' and D' and the oven E', substantially in the manner and for the purpose specified.

Second, the arrangement and combination of the fireplaces A' B' C' and D', with the oven E', substantially in the manner and for the purpose described.

Third, the arrangement and construction of the fireplaces A' B' C', oven E', and side recesses J K L and J' K' L', substantially in the manner set forth.

Fourth, the arrangement in a ship's galley of three or more fireplaces varying in capacity, substantially as and for the purpose described.

No. 46,314.—EMANUEL BURG, Basle, Switzerland, and LOUIS GUILLEMIN, Dieboldsheim, France.—*Machine for Dressing and Finishing Threads, &c.*—February 7, 1865.—This invention relates to an apparatus which is applicable for the purpose of dressing, finishing, and imparting lustre or gloss to all threads or filaments of silk, cotton, flax, and other fibrous substances, but more especially to yarn thread, or filaments of waste silk, or floss silk, which, by the use of this apparatus, can be rendered equal in appearance to silk, and thereby much enhanced in value.

Claim.—The combination of a winding frame, substantially such as herein described, with the bobbins *b*, bath *c*, wipers *g*, and steamchests *h* and *i*, all constructed and operating in the manner and for the purpose substantially as set forth.

No. 46,315.—AUGUSTE DESGROFFE and ACHILLE OLLIVIER, Paris, France.—*Hydraulic Apparatus.*—February 7, 1865.—This invention consists in gradually introducing into a water-tight vessel or box, which is filled with water or other non-compressible liquid, and provided with one or more movable sides or fixtures, or made expandible, a cord or rope, in such a manner that by said rope powerful pressure is exerted on the sides of the box, which, when movable or expandible, transmit the power thus exerted on their inner surfaces to bodies placed against their outer surfaces, and a powerful pressure can be exerted with comparatively little power and with an apparatus of a simple and cheap construction.

Claim.—The employment or use of a rope *h*, or its equivalent, in combination with a box A, provided with one or more plungers or movable sides, or made of some expandible material, substantially as and for the purposes set forth.

No. 46,316.—CHARLES SCHOUBERSZKY, St. Petersburg, Russia.—*Mode of Regulating Motion of Railroad Car Trucks.*—February 7, 1865.—This invention consists in the employment of two heavy fly-wheels secured to the ends of the axle, which rests either directly or indirectly upon the driving wheels of a truck in such a manner that by the action of said fly-wheels the velocity of the truck is rendered uniform, and the momentum stored up in said fly-wheels; when the truck is going down hill will assist the locomotive in drawing a train up an incline.

Claim.—The fly-wheels A A connected to an axle B, and supported by the peripheries of the driving wheels of a truck, with or without intermediate friction wheels, substantially as and for the purpose set forth.

No. 46,317.—WILLIAM ADAMSON, Philadelphia, Penn.—*Process for Disinfecting Noxious Vapors*.—February 14, 1865.—This invention consists in burning spent tan-bark with the fuel used in rendering lard, tallow, &c., and directing the vapors generated into the chimney along with the products of combustion, so as to disinfect the vapors from the lard or tallow.

Claim.—The use for disinfecting or deodorizing the fumes arising from burning, boiling, or fermenting animal matter of the products of combustion of spent tan-bark, old leather, or other material containing tannin, as set forth.

No. 46,318.—WILLIAM ADAMSON, Philadelphia, Penn.—*Method of Treating Offal*.—February 14, 1865.—This invention consists of a house provided with a perforated floor and fireplace. The offal is placed upon hay or twigs, which are spread upon the perforated floor and allowed to drain, after which a fire is made in the fireplace and the products of combustion allowed to pass up into the offal until it is perfectly dry.

Claim.—Utilizing offal by draining, drying, and disinfecting it, substantially in the manner described.

No. 46,319.—OLIVER ALLEN, San Francisco, Cal.—*Butter Mould*.—February 14, 1865.—This invention consists in forming a mould by which butter may be divided into parcels of such a shape and quantity as are required in preparing it for market, the mould being varied in size and shape to suit the demand.

Claim.—A butter mould, constructed and operating substantially in the manner herein shown and described.

No. 46,320.—CYRUS W. BALDWIN, Charlestown, Mass.—*Hot-air Engine*.—February 14, 1865.—This invention relates to an arrangement for guiding flexible disk valves without hinges or central stems, and consists in pins placed at its sides and ends in a vertical position to the plane of the valve, thus allowing it to move vertically in leaving its seat. It also consists in the arrangement and combination of a secondary fire box, so placed that the products of combustion, in passing from the principal fire box to the engine, pass through it and in contact with the fuel therein, for the purpose of completing the combustion of any gaseous matter that may escape from the first or principal fire box or furnace. It further consists in placing within the principal furnace an enclosing ring, whose inner circle is perforated so as to direct the jets of air to all parts of the furnace on a level with it. This ring is hollow, and the air for the support of combustion is forced into it by the pump, and it is so arranged that it can be changed to any position between the top and bottom of the furnace.

Claim.—First, guiding a flexible disk valve, substantially as described.

Second, the employment of a secondary furnace, in combination with the primary furnace and the cylinder of a hot-air engine, when located so that the products of combustion from the primary furnace go through the secondary furnace on their passage into the cylinder, substantially as and for the purpose set forth.

Third, the arrangement in the furnace, in connection with a suitable opening or openings through the wall thereof into the air-conduit pipe, of a perforated, movable, air-passage ring, so as to be interchangeable with the movable lining rings.

No. 46,321.—E. BALL, North Manchester, Ind.—*Plough*.—February 14, 1865.—This invention consists in casting the plough beam of curved form, longitudinally and transversely, the rear part having a straight portion or surface for attaching the share and mouldboard. The land side is fastened by means of a dovetail and bolt.

Claim.—A cast iron plough beam, of curved form, longitudinally and transversely, and the lower and rear part having a straight portion or surface for the attachment of the share and mouldboard, substantially as shown and described.

Also, attaching the land side D to the beam by means of the dovetail e at its front end and a bolt passing through the land side, and a flange f at the rear of the beam, as set forth.

No. 46,322.—WILLARD N. BALL, La Porte, Ind.—*Snow Plough*.—February 14, 1865.—This invention relates to a plough for cleaning railroad tracks of snow, and it consists in the use of rotary shovels, in connection with scrapers, and constructed so as to be capable of being folded and expanded.

Claim.—First, the scrapers C C, in combination with the rotary shovels F, arranged and applied to a car or truck, to operate in the manner substantially as and for the purpose set forth.

Second, the rotary shovels V, arranged in relation with the shovels F, and to operate in connection therewith, substantially as and for the purpose specified.

Third, the arrangement of the shovels V substantially as herein shown and described, so that the same may be capable of being folded and expanded, as set forth.

Fourth, the slide U and links Y, arranged as shown, for folding and expanding the shovels V.

Fifth, the reversing gear M M, when applied to and used in connection with the gear of the rotary shovels F V, for the purpose set forth.

Sixth, the combination of the rotary shovels F V and scrapers C, when arranged to operate substantially as and for the purpose specified.

No. 46,323.—JOHN H. BALSLEY, Dayton, Ohio.—*Machine for Drying Tobacco*.—February 14, 1865.—A cylinder is provided with fingers or lifters upon the inside, which keep the tobacco in a state of motion as the cylinder revolves, and through which a current of heated or rarefied air passes. At the lower end of the cylinder the circumference is provided with a screen, composed of wire cloth, through which dust and fine particles pass, while the long fibre passes out at the end of the cylinder.

Claim.—First, a machine, constructed as herein described, for subjecting fine and common cut tobacco to an agitating and separating action, and at the same time to a current or currents of air, said air being heated, rarefied in the common way, all substantially as described and set forth.

Second, the rotating cylinder B J, in combination with a fan box F and endless apron E, arranged and operating substantially as described, for the purpose set forth.

No. 46,324.—ISAAC BANNISTER, Newark, N. J.—*Buckle*.—February 14, 1865.—This invention consists in the combination of two buckles, acting upon one centre bar, in contrary directions from the centre, the upper tongue resting upon the top of the frame, and the other tongue resting beneath the under frame.

Claim.—The combination of two buckles acting upon one centre bar, in contrary directions from the centre, the upper tongue resting upon the top of the frame, and the other tongue resting under the under frame, as set forth, and for the purpose named above.

No. 46,325.—JOHN BARNARD, Alton, Ill.—*Mode of Adjusting Circular Saws on their Arbors*.—February 14, 1865.—Two clamping collars are attached to an arbor by means of a feather working in a longitudinal groove in the arbor, so that the clamping collars, with the saw between them, are capable of lateral adjustment upon the arbor. This adjustment is effected by means of nuts acting upon the collars and working on a screw-thread on the arbor. The saw is slipped on a hub on one of the collars, over which the other collar fits.

Claim.—First, so applying a saw to an arbor, having a screw-thread cut on it, that the saw, together with its clamping collars, can be adjusted and set at any desired point on the arbor, substantially as described.

Second, the combination of laterally-adjustable clamping collars C C' with jamb nuts B B', when the latter are fitted to work on an arbor, having a screw-thread cut on it, substantially as herein described.

No. 46,326.—JOHN BAVIER, Newark, N. J.—*Buckle*.—February 14, 1865.—This invention consists in having the tongue or tongues operating outside the buckle at its extremities. The strap is held between the tongue and the edge of the top plate.

Claim.—A buckle with a tongue or tongues that operate by turning outward at the ends of the buckle, constructed substantially as shown.

No. 46,327.—EDWARD BURKE, Philadelphia, Penn.—*Washing Machine*.—February 14, 1865.—This invention consists in the combination of an ordinary washboard with a platform secured at the lower end which is to rest on the bottom of a common wash tub. Metallic arms are attached to the platform, and these partly secure the board to the tub, and the rubber to the washboard. To the rubber is secured a metallic bar in which is a slot, a clamp sliding in the slot so that the rubber is made to move directly across the washboard from top to bottom.

Claim.—The combination of the following parts: the washer *g*, in connection with the handle C C', clamp *b b*, bar *f*, axles K and K', by metallic fixtures in slots in uprights C and C, in combination with platform A a', India-rubber bands *h* and *h*, and washboard A, placed on an inclined plane, for the purpose specified.

No. 46,328.—CHARLES S. BROWN, New York, N. Y.—*Steam-heating and Fire-extinguishing Apparatus*.—February 14, 1865.—This invention consists in the combination of a steam engine, boiler, and steam-heating pipes arranged so as to carry water to extinguish fires in the building or apartment heated by the pipes, the arrangement being such that the pipes carry either steam or water, or both, to all points to which they extend.

Claim.—The combination of the steam engine, boiler, pump, and steam-heating pipes, arranged substantially as described, so as to be utilized to convey water to extinguish fires, in the manner set forth.

Also, connecting to the steam-heating pipes a pipe to supply water from a hydraulic engine or pump, or other source, and force it through said steam pipe to extinguish the fire in or around the building heated, substantially as shown and described.

Also, in combination with the steam-heating pipe or apparatus, and water supply pipe, a stop-cock or valve in the steam pipe, between the boiler and the junction of the water pipe with the steam pipe, to stop the water from running toward or into the boiler which supplies the steam to the heating pipe, substantially as shown and described.

No. 46,329.—JAMES BRADY, U. S. vols., Philadelphia, Penn.—*Sight for Ordnance*.—February 14, 1865.—This invention is applied to a pendulum sight having two graduated standard bars and one sliding extension bar between the standards, it being fixed in one and sliding on the other and made adjustable, resembling the letter T supported at its extremities.

Claim.—First, the combination of the movable sight G, with the standard bars E E, for the purpose set forth.

Second, the combination of the sight H, with the extension bar F, for the purpose set forth.

No. 46,330.—HENRY BOCK, New York, N. Y.—*Machine for Making Buttons.*—February 14, 1865.—This invention, relating to glass buttons, consists in the arrangement of a plate or pressure bar above the die block which acts upon the back of the button, while the glass is pressed into the countersunk die, the pressure bar being provided with a slot to receive the eye of the button, to be pressed into the melted glass.

Claim.—The arrangement and combination of a presser bar or plate H above the die block, provided with a slot *n*, to receive the eye of the button, and operating in the manner and for the purpose substantially as described and set forth.

No. 46,331.—S. E. BLAKE, Worcester, Mass.—*Device for Cutting and Shaving Ice.*—February 14, 1865.—This invention consists in the combination of a rotary cutter, with a follower operated by an elastic spring, all arranged in a suitable box with a discharge spout, so that ice can be cut and shaved for immediate use.

Claim.—The rotary cutter disk F, in combination with the follower K, operated by the elastic spring L, by which the ice is held up to the cutter, the whole enclosed in a box or case, substantially as described and represented.

No. 46,332.—WM. S. BELL, Jr., Boston, Mass.—*Paper Collar.*—February 14, 1865.—The band portion of the collar is cut out broad so as to be folded upon itself, and the turn-down or exterior part is folded over the turned up edge of the supplemental or strengthening part of the band.

Claim.—First, doubling the thickness of this band and cementing the folds together, substantially in the manner set forth.

Second, folding the collar upon the line *b*, by making the edge *a* the guide in such operation.

No. 46,333.—THOMAS BELL, Bellport, N. Y.—*Mode of Raising Sunken Vessels.*—February 14, 1865.—This invention consists in a method of constructing the floats employed for raising vessels, whereby they are enabled to be kept in place; also, in a system of iron pipes passing through the floats for the reception of lifting chains, whereby the slipping of the said chains is prevented, which occurs when they pass over the edges of the floats; also, in a system of rigid braces for keeping the vessel upright in the floats when partly raised, or when a portion of it is above the surface of the water; and further, in a system of plates for attaching the chains to the vessel.

Claim.—First, the camels or floats, constructed with transverse beams *d* and adapted to receive the stem or stern of a vessel, in the manner herein described.

Second, the pipes *i*, in combination with floats A A, of the construction specified for the lifting chains to work through, substantially as and for the purpose herein specified.

Third, the braces *k k*, applied in combination with the floats A A, substantially as and for the purpose herein set forth.

Fourth, the attachment of chains to the vessel to be raised by means of plates *n n* secured to the vessel by screws, substantially as herein described.

No. 46,334.—ROWLAND J. BEARDSLEY, Brooklyn, N. Y.—*Caster for Furniture.*—February 14, 1865.—This invention consists in cutting a screw thread on the exterior of the hollow socket through which the spindle passes, to enable the said socket to be screwed into a hole in the leg of the table or other piece of furniture. The upper end of the spindle is riveted over in such manner as to form a countersunk head that will revolve in the socket.

Claim.—A wheel caster, having a screw thread on the outer surface of the socket which receives the revolving spindle, when this spindle is passed through the socket and attached thereto by means of a head formed on its upper end, as herein described.

No. 46,335.—DANIEL CLARK and THOMAS STEVENSON, Buffalo, N. Y.—*Mode of Operating the Swell of Melodeons.*—February 14, 1865.—This invention consists in connecting the swell and bellows by means of straps, so that by an extended movement of the bellows the swell may be closed by one foot and opened by the other.

Claim.—Operating the swell of melodeons and other similar musical instruments by means of the bellows pedals, substantially as described.

No. 46,336.—CHARLES CLINTON, Blooming Grove, N. Y.—*Car Coupling.*—February 14, 1865.—This invention relates to a self-acting coupling, and consists in the employment of two jaws placed one over the other within a draw-head, and hung upon journals which are connected at one end by levers, in connection with a shackle or coupling pin, provided at each end with a head; by which means a coupling is obtained which will not only connect itself, but one which may be readily disconnected without the necessity of the operator passing between the cars.

Claim.—The two jaws D D arranged within the draw-head A, substantially as shown, and operated by the gravitating levers E F pivoted respectively to the upper journal *e* and at *f*, and by a link to the other journal *e*, the said levers being shackled together by the link G, the whole arranged substantially as described and represented.

Also, the socket and spring B, in combination with the shackle or pin H and jaws D D, all arranged substantially as and for the purpose specified.

No. 46,337.—P. COLEMAN, Philadelphia, Penn.—*Machine for Making Nuts.*—February 14, 1865.—This invention consists of a gauge bar or stop, against which the nuts are successively pushed, in order to adjust them to the proper position relative to the punch. By means of the cam and lever the gauge bar is thrust across the path of the blank, so as to intercept it and prevent its further forward movement, and is retained in that position until the punching has been effected, when the cam having passed from against the lever, a spring draws the gauge bar back out of the way, and thus permits the punched nut to be pushed forward by the column of blanks which succeed it.

Claim.—The combination of the wheel A, projecting cam B, lever C *a*, slide F, and spring G, when constructed, arranged, and operating as herein specified.

No. 46,338.—MARCELLUS V. CUMMINGS, Winthrop, Me.—*Railroad Switch.*—February 14, 1865.—This invention relates to a railroad switch of that class which is commonly termed self-acting—that is to say, is set by the train itself so as to form a connection with the rails of the track on which the train is to pass.

Claim.—The two frog bars I I', bent or L-shaped levers E G connected with the frog bars and the switch rails, substantially as and for the purpose herein set forth.

Also, the suspended arms K K', arranged respectively with the bar F and lever J, substantially as and for the purpose specified.

No. 46,339.—JOHN DALEY and JOSEPH H. MARVILLE, Philadelphia, Penn.—*Tool for Scaling Tubes to Boilers.*—February 14, 1865.—The object of this invention is to remove the scale or incrustation from the internal surface of the tubes of steam boilers, and to perform this process with facility. Its novelty consists in the combination and arrangement of the cutters in the cutter stock, the screw shaft, the circular cutter, and the two guides.

Claim.—First, the combination and arrangement of the cutters *a b* in the cutter stock A, the cutter stock being operated by the central screw shaft C, substantially as herein set forth.

Second, the combination and arrangement of the circular cutter B with the cutter stock A, substantially as and for the purpose set forth.

Third, the combination of the guide D with the screw shaft C, arranged in relation to the tubes, substantially as and for the purpose set forth.

Fourth, the combination of the guide F with the screw shaft C, substantially in the manner described and for the purpose specified.

No. 46,340.—M. P. DORSCH, New York, N. Y.—*Machine for Making Paper Collars.*—February 14, 1865.—A platen moving vertically carries upon its face, or under side, first, the embossing and punching parts, and, secondly, the excising die. The platen is moved reciprocally by an eccentric upon a horizontal shaft above. The platen operates in its movements a clamping frame-work which carries the paper forward a distance equal to the width of the collar, after every impression or descent of the platen.

Claim.—The reciprocating feeding frame with the sides thereof grooved to receive the sheet of paper, in combination with the gripping fingers, substantially as described, and having a mode of operation such as described and for the purpose specified.

Also, the reciprocating feeding frame with its gripping fingers, operating substantially as herein described, in combination with the dies for embossing and cutting the collars, substantially as described.

No. 46,341.—DAVID H. DOTERER, Philadelphia, Penn.—*Construction of Railway Cars.*—February 14, 1865.—This invention consists in constructing the sides and ends of a car body of successive layers of wood, of any required width and thickness, cemented and bolted together so that the full strength of the material is preserved, and the usual mode of framing by means of mortises and tenons obviated. It also consists in stiffening and strengthening the side of said car body, by the use of tubes, through which the clamping bolts are passed; said tubes and bolts being enclosed within the sides of the body and recessed into the sills and cap pieces. The car body is constructed of two or more sections, which are so put together that should one end or section be injured it can be readily detached from the other end or section, and a perfect one substituted for it, so that a damaged car may be quickly repaired.

Claim.—First, a car body which is composed of successive horizontal layers or strips of wood secured one upon the other by means of cement and metal clamping rods *c c*, substantially as described.

Second, the use of tubes *a a* in combination with the clamping rods *c c* and a car body, constructed substantially as described.

Third, constructing a car body of two or more sections, put together in such manner that they can be separated at pleasure, substantially as described.

Fourth, the method of applying the links *e e* to the ends of the sections of a car body, substantially as described.

No. 46,342.—JAMES B. EADS, St. Louis, Mo.—*Operating Ordnance*.—February 14, 1865.—In this invention the gun is supported on its carriage by a combination of arms or links so arranged as to force the gun to oscillate about a point at its muzzle when being elevated or deflected. The chassis of the gun in like manner is so controlled by link-connections as to train the gun horizontally about a point at the muzzle of the gun; this point being forward of the mechanical devices by which these radial movements are effected.

Claim.—First, supporting a gun of two different points in its length by a combination of devices on a gun carriage acting in connection with each other in such a manner as to rigidly compel the gun whenever it is moved in a vertical plane to rotate about a point in advance of said devices and at or near its muzzle.

Second, controlling the horizontal movements of the chassis or lower carriage which supports the gun carriage by a combination of devices acting in connection with each other upon the chassis at two different points in the length of the latter in such a manner as to rigidly compel its longitudinal axis to rotate about a point in advance of the chassis and the devices which control its movements, so that the centre of rotation may be on the exterior of a defence wall, while the devices are on the inner side of it at some considerable distance from the centre of rotation.

Third, the use of the axis 6, figure 1, at a point not the centre of rotation of the chassis, when used in combination with other devices for the purpose of producing a centre of rotation for the chassis at a different point from said axis.

Fourth, the use of axis 6, figure 1, at a point not the centre of rotation of the chassis, when used as a channel for the conveyance of power to operate the gun.

No. 46,343.—CHARLES W. FOGG, Waltham, Mass.—*Watch*.—February 14, 1865.—This invention consists in attaching one of the pinions of the train to its arbor, by means of a screw thread, so that when it is driven in the direction it is intended to turn, it will be down in its place and in gear, but in the event of the breakage of the main spring, the force of the recoil will cause it to revolve in the opposite direction, when it will rise on its arbor out of gear with the wheel into which it takes, thereby avoiding all liability of derangement of the train.

Claim.—Attaching one of the pinions of the train to its arbor by means of a screw thread, substantially as set forth, for the purpose specified.

No. 46,344.—CLINTON FOSTER, Prairie City, Ill.—*Seeding Machine*.—February 14, 1865.—This invention consists in placing the seed-boxes and seed-distributing devices within the wheels of the machine; the seed passes through openings in the periphery of the wheels, and is pressed into the earth by means of circular rotating disks, placed also within the wheels, and which project through the openings above mentioned.

Claim.—First, the main wheels B B, which revolve upon the hollow fixed axles, with the flange *b* that opens the furrows to receive the seed through the open spaces *c* between the flanges *b b*.

Second, the hollow axles E E in combination with the sliding rod M, screw shafts F, and circular disks I, all arranged to operate substantially as and for the purpose specified.

Third, the circular disks I, in combination with the wheels B, the latter being provided with spaces C, and the former provided with notches *e*, all arranged substantially as and for the purpose set forth.

No. 46,345.—NATHANIEL C. FOWLER, Yarmouth Port, Mass.—*Artificial Teeth*.—February 14, 1865.—In this invention the "palate-plate" and "guard-plate" in sets of artificial teeth are constructed of hardened wrought aluminum which is secured to a plate of vulcanite by means of tapering holes made in the metal into which the vulcanite is forced.

Claim.—The combination as well as the arrangement of the metallic guard-plate C, the vulcanite D, and the metallic inner plate B, applied to artificial teeth substantially as specified. Also, the combination of the series of tapering holes, *b* or *c* with the aluminum plate in which they are formed, the vulcanite and the artificial teeth, substantially as specified.

Also, as an improved manufacture, a set of any suitable number of artificial teeth and one or more aluminum plates combined by means of a composition, as hereinbefore described, or its equivalent.

No. 46,346.—NATHANIEL C. FOWLER, Yarmouth Port, Mass.—*Artificial Teeth*.—February 14, 1865.—This invention consists in securing an aluminum plate to the vulcanite base, by means of hooks or staples which are punched out from the plate and form part of it; also, in the use of tapering holes, into which the vulcanite is pressed and thus secured to the plate.

Claim.—The improved manufacture of aluminum suction plate for dental purposes—that is, with holes and hooks or staples combined with it, and made by means substantially as specified.

No. 46,347.—NATHANIEL C. FOWLER, Yarmouth Port, Mass.—*Combination of alloys of Aluminum with Vulcanite*.—February 14, 1865.—This invention is designed as a modification of the invention for which letters patent were issued to the same inventor, dated February 7, 1865. The improvement consists in using the alloys of aluminum or other metals coated with aluminum, instead of pure aluminum as proposed in the former patent. The object of this improvement is either to economize the use of aluminum, or to produce an alloy of better color.

Claim.—First, the combination of an alloy of aluminum with vulcanite, when the said alloy is used as means of attachment to or in contact with vulcanite, or as a means of attachment to other material exposed to the vulcanizing process.

Second, the combination with vulcanite of metals coated or plated with aluminum or its alloys, in which the said coating or covering is in contact with the vulcanite or exposed to the process of vulcanization.

No. 46,348.—G. C. GILLETTE, Richfield, British Columbia.—*Parallel Ruler*.—February 14, 1865.—This invention consists in connecting the two bars of a parallel ruler by levers, joined together by two cogged bars in such a manner that the instrument is made to open vertically, thus avoiding errors arising from unequal wear of the joints. The invention also consists in combining with the parallel rulers a graduated limb, in such a manner that the same distances which are laid horizontally by one of the bars of the ruler can be laid off vertically by the said limb.

Claim.—First, the levers $d d' d'$, joined together by the cogged bars $e e$, in combination with the bars $A A'$ of a parallel ruler, constructed and operating substantially in the manner and for the purpose herein shown and described.

Second, the graduated limb c , applied in combination with the two parts of the parallel ruler, substantially as set forth, for the purpose of laying off vertically the same distance which can be measured horizontally on the bar.

No. 46,349.—SAMUEL GULICK, Kline's Grove, Penn.—*Cultivator*.—February 14, 1865.—This invention consists in a frame mounted on an axle with two wheels. It also has an auxiliary frame inside of the main frame, pivoted at the front end, to which a lateral motion may be given by means of foot levers, and also by a long lever projecting in the rear of the main frame. The ploughs are raised by means of chains attached to the plough beams and passing over pulleys upon a shaft in which a lever is secured for the purpose.

Claim.—The frame D fitted on the axle A , and connected by chains or cords $E E$ to fast pulleys $F F$, on a shaft G , which has its bearings on uprights $C C$, attached to the axle, and which serve as guides for frame D' , all being arranged as shown with a lever and notched bar, or their equivalents, whereby said frame may be raised and lowered bodily and secured at any desired height for the purpose specified.

Also, the pivoted bars $Q Q$ when applied to and used in combination with the adjustable frame D , substantially as and for the purpose set forth.

No. 46,350.—JOHN D. HALL, Philadelphia, Penn.—*Bread and Meat Slicer*.—February 14, 1865.—The cutting edge is in the form of a geometrical spiral, upon a tapering shaft. The material to be cut is placed in a trough, the bottom of which is corrugated to prevent the sliding or twisting of the material during the operation. An automatic feed-gauge, against which the material to be cut is pressed by hand, is adjusted so as to regulate the thickness of the slice at pleasure, and is kept continually at the proper distance in advance of the cutting edge during its revolution, so as to allow the slice to be inclined by the wedging pressure of the cutter, and finally to fall down as soon as it is cut entirely off.

Claim.—The combination of the rotary cutter C with the cam K and feed-gauge H , for the purposes specified; and in combination with the above, corrugating the interior surface of the trough D , for the purpose set forth.

No. 46,351.—JOSIAH C. HAMILTON and HENRY W. HAMILTON, Washington, D. C.—*Windlass for Operating the Centre-boards of Vessels*.—February 14, 1865.—This invention is explained by the claim.

Claim.—The application and arrangement of a conical screw drum on the deck or other place of a vessel, in combination with the centre-board, whereby the slack to the rope or chain produced by the buoyancy of the water pressing the board upward, is taken up by the increased surface of the drum in its revolution, substantially in the manner described.

No. 46,352.—NATHAN HARPER, Newark, N. J.—*Turning Lathes*.—February 14, 1865.—The object of this invention is to produce a lathe to expedite the turning of irregular or straight surfaces, and it consists in placing a form or pattern of the shape to be turned so that a tool stock, which is in two parts, one part sliding in the other, and each carrying tools, and through which the object to be turned passes. One of these tools is free to play at right angles to the axis of the stuff, and the other cutter moves in a line parallel with the centre of the object to be turned. The sliding part of the tool carrier is so arranged that its movement at right angles is controlled by two pins projecting from the slide and bearing on the form or pattern while being fed along by a feed screw to its work.

Claim.—First, the use of slides carrying cutters having free play in a plane at right angles to the axis of the stuff or thing being cut, in combination with springs and shaping bars.

Second, the use of a compound sliding rest, consisting of a slide carrying a cutter that moves in a straight line parallel with the centre of the thing being cut, in combination with a slide or slides carrying a cutter adapted to move in a plane at right angles to the axis of the thing being cut or shaped.

No. 46,353.—JAMES W. HARRISON, Washington, D. C.—*Machine for Making Book Covers.*—February 14, 1865.—In this invention a set of adjustable gauges hold the covers and back in place, while folding wings are made to turn the cloth or paper over the edges.

Claim.—First, the gauge, the same being so constructed as to form a box or receptacle to contain a quantity of back linings, and so operated as to place them automatically one at a time in the "case;" at the same time the gauge is in its position for placing the pasteboards as described, for the purpose herein set forth.

Second, in combination with the adjustable back gauge, the adjustable automatic folding wings, the same being operated by cams or foot pedals, levers, and springs, for the purpose of turning over and securing the cloth on the "cases" in making book covers, as herein specified.

No. 46,354.—HENRY HARROP, Greenwich, N. Y.—*Mode of Ornamenting.*—February 14, 1865.—This invention consists in the printing of lithographic designs, which are transferred to the articles to be ornamented after the transfers are bronzed or gilt, &c.

Claim.—The mode or process, substantially as herein described and set forth, for ornamenting or decorating articles of manufacture.

No. 46,355.—SAMUEL HENRY, Chenoa, Ill.—*Cultivator.*—February 14, 1865.—This invention consists in an arrangement of levers for raising the plough beams. A lever has its fulcrum upon a cross-piece in front of the axle. Straps are connected with its front, and lift the front plough beam. A few inches in the rear of the fulcrum a pendant operates upon the end of the rear plough beams, thus lifting both beams at one motion of a single lever.

Claim.—The arrangement of the levers J J, connected by straps *h* to the pivoted frame F G, and by pendants K K to the plough beams L L, which are hinged to the axle, the said frame F G being further capable of lateral deflection by pressure of the feet of the driver, substantially as and for the purposes described.

No. 46,356.—BENJAMIN B. and JOHN R. HILL, Worcester, Mass.—*Box Traps for Animals.*—February 14, 1865.—This invention consists of an ordinary box or four-sided trap, with the bottom extended at both ends. Two spring detents are so arranged on these extensions that when the two end doors fall by their own weight, being released by the animal at the bait, they pass over the springs, pressing them down, and the doors, when closed, are locked by the springs, which rise up behind them, forming automatic detents.

Claim.—The locking catches D D D D, when constructed and operating in the manner and for the purposes above set forth.

No. 46,357.—N. HILL, Caton, N. Y.—*Carpet Stretcher.*—February 14, 1865.—This invention consists of two flat blocks having their lower surfaces provided with a series of points, and two stretching bars, each composed of two parts capable of moving or sliding one over the other, and held together by bands attached to their extremities.

Claim.—The combination of the duplicate extension bars B B', provided with bands C C C C, and locking pins D D, with the spur blocks A A', whereby I secure the required range and efficiency, as well as compactness for transportation, substantially as described.

No. 46,358.—JAMES B. HODGSKIN, New York, N. Y.—*Pencil Point Protector and Mark Eraser.*—February 14, 1865.—This invention consists in providing the sleeve with a sunken band, to prevent the pencil point from entering too far, and of having a piece of India-rubber inserted at the opposite end.

Claim.—The pencil-point protector and pencil-mark eraser made by combining the sleeve or band B, provided with inwardly projecting groove, or equivalent internal projection or projections, with the rubber eraser C, substantially as herein described, as a new article of manufacture.

No. 46,359.—JAMES HOLLAND, Conshohocken, Penn.—*Barrel for Holding Petroleum and other Oils.*—February 14, 1865.—This invention consists in providing a barrel with an inner casing of such a size as to leave a space between it and the inner surface of the barrel; this space being filled with a composition of coal, tan, and roofing cement.

Claim.—A barrel composed of the outer casing A and the inner casing B, in combination with an intervening body of cement or equivalent material, substantially as specified.

No. 46,360.—NICHOLAS HOTZ, Brooklyn, N. Y.—*Pump.*—February 14, 1865.—The vertical cylinder in this pump has an induction pipe from the well opening into one side of its bottom plate. There are two pistons—one carried by a rod passing through the top, the

other carried by a rod passing upwards through the bottom plate. These pistons, which have flap-valves seated upon them, are moved from and towards each other by the operation of a brake on top, which works one rod within the cylinder and another without, the latter being so linked to the lower piston rod below the cylinder as to move the same upwards as the upper one descends.

Claim.—The sliding rods $C\ C^2$, guides D , links $N' N^2$, and arms $c' c^2$, in combination with the hand lever M and the two movable valve boxes $B' B^2$, all arranged and operating together as herein set forth.

No. 46,361.—CHARLES H. HUDSON, New York, N. Y.—*Attachment for Washboard.*—February 14, 1865.—This invention consists of devices so arranged that the common washboard and the rubbing attachments can all be folded up within a small compass.

Claim.—First, the changable or folding washboard mechanism herein described, the standards $B\ B$ being hinged to the sides of the washboard by means of pins b standing in the slots a' adapted to fit over c , to hold the parts rigidly or release them for folding when desired, substantially as and for the purpose herein set forth.

Second, the bracketed plates $G\ I\ G\ I$ hinged on the arms $E\ E$, rigidly connected together by the brace J , and carrying two or more rollers $H\ H$, substantially as and for the purpose herein set forth.

No. 46,362.—D. F. HUMPHREY, Saline, Mich.—*Plough.*—February 14, 1865.—This invention consists in an adjustable landside pivoted at its forward end with a hook in the landside proper, and adjustable at its rear end by a slot, notched washer, nut, and screw-bolt.

Claim.—The movable or adjustable landside C , provided at or near its forward end with a hook which engages with a hole in the landside A , and fixed adjustably in a vertical slot in the latter by means of the notches g , the notched washer e , and the screw-bolt and nut $c\ f$, as described and represented.

No. 46,363.—JOHN H. IRWIN, Chicago, Ill.—*Burner for Lamps and Lanterns.*—February 14, 1865.—This invention consists in the employment of two or more wicks in one wick tube with a partition between them, and operated independently by two ratchet wheels, so that the flame may be made to burn evenly, in combination with a single slotted cone.

Claim.—First, the employment of two or more wicks, arranged and operating as shown and described, in combination with the single slotted cone, substantially as and for the purposes herein specified and shown.

Second, providing the wick tube with the partitions a' , as and for the purposes specified.

Third, the combination of two or more wick regulators E' and F , as shown and described.

No. 46,364.—JOHN F. KELLER, Greencastle, Penn.—*Seed Planter.*—February 14, 1865.—In this machine a solid roller is used in combination with an elastic roller in the seeding device; between the rollers is fitted an adjustable gauge piece with a point fitting down between the rollers, and just above, a cast-iron slide fitting also accurately to the rollers.

Claim.—First, the above-described inelastic roller, in combination with the elastic roller, as a pair of feed rollers for wheat drills or other seed planters, substantially as set forth.

Second, the peculiar adjustable gauge piece H , the same being provided with a point fitting down between the tops of the feed rollers, substantially in the manner and for the purposes set forth.

Third, the solid or cast-iron slide with tips or points fitting down between the tops of the rollers, substantially in the manner specified.

No. 46,365.—SETH KINMAN, Humboldt, Cal.—*Arm Supporter for Riflemen.*—February 14, 1865.—This supporter is strapped around the body, and is capable of several adjustments to suit the varied size of the wearer. The vertical piece is rigidly attached to the waist belt, and the one supporting the elbow, which is strapped to it, having a perfectly free movement, suitable to the natural motion of the person's arm. When desirable, this can have a bearing against the vertical piece, thus forming a firm support or rest to steady the arm when firing. It can be unshipped by the slightest movement of the arm.

Claim.—First, an arm supporter and rest, constructed and operating substantially as herein set forth and described.

Second, the combination of the base or band A and bars E and F , constructed as described.

Third, the bar F , provided with an arm piece D , and jointed to a support E in such a manner that said bar may be fixed as a rigid support for the arm or made to vibrate freely, as required, substantially as set forth.

No. 46,366.—J. W. LATCHER, Northville, N. Y.—*Railroad Car Brake.*—February 14, 1865.—In the operation of this brake the greatest strain required to stop the wheel acts upon each end of single pieces of an iron plate or shoe, secured upon the inside of said plate, and, owing to the concavity of the shoes corresponding with the convexity of the wheels, it will not fall upon the track, should some one of its minor parts give way, as in the case of the ordinary brake.

Claim.—First, the employment or use of the rocking or oscillating plates B B, placed on suitable centres, and longitudinally to the truck, and centrally between and in front of the wheels, and actuated by means of the links C C toward each other and against the wheels, in the manner and for the purpose substantially as described.

Second, the use of the toggle links C C, in combination with plates B B, for the purpose of rocking or actuating the plates B B, as set forth.

No. 46,367.—JOSEPH F. LETELLIER, Grand Rapids, Mich.—*Water Wheel.*—February 14, 1865.—The novelty of this invention consists in having the scroll and buckets arranged angularly in such a manner that the water will act upon the wheel nearer to its periphery than in the ordinary wheels of similar construction, the object being to produce a greater mechanical effect by giving a greater leverage, and to facilitate the discharge of the water from the wheel.

Claim.—A horizontal water wheel, provided with a scroll, having its bottom formed of a spiral plane longitudinally, and inclined transversely, in combination with the inclined buckets of the wheel, all arranged substantially as herein set forth.

No. 46,368.—WM. A. LIDTHALL, New York, N. Y.—*Condenser and Refrigerator.*—February 14, 1865.—This invention consists in the arrangement of the nozzles for the induction of the injection water to be cooled, and of the sea water for cooling it, in such a manner that the water to be cooled shall be made to pass across and around the outside of the tubes, while the cooling water passes through them in contradistinction to the reverse of this operation.

Claim.—The combination of the case A, tubes B, and division plates C, with the nozzles D and E, for the reception and delivery of the cooling water, when the nozzles F and G, for the reception and delivery of the injection water, when the said nozzles are arranged in relation to each other and to the case, tubes, and division plates, as and for the purpose herein set forth.

No. 46,369.—THOMAS M. LOZIE, Elmira, N. Y.—*Stove-pipe Thimble.*—February 14, 1865.—This invention consists of a stove-pipe thimble, composed of a series of rings, and a register, fitted together by hooks or projections and corresponding nicks.

Claim.—A stove-pipe thimble, composed of a series of rings B C D and register E, fitted together by hooks or projections *d c f* and corresponding nicks *d e f*, substantially as and for the purposes set forth.

No. 46,370.—JOHN H. MABBITT, Mechanicsville, N. Y.—*Machine for Making Wrought-iron Railroad Chairs.*—February 14, 1865.—This machine is intended to make railroad chairs out of plates of wrought iron of the kind described in the said Mabbitt's patent, dated December 2, 1862, and comprises a movable cutting and punching die, working in conjunction with a permanent lower die and a movable die, working within it—the movable dies working vertically, and operated, the former by an eccentric wrist pin in the end of a shaft, and the latter by a cam. In its operation a rectangular piece is first cut out of the plate, and then, the lower movable die receding out of the way, the upper die continues to descend, shearing the metal back from each angle of the opening previously made by the punch, and, by virtue of its peculiar shape, bending the portions thus sheared back against the inner surface of the permanent die, giving to the two tongues thus formed the proper curvature.

Claim.—The employment of the said upper and movable die F, and the said lower and fixed die E, and said vertical-moving centre die C operating within said fixed die E, each constructed and combined in the manner and for the purposes substantially as herein described and set forth.

Also, the said vertical-moving centre die C, in combination with the said lower and fixed die E and with the cam D, in the manner and for the purposes substantially as herein described and set forth.

Also, the cutting and punching in the said prepared chair plate or bar the said plate or recess by means of the said die or punch *e*, or its equivalent, so as to allow the said inner and outer lips to be cut, punched, swedged, and formed from said chair plate or prepared bar in a more quick, easy, and substantial manner, substantially as herein described and set forth.

Also, the combination of the cam or eccentric D with the moving vertical centre punch or die C, substantially in the manner and for the purposes herein described and set forth.

No. 46,371.—HENRY F. MANN, Pittsburg, Penn.—*Machine for Rolling Metal.*—February 14, 1865.—This machine consists of two supporting rolls, arranged with their surfaces in contact with rolls of smaller diameter, and placed above the upper roll of small diameter and below the lower one, for the purpose of supporting rolls of small diameter for rolling metallic sheets, bars, or plates.

Claim.—The use of two supporting rolls, or their equivalent, placed with their surfaces in contact with small diameter-working rolls placed above the upper small diameter-working

roll and below the lower one, whether an intermediate roll of larger diameter is used or not, for the purpose of supporting working rolls of small diameter for rolling metallic sheets, bars, or plates, substantially in the manner hereinbefore described.

Also, the use of two small diameter rolls, in combination with an intermediate roll of larger diameter, the small diameter rolls being supported as hereinbefore described, the term small diameter being used relatively to the diameter of the larger roll, and not as otherwise limiting or defining the diameter of the smaller rolls.

No. 46,372.—F. B. MARBLE, Columbus, Ohio.—*Machine for Dressing the Throats in Plane Stocks*.—February 14, 1865.—This invention consists in the combination of a rotary travelling cutter, with an oblique adjustable rest and clamp. Upon the vertical face of the rest is a gauge. A rotating planing cutter is also employed, having cutting edges on its periphery and on its face, and used in connection with an adjustable stop gauge applied to the frame.

Claim.—First, the combination and arrangement of the rotary travelling cutter N and oblique adjustable rest and clamp *j t*, substantially as and for the purposes described.

Second, the application of the gauge *k* to the vertical face of the pivoted rest of a machine for planing the throats of plane stocks, substantially as and for the purposes described.

Third, the rotating planing cutter N, with cutting edges on its periphery and on its face, arranged and operating substantially in the manner and for the purpose described.

Fourth, the combination in a machine for cutting the throats of plane stocks, of the rest *j*, gauge *k*, clamp *t*, horizontally adjustable bed H, vertically adjustable table G, and a travelling cutter, constructed and operated substantially as described.

Fifth, the pivoted adjustable clamping rest and gauge *j k t*, constructed and operated substantially as and for the purposes herein described.

Sixth, the adjustable stop gauge *c*, applied to a frame A, in combination with a travelling rotary cutter N and stock-holding bed H, substantially as and for the purpose described.

No. 46,373.—CHAS. W. and WM. W. MARSH, Clinton, Ill.—*Harresters*.—February 14, 1865.—This invention relates to that class of machines which employ an endless apron arranged behind the cutting apparatus to receive the grain as it is cut, and by the rotation of which the grain is discharged at the stubble end of the cutting apparatus. It consists in the employment, in connection with such belt or apron, of a scalloped gatherer attached to the frame-end of the finger-bar, and provided with a hinged extension reaching back over the inner end of the belt, for the purpose of laying the straws evenly thereon; a peculiarly constructed scraper being employed to keep the apron-rollers clear of obstructing straws, &c.

Claim.—The scalloped gatherer D, provided with the hinged extension *d*, as described, when used in connection with the band B, substantially as and for the purpose specified.

Also, the scraper E for the roller C, when constructed as described, and used with the endless band B, for the purpose specified.

No. 46,374.—JOHN M. MAYER, New York, N. Y.—*Machine for Hulling and Cleaning Grain*.—February 14, 1865.—This invention consists in a revolving wire-gauze cylinder, provided with a series of circular rough surface shelves, in combination with an internal fan blower, and with an external case, provided with a series of semicircular conduits, arranged in such relation to the circular rough surface shelves of the wire-gauze cylinder that the wheat or other material dropped in the first shelf passes to the second and third, from the third to the fifth, and so forth, and from the second to the fourth, and so on, and in its course over the several rough surface shelves it is thoroughly divested of its peel, and discharged in a comparatively pure state.

Claim.—The revolving perforated cylinder A, with circular shelves E, in combination with the semicircular conduits *d* and case F, constructed and operating substantially as and for the purposes set forth.

No. 46,375.—A. S. MCINTIRE and NATHANIEL STEVENS THOMPSON, Stoneham, Mass.—*Toe Piece for Lasting Machine*.—February 14, 1865.—This invention, relating to a mode of forming the toe piece of gutta-percha, or other similar substance, in a pliable state, consists in using a part of the lasting machine and an unfinished shoe on the last for a mould.

Claim.—The method of forming a toe piece for lasting machines of any suitable material, by means of the lasted shoe and the jaw lasting machine, substantially and for the purpose as herein described.

No. 46,376.—ELIAS MINNICH, McKee's Half Falls, Penn.—*Cultivator*.—February 14, 1865.—This invention consists in two oblong hoes or shares attached to upright supports that turn on pivots in the cultivator frame; these supports are braced to the tongue at their front and rear ends, and by lengthening or shortening either brace the shares are set at a greater or less angle. In combination with the shares are two long curved steel teeth or rakes for clearing away weeds.

Claim.—The arrangement of the braces M M, connecting the ploughshares to the tongue, with the teeth or rake L, as arranged and combined with the angular-shaped frame E, as herein described and for the purposes set forth.

No. 46,377.—THOS. S. MINNISS, Meadville, Penn.—*Mode of Hanging Gates*.—February 14, 1865.—In this invention the gate is suspended by means of a pulley resting upon a rocking beam or way. This rocking beam is tilted by means of a cord at either end, which causes the gate to run off to one side and thus open a passage; by releasing the hold upon the cord, and pulling at the opposite end, the gate closes by its own gravity.

Claim.—The gate A, shifting lever I, and cords O, the several parts being constructed, arranged, and operating as and for the purpose set forth.

No. 46,378.—SAMUEL H. MITCHELL, El Paso, Ill.—*Gang Plough and Cultivator*.—February 14, 1865.—This invention consists in making the split ends of the draught-pole serve as parts of the frame. The split ends are fastened upon the axle, and have three parallel bars fastened to them; two in front for fastening the ends of the plough-beams, and one in the rear for lifting the ploughs by its rotation.

Claim.—The split and expanded draught-pole C, in connection with the axle A and bar E and O and rods *h*, all arranged as and for the purpose herein set forth.

No. 46,379.—H. B. MYERS, Schoolcraft, Mich.—*Self-setting Animal Trap*.—February 14, 1865.—In this invention a tilting platform is operated by pulling at the bait. The animal is let into a receptacle below, whilst the trap is reset by a pendulous detent having guide grooves in it, bringing the platform to its normal position.

Claim.—The combination of the pendulous detent E, provided with the groove or channel *h i h*, and resetting itself by its own gravity with the fixed bait hook *d*, the weighted platform, and the box of the trap, substantially as above described.

No. 46,380.—THOMAS J. NEWLAND, Utica, N. Y.—*Locomotive Head Light*.—February 14, 1865.—This invention consists in the combination and arrangement of four hollow cylinders, the inner one having bevelled ends to facilitate the delivery of the air to the point of combustion in connection with a mode of elevating and lowering the wick.

Claim.—The combination and arrangement of the barrels or cylinders A B C and D, used and operating substantially in the manner and for the purpose mentioned.

Also, the bevelled ends of the inner cylinder D, separately and in combination, used and operating substantially in the manner and for the purposes mentioned.

No. 46,381.—AMBROSE J. NICHOLS, Providence, R. I.—*Expansible Reed for Warp Dressing and Weaving*.—February 14, 1865.—The object of this invention is to adapt the reed to the different lengths of the beams. The ribs are made of India-rubber or other elastic material and are sustained and guided in grooves in the longitudinal rails of the frame. By turning the screws the crossbars are drawn up against the end rails of the frame; the ribs are lengthened, and the darts are spread, and *vice versa*.

Claim.—The combination of the crossbars *c c*, and screws *e*, with the elastic ribs *a a* and grooved frame A, all constructed and arranged as and for the purpose herein specified.

No. 46,382.—MARCUS ORMSBEE, New York, N. Y.—*Picture Frame*.—February 14, 1865.—This invention consists in punching or cutting tongues in a sheet-metal, back so that they can be used as supports to sustain the frame in any particular position.

Claim.—The flexible plate forming the back of a picture frame, in combination with the tongues or lips cut out of and made from the back or plate to form attachments or supports to the picture, substantially as herein described.

No. 46,383.—IRA A. PALMER, Monmouth, Ill.—*Cultivator*.—February 14, 1865.—This invention consists in making the frame of V-shape to render it light and strong; also in a draught equalizer formed of two rods with arms at right angles, throwing the whiffletrees outside the rods; and also in attaching the plough beams with a vertical adjustment to a short perpendicular wooden bar, turning on a pivot, so as to be adjusted laterally.

Claim.—First, the draught equalizer composed of the rods D D, provided with arms *d d'* at their upper and lower ends, and placed at right angles to each other, with the lower arms projecting at right angles from the machine, with the upper arms *d* connected by a rod E, and the whiffletrees attached to the lower arms *d'*, substantially as and for the purpose set forth.

Second, connecting the plough beams E to the bars *c* of the main frame A, through the medium of the bars *k*, which work on adjustable pins or rods *l*, in plates *m*, attached to the bars *c*, and the pins *j*, which pass through plates *i*, attached to the plough beams and through the bars *k*, all being arranged substantially as and for the purpose specified.

Third, the particular manner of constructing the main frame A, to wit, of the side bars *a a* arranged in V-form, connected at their upper ends by crossbars *b b*, and mounted on wheels B, substantially as herein set forth.

No. 46,384.—DANIEL L. PRATT, Bridgeport, Ohio.—*Manufacture of Sheet Iron*.—February 14, 1865.—This invention consists in immersing the sheet metal in a bath composed of a mixture of organic and inorganic acids, the solution being heated to 150° Fah., and the metal remaining therein from three to twelve hours. The metal is then taken from the bath,

washed and scrubbed, and immersed in an alkaline solution consisting of water and carbonate of potash, the said bath being also heated to 150° Fah. The metal is then taken out and passed between two wheel brushes, jets of water being thrown upon each brush during the operation, after which it is heated until perfectly dry. It is then placed in a bath of animal oil at 100° or 150° Fah., and allowed to remain ten or fifteen minutes, when it is taken out and dripped, and passed between two polished chilled iron rollers, after which it is passed between wooden rollers covered with leather, the sheet being dusted during the operation, with powdered chalk or brick dust. It is then colored by being placed over a bed of burning charcoal until it acquires the requisite shade.

Claim.—First, the herein described series of processes, substantially as described.

Second, subjecting the sheet iron, after it has been cleansed of its scale and of the operating chemicals and water, to a bath or coating of oil, which is rolled in cold, or at a temperature that will not dissipate the oil.

Third, subjecting the sheet, after it has been removed from the bath of alkaline solution, to the action of revolving brushes, upon each of which a jet or stream of water is thrown.

Fourth, the combination of an organic and mineral acid in the acidulous bath, substantially as described.

No. 46,385.—THOMAS E. PURCHASE, Reading, Penn.—*Retaining and Releasing Hooks.*—February 14, 1865.—This invention consists of a retaining and releasing hook, to the body of which is connected a pawl and spring lever, the whole being constructed so that the object retained by the hook may be instantly released on striking the said spring lever.

Claim.—The within described retaining hook, consisting of a body A, pawl E, and spring lever B, all constructed and arranged substantially as set forth.

No. 46,386.—THOMAS PYE, New Hartford, N. Y.—*Spinning Machine.*—February 14, 1865.—The object of this invention is to relieve the hand labor of the spinner in running up the jack and tightening the threads to make a hard bobbin; and also to save the belt from the wear of abrasion on the tight pulley when that pulley is stationary. The belt is designed to be kept entirely from the tight pulley, while adjusting the thread on the bobbins preparatory to winding up, and then partially thrown back to assist in the return of the jack, thus relieving the operation from friction when not needed, and restoring so much of it as is useful when required.

Claim.—The improvements in the operations of the spinning jack in woollen manufactories, as I have described it, consisting of the levers *a c* and *d*, the slide bolts *n* and *x*, and the lifter A O, figure 1, the weight and lever D E, figure 2, and the sheave *t*, figure 3, with their connections, adjustment, and adaptation, as described, and for the purposes described, the whole being arranged, combined, and operating substantially in the manner herein set forth.

No. 46,387.—PETER RAUCH, South Lebanon, Penn.—*Mode of Curing Tobacco.*—February 14, 1865.—This invention consists in the employment of a nest of three rectangular boxes, each having perforated slides. The tobacco is placed in the smaller or inside box, to which a screw is attached for the purpose of pressing the tobacco. The ventilation is regulated by the perforated slides.

Claim.—The mode and manner of regulating and ventilating the curing of tobacco by the single or double ventilating boxes and packing, as herein described, and for the purposes set forth.

No. 46,388.—GEORGE M. RAMSEY, New York, N. Y.—*Railroad Rail Joint.*—February 14, 1865.—This invention consists of a joint for connecting the end of railroad rails so contrived as to be readily removable, and at the same time to afford a firm bearing for the tread of the wheels, and to prevent the depression of one end of a rail below that next to it.

Claim.—The combination of the mitre or lap joint, together with the clamp, substantially as described.

Also, making the slot A *a* longer than the union *c*, substantially as described.

Also, making the ends *b b* to extend beyond the end of *c*, substantially as described, for the purposes described.

No. 46,389.—J. H. RAYMOND and W. J. BRASSINGTON, Brooklyn, N. Y.—*Self-locking Nut.*—February 14, 1865.—This invention consists in inserting in a slot in the edge of a nut a pointed cam or pawl, which, by tightening the nut, offers no resistance, but when turned in an opposite direction bears upon the surface of the screw bolt, and prevents its further motion in that direction. By inserting a tapering pin in front, and forcing back the cam, it relieves its hold of the bolt and allows the nut to be unscrewed.

Claim.—First, the dog C, so applied within the nut and held in contact with the screw thread of the bolt by a spring that by any tendency to turn the nut in one direction the friction of the said dog on the surface of the said thread is caused to draw its point toward the centre of the bolt, and so make it bite the thread at any part of its surface, substantially as herein described.

Second, the hole *e*, in combination with the dog C and the slot *a* in the nuts, substantially as and for the purpose herein specified.

No. 46,390.—EDWIN REYNOLDS, Mansfield, Conn.—*Lithographic Printing Press*.—February 14, 1865.—In this invention the improvements are various, and apply to that kind of press in which there is an oscillating bed vibrating through the arc of a circle, a rotary tympan, and revolving ink rollers. The claim mainly sets forth the nature of the invention.

Claim.—In combination with an oscillating carriage, through which movement is imparted to the stone to ink its surface and to carry it under the tympan, and rotation is imparted to the tympan, the construction of the oscillating gears by which the tympan is kept in contact with the stone as they move in juxtaposition, when this construction is combined with mechanism which arrests the motion of the tympan, or locks it in position during the back movement of the stone.

Also, the arrangement of the mechanism for connecting the tympan gears with the tympan frame for the forward movement of the stone, and disconnecting them for the back movement of the stone, substantially as set forth.

Also, so arranging this clutching mechanism that the tympan frame can be disconnected from the tympan gears for the entire back and forth movement of the stone.

Also, so constructing the tympan frame that while one end of the tympan is stationary, with respect to the tympan cylinder, the other end is attached to a yielding bar, for the purposes substantially as described.

Also, constructing the rotary tympan frame with an open space between its two parts *l* and *k* to permit access to or removal of the scraper when the tympan is in position to bring such space beneath the scraper, substantially as shown and described.

Also, when a series of three or more ink-rollers is employed, such disposition and application of them with reference to the path of movement of the stone and the position of the main ink cylinder, that while the rollers are brought into position to rotate in contact with the flat surface of the stone as it traverses beneath them, they shall also be carried at proper times, by a series of concentric bearings, into positions around and in contact with the curved surface of the main ink cylinder, substantially as described.

391 No. 46,139.—JOHN RICHARDS, Columbus, Ohio.—*Machine for Mortising Plane Stocks*.—February 14, 1865.—The object of this invention is to mortise the front and rear ends of the throats of plane stocks, and it consists of a rotating boring tool, having a vibrating motion equal to the length of the width of the throat, and a hinged clamp with a gauge so arranged as that the stock can be held in the required position, and can be adjusted and set to any angle desired while being bored, the carriage being fed up to the tool by means of a spur wheel gearing into a rack on the under side of the carriage, operated by a lever attached to the end of shaft.

Claim.—First, the combination of an adjustable inclined stock holder *F* with a boring tool which receives a rotary motion and at the same time a vibrating motion, substantially as described.

Second, the construction of the stock support *F*, in combination with the bed *G* and clamp *S'*, substantially in the manner and for the purpose set forth.

Third, a gauge *p*, applied to the face of the stock holder of a machine adapted for cutting the throats in plane stocks, substantially as and for the purpose set forth.

Fourth, the combination of the stock *F*, adjustable clamp *s*, and rotary auger, substantially as and for the purpose set forth.

No. 46,392.—JOHN RICHARDS, Columbus, Ohio.—*Machine for Mortising Plane Stocks*.—February 14, 1865.—The object of this invention is to mortise by machinery the sides or cheeks of the throats of the plane stocks, and it consists of a rotating boring tool that has a vibratory motion equal to the length of the mortise to be cut, and a double inclined carriage, with gauges and clamps to hold the stock in position while being bored, the carriage being fed up by means of a lever attached to a shaft on which is a spur wheel gearing into a rack on the under side of the carriage.

Claim.—First, producing the cheeks on each side of the throat of a plane stock by means of a rotary vibrating auger operating in conjunction with a double inclined bed *F*, which is adapted for holding the stocks in a proper position to receive the auger, substantially as described.

Second, the stock holding bed *F*, constructed with double inclined surfaces *h h'*, and provided with gauges and clamps for holding the work in place during the operation of forming the cheeks, substantially as described.

No. 46,393.—JOHN L. RIPLEY, Frémont, Ohio.—*Horse Hay-forks*.—February 14, 1865.—This invention relates to the device for locking or fastening the fork, and will be readily understood from the claim and drawing.

Claim.—The bolt *E* attached to the spring *H*, and having the rod *F* connected to it by a pivot *d'*, in combination with the inclined plate *I* and the curved part *b* of the bar *D*, all arranged to operate substantially as and for the purpose herein set forth.

No. 46,394.—E. P. RUSSELL, Manlius, N. Y.—*Harvesting Machine*.—February 14, 1865.—In this machine the cutting apparatus is hinged to the draught frame by means of an angular draw bar, which serves also as a hinge and brace for the cutting apparatus, combined with a

curved sliding hanger, the parts being applied to the draught frame so as to render a single hinge joint in the cutting apparatus or its connections capable of serving "double hinge." With the curved sliding hanger is combined a curved slotted bearing guide, constructed in one piece and applied to the main frame, and upon the said hanger is formed a curved stop tooth combined with a curved lip on the shoe.

Claim.—First, hinging the cutting apparatus to the draught frame by means of an angular draw bar, which answers also as a hinge, *i*, and brace for the cutting apparatus, in combination with the curved sliding hanger *C*, the said parts being applied to the draught frame, substantially as shown, for the purpose of rendering a single hinge joint in the cutting apparatus or its connections capable of serving the purpose of what is known as the "double hinge" or "double rule joint," as set forth.

Second, the curved slotted bearing guide *B*, constructed in one piece and applied to the main frame, as described, in combination with the curved stiff hanger *C*, arranged and operated as set forth.

Third, the construction of the curved stop tooth *b*, formed on the hanger *C*, in combination with the curved lip *g'*, constructed as shown, on the shoe *F*, substantially as and for the purpose described.

Fourth, the transverse rigid brace and guide *D*, in conjunction with the curved hanger *C* and curved guide *B*, substantially as and for the purpose set forth.

Fifth, the manner shown of applying the roller *a* within the eye of the curved guide *B* and upon the curved hanger *C*, for the purpose set forth.

No. 46,395.—WILLIAM B. SCAIFE, Pittsburg, Penn.—*Brazing Brass Screws to Iron Pipes.*—February 14, 1865.—This coupling is formed in two sections, constructed so as to be screwed together, each section being provided with holes or apertures through which melted solder or other material may be poured in order to cement or permanently attach said sections to the pipes respectively, which are to be coupled together.

Claim.—As an article of manufacture a tubular coupling in two sections, constructed so as to be screwed together, each section being provided with holes or apertures through which melted solder or other material may be poured in order to cement or permanently attach said sections to the pipes respectively, which are to be coupled together.

No. 46,396.—JAMES SCOUER, San Francisco, Cal.—*Photographic Camera Stand.*—February 14, 1865.—This invention consists in having a frame on which the camera rests, made to slope at any desirable angle by means of a ratchet and spring pawl, by an arrangement of hand lever to elevate the instrument, and by a set screw for nice adjustment, all within convenient reaching distance of the operator.

Claim.—First, the skeleton platforms *C C'*, connected to each other by a hinge joint *b* and to the frame *A* by a hinge *a*, to operate in combination with the spring pawls *D D'* and serrated bars *E E'*, in the manner and for the purpose substantially as described.

Second, the hand lever *G* and bottom *J*, in combination with the platform *C* and pawl *D*, constructed and operating substantially as and for the purpose set forth.

Third, the adjustable serrated bar *D'*, in combination with the platforms *C C'* and set screw *d*, constructed and operating as and for the purpose set forth.

No. 46,397.—JOHN B. SICCARDI and JAMES HYDE, New York, N. Y.—*Comb for combing Wool, Flax, Cotton, &c.*—February 14, 1865.—The claim and drawing convey a clear idea of this invention.

Claim.—The construction of a comb with metal points or teeth, when said teeth are passed through holes made in the plate *I* and secured at its back by means of a suitable cement, the whole being constructed in the manner substantially as described and specified.

No. 46,398.—J. N. SMITH, Galva, Ill.—*Corn Planter.*—February 14, 1865.—In this machine the seed boxes and furrowing devices are attached to the rear of the machine in such a way that the driver, by a hand lever and crank shaft, throws the seat forward and varies the depth of the furrow by his weight.

Claim.—Attaching the frame carrying the furrowing device and seed boxes to the forward end of the pivoted frame *A*, so that by the forward or rear movement of the driver's seat by means of the lever *g*, crank shaft *p*, and carriage *m*, the weight of the driver may be made to partially counterbalance the weight of the forward frame and modify the depth of the furrow.

No. 46,399.—JOSIAH T. SMITH, Springfield, Ill.—*Brick Machine.*—February 14, 1865.—This invention consists in the combined arrangement of the pulverizer mould, or plunger, with a cam, in discharging the bricks from moulds downwards, and in the movement of the bottom across the face of the plungers removing the brick.

Claim.—First, the combined arrangement of the pulverizers, moulds, or plungers, and the cam motion, for the purposes as substantially set forth.

Second, discharging the brick from the moulds downward, being the mode in which they are pressed, thus avoiding derangement in the particles of clay, leaving the brick as smooth and perfect as when pressed.

Third, the movement of the bottom across the face of the plungers, removing the brick, and perfectly cleansing the face of the plungers of any particles of clay which might adhere to them.

No. 46,400.—CHARLES SPOFFORD and W. S. BELL, Jr., Boston, Mass.—*Machine for Stretching Paper Collars*.—February 14, 1865.—This invention consists in a perpendicular frame, in front of which is a table curved from its two sides downward, and at its inner end a block is so adjusted as to leave a narrow space between its lower rounded side and the surface of the table for the collar to pass curved in the direction of its length, to correspond with the surface of the table. Behind this block and the end of the table, which are in line, a smooth plate moves vertically, being divided into two sections by a line of light curvature, the sections parting by automatic means when this line is coincident with the surface of the table to receive the band part of the collar, which is immediately clamped; the rest of the collar is then drawn upward between the sliding plate and the rear part of the block, being also pressed by the roller above the block and thus distended so as to fold over the band part without creasing.

Claim.—The sliding carriage E, with its curved recess *d*, in combination with the stationary block I and cylinder L, operating substantially as set forth for the purpose specified.

No. 46,401.—EDWIN C. STILES, Portland, Me.—*Milling Machine*.—February 14, 1865.—This device consists of two dies, one concave, and formed on the end of a slide mounted upon a suitable platform or frame, and adjustable by means of a set screw towards or from another die with a corresponding convex face; the latter is formed on the short arm of a lever, which, by being thrown to one side, permits the head of the screw which is held in a vertical position to be inserted between the two dies, then by operating the lever in an opposite direction, the head is caused to roll between and in contact with the two dies until it is released by the movable one passing beyond the other.

Claim.—First, producing an elastic bearing for the counter die C, or its equivalent, by means of the spring J and its set screw *d*, substantially as described.

Second, in machines for milling screw heads and other articles causing the curved face of the vibrating die B to operate in connection with the concave face of the adjustable counter die C, substantially as described.

No. 46,402.—BERNHARD L. STONE, San Francisco, Cal.—*Burglar Alarm*.—February 14, 1865.—This invention consists in the employment of a clock train provided with an alarm bell, which is set by a catch over the top of a door. When the door is opened a spring bolt liberates the catch and starts the alarm.

Claim.—The arrangement of the hammers B and C, the invention of lever G and spring H, as arranged, together with the arrangement of the triangle I as attached to lever wire G, and extending from one end of the triangle I and a wire or cord Q, which is fastened to the other end of the triangle I and extends to cap K, which is also claimed as a new invention, together with the arrangement and operation of the spring door bolt L, which, by throwing off the cap K, sets the alarm in operation. The alarm continues until the machine runs down.

No. 46,403.—ASAHEL TARBOX, Willimantic, Conn.—*Water Elevator*.—February 14, 1865.—This invention consists in a shaft operated by a crank, which has its fulcrum upon an inner ratchet wheel, by means of a lateral dog on the crank. The eye of this crank is of ovoid form so as to bring the dog out of contact with the ratchet wheel when the hand of the operator is removed and the handle falls. The brake lever is pivoted a short distance from the cylinder, a semicircular part passing under the cylinder to be pressed upward against it. A dog inclines laterally from the lever, between the cylinder and the pivot fulcrum, so as to engage with another ratchet wheel and hold the cylinder, except when released by the hand of the operator.

Claim.—First, the combination with a rotating shaft of a loose crank which can be alternately connected with and disconnected from the shaft on which it is hung by means of its enlarged eye and a dog on the side of the crank, substantially as above described.

Second, in combination with a crank constructed and operating as above described, the brake apparatus, consisting of the lever D, its detent D², its brake D¹, and the ratchet wheel *a* and friction ring *b*, substantially as above set forth.

No. 46,404.—J. THOMPSON, New York, N. Y.—*Cigar Machine*.—February 14, 1865.—This invention consists in an adjustable mould, in combination with a longitudinally-sliding fork, in such a manner that the filler can be readily placed in the mould and presser, and by the action of the revolving fork the wrapper can be applied while the filler is in the mould.

Claim.—The adjustable mould C, in combination with the longitudinally-sliding revolving fork D, constructed and operating substantially as and for the purpose set forth.

No. 46,405.—ISAAC P. TICE, New York, N. Y.—*Mode of Manufacturing Paper Twine*.—February 14, 1865.—The claim defines the invention, and the engraving illustrates a mode of operation.

Claim.—The manufacture of paper twine by twisting the paper in a dry state, afterwards moistening it, and subjecting it to a stretching operation while in a moist state, substantially as herein described.

No. 46,406.—GEORGE W. TOLHURST, Circleville, Ohio.—*Mop*.—February 14, 1865.—This invention consists in providing the mop cloth with two handles, and so connecting them with a link or hinge that as the mop cloth is drawn into a wringing position the handles shall be separated by the link, to allow one cross-piece of one of the handles to turn without coming in contact with the other handle.

Claim.—The combination of the handles A A', cross-pieces B B', and brace D, substantially as specified.

No. 46,407.—ASA M. TOMB, Lyons, N. Y.—*Machine for Polishing Marble*.—February 14, 1865.—This invention consists in producing a machine capable of polishing marble or other stone automatically. The surface is polished of any desired length or breadth without the attention of an operator, the machine being regulated and capable of adjustment to the various circumstances in which it is employed.

Claim.—The combination and arrangement of the sliding block K, way G, shaft L, double pulleys n n, and the band F, wound around said pulleys on opposite sides in such a manner that while said sliding block is allowed a free reciprocating motion, without unusual friction, the shaft is revolved by the band, substantially as herein set forth.

Also, the hinged way G, so arranged as to swing aside to enable the stone to be adjusted on the carriage and to serve as the guide to the sliding block K, substantially as herein described.

Also, the polishing device, consisting of the head M, radial arms s s, and jaws t t, so arranged that each set of jaws can be adjusted at varying distances from the head, substantially as and for the purpose herein specified.

Also, connecting the head M with the shaft L by means of the depressions q q q and arms o o, in such a manner as to produce a free joint, so that the polishing device will adapt itself to the surface of the stone, substantially as herein described.

Also, shifting the engagement of the pinion f' with the pinion g' h' by means of the bar N, provided with cam i', the dogs o o, and the shaft k', provided with the pins r, crank and weight n' o', and cams m' m', the whole arranged, combined, and operating substantially as herein set forth.

Also, the holes s' s' in the carriage B, and the shifting pins u' u', when used in combination with the rack r', pinion q', and shaft k', for gauging the stroke of the carriage to the length of the stone, substantially as herein set forth.

No. 46,408.—WILLIAM H. TOWERS, New York, N. Y.—*Shoestring*.—February 14, 1865.—This invention consists in cutting shoestrings from raw or untanned hides, and making them soft and pliable, the ends being impervious to moisture and pointed ready for use.

Claim.—The improved shoestring or lacing made from raw or untanned hide, with the ends made impervious to moisture and pointed ready for use, substantially in the manner and for the purposes above described.

No. 46,409.—M. M. TURNER, North Fairfield, Ohio.—*Method of Finding Waist and Chest Measurement of Ladies' Dresses*.—February 14, 1865.—This method includes the use of a chart, shown and described, a knowledge of which, by the aid of the specification, is essential to an understanding of the invention.

Claim.—The method of finding the waist and chest measurement, substantially as described.

No. 46,410.—J. T. WARREN, Stafford, N. Y.—*Knapsack Slings*.—February 14, 1865.—This invention consists in the construction of metallic slings, having a back strap below and yielding straps or loops above, attached to the knapsack, to conform to the shape and size of the shoulders.

Claim.—The arrangement and construction of the metallic slings E E, with their yielding straps D D and back strap G, as herein described and for the purposes set forth.

No. 46,411.—MARTIN V. B. WHITE, Troy, N. Y.—*Cartridge-box*.—February 14, 1865.—The cartridge-box, which is of a narrow, elongated, and curved form, adapted to the side of the soldier, is provided with an apron at its bottom, upon which the cartridges are placed standing in one or more rows, the said apron having at its rear or inner end a flange or upright lip to enclose the back end of the series of cartridges, and being attached at its forward end to a coiled spring, by which the cartridges are constantly pulled forward, so as always to present one at the front opening of the box.

Claim.—The employment of the apron E, with the vertical end piece I thereto attached, in combination with the inner box B and the coil spring D, in the manner and for the purposes substantially as herein described and set forth.

Also, the employment of the inner case B in combination with the outside case A, substantially as and for the purposes herein described and set forth.

Also, the removing of cartridge from the one end of the cartridge-box in the manner and by the means substantially as herein described and set forth.

No. 46,412.—**RICHARDSON WILSON**, Fowler, N. Y.—*Wheeled Plough*.—February 14, 1865.—In this invention the larger and smaller supporting wheels are placed upon vertical adjustable supports, the support of the larger wheel being also adjustable laterally.

Claim.—The arrangement of the vertical adjustable supports D J with regard to the beam E and the axles of the supporting wheels A H, as and for the purpose herein described and represented.

No. 46,413.—**GEORGE B. WINSHIP**, Boston, Mass.—*Graduated Dumb-bells*.—February 14, 1865.—In this invention a mode of graduating the weight is accomplished by making the end weights in the form of flat disks, and fastening them on the handle with spring pins.

Claim.—First, constructing graduated dumb-bells of flat disks or sections, substantially as and for the purpose described.

Second, fixing the two inmost disks 1 1 upon the handle A by means of the holes *e* and the imbedded stationary pins *c c*, substantially as described.

Third, the method of confining the removable disks or sections by means of the spring pins D and holes *b*, substantially as and for the purpose described.

Fourth, constructing the handle A of a dumb-bell of a hollow metallic cylinder, substantially as set forth and for the purposes described.

No. 46,414.—**GURDON G. WOLFE**, Troy, N. Y.—*Stove-pipe Ventilator and Draught Damper*.—February 14, 1865.—This invention consists of a vertical register combined with a damper in such a manner that they may be operated independently of and separately from or with the register, as may be desired.

Claim.—The employment and combination of the vertical register C with the damper E, in the manner substantially as herein described and set forth, so that the same may together be operated independent of and separate from or with the register C3, in the manner and for the purposes herein described and set forth.

No. 46,415.—**WILLIAM L. WOODS**, Washington, D. C.—*Paper Files*.—February 14, 1865.—This invention consists in so simplifying the form of the box to contain papers, &c., that it may be used in ordinary pigeon-holes, be ventilated, and cheap in construction.

Claim.—The file box, figures 1 and 2, in its combination with pigeon-holes or shelves in vaults, safes, and portable cases, substantially as set forth and described above.

No. 46,416.—**L. W. WOODWARD**, North Adams, Mass.—*Steam Trap*.—February 14, 1865.—This invention consists in a construction of steam traps in which the opening and closing thereof are caused by the alternate expansion and contraction of the pipe which forms the connection between the steam apparatus to be cleared of the water of condensation and the trap.

Claim.—The steam trap, constructed and operating substantially as above described.

No. 46,417.—**THEODORE YATES**, Milwaukee, Wis.—*Breech-loading Ordnance*.—February 14, 1865.—A yoke is pivoted to a projection on the under side of the gun, so that it may vibrate freely in a vertical plane, and by its vibration operate the mechanism, connecting it with the breech block in such a manner that the latter is elevated and the cap of the breech chamber withdrawn simultaneously, so as to permit the insertion of the cartridge. The latter having been inserted, the breech block is allowed to return to its place by gravitation, and in so doing operates a lever which closes again the cap of the breech chamber.

Claim.—The combination of the lever C C, cap D, and sliding breech block D, constructed and operating substantially as and for the purposes herein described.

No. 46,418.—**WILLIAM B. YOUNG**, Chicago, Ill.—*Plough*.—February 14, 1865.—This invention consists in forming the plough standard of a single piece of sheet iron or steel, bent or curved into the proper form, for the purpose of combining cheapness of manufacture with strength and lightness.

Claim.—A plough standard made of sheet iron or steel with upper part bent or curved, constructed and operating substantially as above described.

No. 46,419.—**EDWARD BEANS**, London, England, and **CONRAD WILLIAM FINZEL**, Bristol, England, assignors to themselves and **THEO. A. HAVEMYER**, New York, N. Y.—*Sugar Boiling*.—February 14, 1865.—This invention consists in the use of hot water at or near the boiling point, or steam of a pressure of one pound to the square inch, in vacuum pans for boiling sugar. In order to carry out this invention tubular vacuum pans, the tubes of which are reduced in length and increased in number according to the evaporating surface required, are used instead of the long tubular vacuum pans, or ordinary vacuum pans with worms.

Claim.—The employment or use in boiling sugar in vacuum pans of hot water at or as near as may be to the boiling point, or steam of a pressure of not more than one pound to the square inch, or as near as may be to that pressure, substantially as herein set forth, to prevent carbonization and coloring of the saccharine liquids and of the sugar.

No. 46,420.—CHARLES E. FOSTER, Philadelphia, Penn., assignor to the ROCK DRILL AND MINING COMPANY, Penn.—*Well-boring Apparatus*.—February 14, 1865.—This invention consists in combining a direct acting engine with the boring apparatus, so that the use of the usual walking beam and complex system of straps and gearing may be dispensed with.

Claim.—First, the combination, substantially as described, of one or more direct acting steam or compressed-air cylinders with a plate carrying the levers *h*, or their equivalents, and with a boring bar, for the purpose specified.

Second, the combination of the cylinder *C*, trunk *D*, levers *h*, or their equivalents, and bar *F*.

No. 46,421.—JAMES W. GRAY and CHARLES H. CURTIS, assignors to themselves and the SPRING PERCH COMPANY, Bridgeport, Conn.—*Machine for Straightening Elliptic Springs*.—February 14, 1865.—This invention consists in the combination of a sliding plate and jaw, operated by levers with cams and a spring, for the purpose of straightening the leaves or plates of carriage springs after they have been wrought or rolled out by a single operation.

Claim.—First, the combination of the sliding plate *a* and the jaw *d* with the table *A* and its rim *f*, constructed and operating substantially as and for the purpose above described.

Second, the combination of the levers which operate the jaw *d* and sliding plate *a* with the cams *C C* and the spring *E*, or its equivalent, all constructed substantially as above described.

No. 46,422.—R. LITTLE, assignor to himself and SAMUEL LITTLE, Canton Ohio.—*Improved Stove*.—February 14, 1865.—This invention is designed as an improvement upon a patent issued to the said Little June 12, 1864, and it consists in the application to the sides of his stove of removable reflecting plates, lined with bright metal, enclosing a small air space between the side of the stove and said plates, so arranged as to prevent the radiation of heat from the stove while cooking with it in summer, and in the winter the plates can be removed, and the room will be heated at the same time that culinary operations are conducted.

Claim.—The application to stoves of the removable lining plates *B*, substantially as and for the purposes described.

Also, the removable side linings *B* in combination with the closed sides *C* of the stove, substantially as herein described.

Also, the combination of the removable linings *B* of the stove with reflecting surfaces *S*, for the purpose of concentrating the heat on the stove, substantially as herein described.

No. 46,423.—JAMES PENKETH, assignor to himself and JOHN E. EASTMAN, Chicago, Ill.—*Furnace Doors for Boilers*.—February 14, 1865.—The object of this invention is to so join together the plates which form the furnace and outside boiler plate around the aperture for admission of fuel that the usual separate metallic ring is dispensed with, and the unequal expansion and consequent strain due to the necessary greater thickness of the ring thereby avoided. Its novelty consists in forming furnace openings through which fuel is passed by turning the boiler plate inwards and the furnace plate outwards, and lapping and riveting these plates together.

Claim.—Constructing the furnace doors of steam boilers by turning the boiler plate inwards and the furnace plate outwards, and lapping and riveting said plates together, substantially in the manner and for the purpose herein specified and shown.

No. 46,424.—THOMAS ROBJOHN, assignor to E. C. WOOSTER, New York, N. Y.—*Sewing Machine for Making Band Ruffling*.—February 14, 1865.—The claim, in connection with the drawing, sufficiently defines the nature of this invention.

Claim.—First, the combination with each other and with a sewing machine, of a guide for turning in the edges of and folding one strip of cloth to form a double band, a guide for guiding another strip of cloth into such band to form a ruffle, and a plaiting or ruffling knife, the whole operating substantially as herein specified.

Second, in combination with the ruffling knife, acting above the strip which is to form the ruffle, the extension of a portion of the bottom *i* of the guide *F*, or its equivalent, below the said knife, in such position as to be interposed between the ruffle strip and the lower part of the band, substantially as and for the purpose herein specified.

No. 46,425.—C. B. ROGERS, assignor to C. B. ROGERS & Co., Norwich, Conn.—*Sawing Machine*.—February 14, 1865.—This invention consists in arranging the feed rollers in movable frames, and applying a screw rod to operate upon these frames in such a manner that the rollers can both be adjusted together in a plane parallel to that of the saw. In connection with the above are combined pivoted arms, with a sliding cross-head and adjusting screw. Circular saws, of different diameters, may be used by mounting the saw arbor upon a longitudinally adjustable frame in connection with an adjustable guide.

Claim.—First, so arranging the feed rollers *C C* in movable frames *a a*, and applying a screw rod to operate upon these frames, that the rollers can both be adjusted together in a plane parallel to that of the saw, the parts being constructed, arranged, and operated substantially as described.

Second, the combination of pivoted arms *d d*, sliding cross-head *b'*, and adjustable screw *o*, with feed rollers which are supported in adjustable frames *a a*, substantially as described.

Third, the spring *f* and the frames *a' a'* of the pressure rollers *D D*, in combination with the adjusting screw *e'* and slide *e*, substantially as and for the purposes described.

Fourth, providing for the use of circular saws of different diameters by mounting the saw arbor upon a longitudinally adjustable frame *H*, constructed, arranged, and operating substantially as described.

Fifth, the adjustable saw arbor *G*, in combination with feed rollers *C D*, all arranged substantially as and for the purposes described.

Sixth, adjustable guide *F*, or its equivalent, in combination with the adjustable saw arbor *G*, substantially as described.

No. 46,426.—GEORGE K. SNOW, assignor to himself and MARCH BROTHERS, PIERCE & Co., Watertown, Mass.—*Neck-tie Supporters*.—February 14, 1865.—In this invention a wire is so bent as to have a saddle at its centre to rest on the button that holds the two ends of the collar in front; two arms then pass upward and laterally between the folds of the collar, and thence to the centre, where the ends terminate in eyes or hooks, to which the bow or scarf may be attached.

Claim.—The said bow or scarf supporter, as composed of the bow attachments *a a*, the button socket or saddle *b*, and the elastic arms *c c*, the whole being made of wire or its equivalent, substantially as specified.

No. 46,427.—JOHN S. LANDES, assignor to himself and HENRY G. HALBACH, Lancaster, Penn.—*Boot Crimping Machine*.—February 14, 1865.—This invention consists in the arrangement of the shin and instep pieces, held together by a leather hinge and connected to a base piece provided with two handled screws at the ends of the latter; the shin and instep piece being combined with sheet iron plates fastened on each side of the shin, and so attached as to be allowed to slide under the motion of the two former pieces.

Claim.—The construction and arrangement of the pieces *B C*, connected by a hinge *a b c* to the central projection *a* on the base piece *A*, with the two handled screws *F G* in *A*, acting on said pieces *B C* respectively.

Also, the pieces *B C* and their hinged attachment to *A*, in combination with their sheet iron plates *D E* and their attachments respectively, in manner shown, for operating upon the leather held by the clams *L' L'' L'''*, by means of the handled screws *F G*, all arranged and operating substantially in the manner set forth for the purpose specified.

No. 46,428.—CHARLES P. WIGGINS assignor to CASE, MARSH & Co., Indianapolis, Ind.—*Sawing Machines*.—February 14, 1865.—This invention consists in applying an adjustable slide to the guide-bar in such manner that the saw can be made to have a rocking motion as well as a reciprocating motion.

Claim.—The adjustable slide *E*, when connected to guide-bar *D*, and constructed to operate substantially as described.

No. 46,429.—JOAB K. WOOSTER, Strykersville, N. Y., assignor to himself and ROBERT DUNBAR, Buffalo, N. Y.—*Water Wheel*.—February 14, 1865.—The object of this invention is to economize the use of water for exerting force on a water wheel when the supply is limited, and to obtain a greater comparative force from a given minimum supply than that attainable from the maximum amount. Its novelty consists in the arrangement of buckets with partitions; and the combination and arrangement of the shaft *J*, the step *J'*, the solid shaft *F*, the hollow shaft *F'*, and a supporting step.

Claim.—First, a water wheel bucket having partitions *C* for the purposes and substantially as described.

Second, the combination and arrangement of the shaft *J*, including the step *J'* with the solid shaft *F* and a hollow shaft *F'* for the purpose of locating and supporting the step *J'* above the water, substantially as herein described.

No. 46,430.—JOAB K. WOOSTER, Strykersville, N. Y., assignor to himself and ROBERT DUNBAR, Buffalo, N. Y.—*Governor for Water Wheel Gates*.—February 14, 1865.—This invention relates to a means for opening and closing the gates of water wheels, and graduating with facility the quantity of water suited to the work being done, from the maximum to the minimum amount of water and capacity of the wheel. Its novelty consists in a belt, of varying width, applied to three pulleys on one shaft, the two outside being made fast on the shaft, and the middle pulley loose on the shaft; which shaft, by means of a rack and pinion connected with the water wheel gate and a governor of the ordinary construction, is made to control the movement of the gate.

Claim.—A belt of varying width running over three pulleys located in close proximity to each other on one shaft, the middle pulley being loose on the shaft, and the two outside being made fast on the shaft; and which shaft is, by means of rack and pinion, or other suitable device, connected with a water wheel gate and a governor of ordinary construction, so that the governor will control the movements of the gate, to admit a greater or less quantity of water upon the wheel, substantially as described.

No. 46,431.—JOHN VON BOHM, Melbourne, Australia.—*Process for Improving the Color of Molasses*.—February 14, 1865.—This invention consists in first diluting the molasses with water, after which a saturated infusion of nut gall is added until the color is changed to a dark brown; sulphuric acid is added to the mixture until it assumes a pale straw color, after which it is neutralized by means of carbonate of lime or other alkali, after which it is filtered and evaporated to the required density.

Claim.—The employment of tannin, substantially as herein described, in the purification of molasses.

No. 46,432.—WILLIAM HENRY BUCKLAND, London, England.—*Apparatus for Carbureting Air*.—February 14, 1865; patented in England, March 5, 1863.—This apparatus consists of a vessel divided into two compartments by a false bottom. The upper compartment is provided with vertical perforated partitions, which are covered with fibrous material. The fibrous material extends down through the apertures in the false bottom into the hydrocarbon liquid; the hydrocarbon liquid is supplied through the aperture into the upper compartment, and from thence it flows through the pipe into the compartment.

Claim.—The gas apparatus herein represented and described, consisting of the reservoir *a*, false bottom *b*, perforated partition *c c*, covered with fibrous material, inlet aperture *f*, and exit *g*, all constructed, arranged, and operating as specified.

No. 46,433.—PIERRE JOYOT, Jr., Paris, France.—*Looms for Weaving Double-faced Pile Fabrics*.—February 14, 1865.—The claim and engraving define this invention.

Claim.—In the manufacture of a double-faced fabric or tissue, presenting either a cut or non-cut pile velvet on part or on the entire of both surfaces of the fabric or tissue, the application, instead of the ordinary pile-wires of double-pronged forks, one prong or more of which serves for forming the upper, and the other prong for forming the lower pile, the said prongs or wires being either provided with a cutting edge or not, and the forks being moved automatically by the loom, substantially as set forth.

No. 46,434.—F. WATKINS, London Works, Birmingham, England.—*Machine for Heading Bolts*.—February 14, 1865.—In this machine the die for upsetting the end of the blank, and which forms the head of the bolt, is attached to the lower end of a vertically-sliding plunger which is operated by a cam upon a cross-shaft. The lower die is located in a horizontally-sliding frame, which, after the head has been formed, is drawn out from under the plunger, to enable the finished bolt to be removed and to insert a fresh blank. To facilitate the removal of the bolt a rod passes up into the die from below, its lower end resting upon a horizontal bar, pivoted at one end, the other free, and being connected by a stirrup to a cam upon the aforesaid cross-shaft. So soon as the die has been drawn out the bar is elevated by means of the stirrup and cam, and the bolt is thus pushed out of the die.

Claim.—First, the employment or use of a vertical slide or slides, carrying at their lower ends changeable dies, which are provided with cavities in their lower surfaces corresponding with the size and form of the heads required.

Second, the use of a movable carriage or carriages, containing changeable and adjustable heading tools, which are provided with holes or sockets corresponding with the body or shank of the bolt, arranged in combination with the hand levers, or other equivalent device, substantially in the manner herein specified, so that the operator working the machine may conveniently place the blank or remove the bolt, spike, or rivet, when completed.

Third, the arrangement of levers substantially such as herein shown and described, for the purpose of partly removing the articles from the heading tools after the same have been operated upon by the header.

Fourth, the application of India-rubber, or other suitable springs, substantially as described, for the purpose of furnishing a yielding bearing, necessary for the safe working of the machine.

Fifth, making the heading tools and dies of cast iron with chilled surfaces.

No. 46,435.—HUBLEY ALBRIGHT, Lewisburg, Penn.—*Horse-rakes*.—February 21, 1865.—This invention consists in an arrangement of devices for controlling the motions of the rake-teeth, discharging their load, &c. It will be understood from the claim and drawing.

Claim.—First, the arrangement of the teeth bars *H*, and bent rod *E*, the latter being attached to the axle *A*, as shown, and in such a relative position with the rake-teeth *I*, to operate as and for the purpose set forth.

Second, the lever *F*, in combination with the bars *H F L*, and the springs *O*, all arranged as and for the purpose specified.

No. 46,436.—WILLIAM AVENS and FREDERICK FRADLEY, Brooklyn, N. Y.—*Rotary Engines*.—February 21, 1865.—This invention consists of a wheel provided with two sets of chambers, to each of which access is had by two channels situated on the opposite ends of the chambers, and tapering off in opposite directions, in combination with a cylinder fitting closely to the circumference of the wheel, and with valves which open and close the steam ports in such a manner that, by admitting steam to the chambers of the wheel, a rotary mo-

tion may be imparted to the same in either direction, and, by a simple movement of the valves, the motion of the engine can be reversed at any moment.

Claim.—The wheel A, with one or more sets of chambers, B, which are provided each with two channels, d d' , situated at opposite corners, in combination with ports e e' , valves J, and cylinder F, all constructed and operating substantially as and for the purpose set forth.

No. 46,437.—SILAS BARKER, Hartford, Conn.—*Bomb Lance for Killing Whales.*—February 21, 1865.—The harpoon or lance is provided with a charged explosive head, fitted into it by a cylindrical stem containing a fuze, which, by means of a percussion device, is ignited after the harpoon strikes the whale, and the said charged head is detached and driven further forward before exploding.

Claim.—First, the arrangement of the mode of separation of the lance-head C, and fuze tube F, from the shaft of the lance, substantially as described.

Second, the arrangement of the adjustable hollow exploding lance head C, in the manner and for the purpose substantially as herein set forth and described.

No. 46,438.—CHARLES PETIT BENOIT, Detroit, Mich.—*Adjustable Tool-holder.*—February 21, 1865.—In this invention a bar inserted in the tool port has on its inner end another shorter bar, connected thereto by a knuckle-joint. This shorter bar has in its outer end a diagonal slot or mortise, extending from the bottom edge upwards and outwards, in which the cutting-tool is adjusted and secured by means of a set screw. By this arrangement, without turning the post, the cutter can be set at any angle relatively to the surface to be cut which may be desired.

Claim.—First the adjustable holder B, swivelled in the end of the stock A, so as to adapt the tool for various kinds of work, substantially as set forth.

Second, in combination with a tool-holder, constructed and mounted as above specified, the washer E, having grooved or roughened surfaces, and employed in connection with the nut C' for retaining the tool-holder in position, as explained.

No. 46,439.—GEORGE J. BENTLEY, Michigan City, Ind.—*Machine for Riving Hoops.*—February 21, 1865.—The bar of wood to be rived is sawed out of a proper width for the hoop required, and the end checked by a gang of circular saws. The end is then placed between the guiding friction wheels and advanced to the groove of the wheel, where it is seized by the bite of the upper pressure disk, and passing along is deflected upwards by another wheel emerging from between the latter wheel and the upper disk in a riven condition.

Claim.—The combination of the grooved wheel D with the disks F and F', the latter being suspended in hanging bearings, substantially as set forth.

No. 46,440.—EDWIN L. BERGSTRESSER, Berrysburg, Penn.—*Churns.*—February 21, 1865.—This invention consists in the arrangement of two crank wheels attached to two levers on top of the churn, the levers extending into the churn and having perforated beaters on each end.

Claim.—The double-acting dashers, with the steam reservoir and pipe, arranged and combined as herein described.

No. 46,441.—PAUL BIRCHMEYER, Syracuse, N. Y.—*Brushes for Cannon.*—February 21, 1865.—In this invention a hollow head as usual is made to fit the rammer or sponge staff, and a spiral groove is turned on its outside from one end to the other; a mat of horse or horned-cattle hair is then laid around the stock and lashed down by wire wound upon it, over the grooves, embedding it in the same.

Claim.—As an article of manufacture an artillery sponge, constructed as described—that is to say, by laying a mat of horse or horned-cattle hair around a central hollow stock or head, and fastening it by a wrapping wire into the spiral groove, the semi-globular end being made by looping in a portion of the mat, as described.

No. 46,442.—JOHN BLANCHARD, Pawtucket, R. I.—*Wet-feeding Device for Hair-cloth Looms.*—February 21, 1865; antedated February 16, 1865.—In this invention the feeder, which is designed to select, seize, carry across, and deliver into the shed of the warp a single hair at a time, dispenses with the usual appliances and nippers; and instead thereof, the feeder, which has the usual reciprocating motion across the loom, is a sheath enclosing a slender finger fitted to slide therein a short distance longitudinally, there being just sufficient space between the finger and the mouth of the sheath to admit a single hair. The finger has a number of barbs, like the teeth of a file, on its protruding end, and is slid in and out to seize and release a hair, by the action of the loom and a returning spring.

Claim.—The improved feeder for a hair-cloth loom described, constructed and operated substantially as herein specified.

No. 46,443.—GUISEPPE BOTTERO, Boston, Mass.—*Leather and Process of Manufacturing the same.*—February 21, 1865.—This invention consists in roasting sulphate of iron until it assumes a dark red color, after which it is thrown into water and allowed to remain

twenty-four hours; the liquid is then poured off from the sediment and used for tanning hides.

Claim.—The process above described, as well as the material or manufacture produced thereby.

No. 46,444.—PHILIP H. BRANSON, St. Louis, Mo.—*Street-lamp Posts.*—February 21, 1865.—This invention consists of a lamp post constructed in two parts, viz: a base which is set in the ground, and an upper portion which has a sleeve on its lower end which fits into the upper end of the base. By constructing lamp posts in this manner, when the upper part of the post is broken off it may be easily replaced.

Claim.—First, as a new manufacture, a lamp post constructed in two parts, substantially in the manner and for the purpose herein set forth.

Second, the employment of the chipping strips *C''*, substantially as and for the purpose set forth.

No. 46,445.—MYRON E. BROWN, Buffalo, N. Y.—*Variable Exhaust Nozzles.*—February 21, 1865.—This invention consists in dividing the conical or contracted portion of the exhaust pipe into halves, and in hinging them to the main exhaust pipe, the axis of which is at right angles to the axis of the nozzles in such a manner that, as they are caused to recede from each other by means of the general cam provided for that purpose, the area of opening is increased and the force of the blast is reduced, and upon the movement of the cam in the opposite direction they are caused to approach each other, and the area is reduced and the blast increased in force. One of these movable portions is provided with a flange which passes within recesses formed in the other, so that when extended the steam is prevented from escaping through spaces which would otherwise be formed between them. A flange or projection is placed upon the base of the movable parts, which rises to a sufficient height to prevent the escape of steam from their bases as they are opened.

Claim.—First, making a conical nozzle in two parts or halves, the said halves being hinged at the base, and so constructed that they lap past each other, so that when expanded by being moved upon their hinges the lapping parts will prevent any break or opening between the halves, substantially as described and for the purposes set forth.

Second, the flange *C'*, projecting inwardly inside the nozzle, for the purpose of breaking joints between the seat and base of the nozzle, and thus, by carrying the flange above the joint, prevent steam from escaping at the bottom of the nozzle, substantially as described.

No. 46,446.—CHURCH BURTON, Union, Me.—*Tanning.*—February 21, 1865.—This invention consists in using the green boughs of spruce and fir in preparing a tanning liquor.

Claim.—The tanning of hides and skins with evergreen boughs, such as spruce and fir.

No. 46,447.—EZRA CALDERWOOD, Portland, Me.—*Revolving Hay Rakes.*—February 21, 1865.—This invention consists of a revolving rake, to be drawn either manually or by a horse, and a means is employed for holding the rake in working position, which will admit of being readily actuated to liberate the rake, so that it may revolve and discharge its load when necessary.

Claim.—The combination with the thill *A'*, of the box *D*, movable cap *c'*, and spring bolt *G*, the latter engaging with the notched or recessed wheel *E*, upon the rake head, all as herein described.

No. 46,448.—ELIZUR E. CLARKE, New Haven, Conn.—*Machine for Cutting Pasteboard.*—February 21, 1865.—The object of this invention is to cut and score the board at one operation; to accomplish which, the machine is provided with two cutter bars bearing revolving adjustable cutters, and the board to be cut and scored is fed automatically.

Claim.—First, the method herein described of cutting pasteboard, by combining with fixed cutters and revolving cylinder a mechanism for raising and lowering the said cylinder to and from the cutters at given intervals of space, to more or less or not at all indent the pasteboard or to produce a through cut at pleasure, substantially as set forth.

Second, combining in one machine two cutter bars, provided with adjustable or fixed cutters, with two cylinders geared so as to revolve with equal velocities, one of the said cylinders revolving in fixed bearings, while the other, actuated by suitable mechanism, is raised to or lowered from the cutters, as herein described.

Third, in combination with adjustable or fixed collars and revolving cutter cylinder, a cam cylinder or wheel revolving in unison with the cutter cylinder, and actuating it to more or less impinge against the cutters at given intervals of space, substantially as set forth.

Fourth, the combination with the cutters, cutter cylinder and cam wheel, a feed bar, actuated by the cam wheel, or any part moving in unison therewith, in such manner as to feed the sheet to the cutters automatically and at proper intervals of time during the revolution of the cam wheel to receive the through and score cut between given points, substantially as set forth.

Fifth, the combination of the grooved and flanged disk, with detachable cams and clamps, and screw bolts to fasten the cams to the periphery of the wheels, substantially as set forth.

Sixth, in combination with a machine for cutting pasteboard, a sliding and adjustable platform, a table for receiving the scored and cut sheets, the arrangement being such that the said table may be slid under the main cylinder, so as to admit of the operator approaching the cutters to adjust them, substantially as set forth.

Seventh, the combination of the cutter-holder and stock, fitted together by means of a vertical tongue and groove, with one or more horizontal guide tongues on the back of the stock, and fitting and sliding in a corresponding groove or grooves in the cutter bar, or the projecting studs or the cutter stock lapping over and under the cutter bar, together with a binding bolt passing through the central guide tongue, substantially as set forth.

Eighth, the forked arm and groove screw nut, working in combination with the inverted T-groove in the side of the cutter bars, with the binding screw bolts and nuts, substantially as described, and for the purpose specified.

No. 46,449.—ALFRED P. CORVELL, Janesville, Wis.—*Medical Compound*.—February 21, 1865; antedated February 16, 1865.—This invention consists of a mixture of nitric acid, citric acid, sweet spirits of nitre, spirits of turpentine bi-tartrate of potassium diluted with distilled water.

Claim.—The use of a compound made of the ingredients above specified, mixed together in about the proportion and substantially in the manner set forth.

No. 46,450.—JAMES A. COWLES, Chicago, Ill.—*Horse Hay Forks*.—February 21, 1865.—This invention consists in the construction and combination of several parts identified by the claim, from which and the engraving it will be readily understood.

Claim.—First, the combination of the key or right-angled lever *f* with the bail pivoted at the eyes *p p*, when said bail is located in the described situation with the handle *c*, and head *a a*, as and for the purpose herein set forth.

Second, the combination of the head *a*, handle *c*, key or right-angled lever *f*, catch *o o*, and bail, in the manner and for the purpose described.

No. 46,451.—ELLIOT H. CRANE, Jonesville, Mich.—*Door Fastener*.—February 21, 1865.—In this invention, flat spurs are formed transversely on one end of a metallic plate, and at right angles thereto, while at the other, in a longitudinal slot extending to the middle of said plate, is hinged a segmental latch; this latch, by means of a spring, is projected through the slot to the side of the plate opposite the spurs, and when the latter are inserted in the jamb in their proper position, the door by closing impinges on said latch, and forces it to the opposite side until the door passes, when the spring again forces it to its normal position, and the door is secured against opening from the outside.

Claim.—The combination of the segmental latch piece *B*, vibrating on a pivot within a slot of the plate *A*, and actuated by the spring *C*, by which the plate being fastened in position, the closing door forcing back the latch piece, which is forced to return when the edge of the door has passed it.

No. 46,452.—EPHRAIM CULVER, Shelburne, Mass.—*Clothes Dryer*.—February 21, 1865.—In a hub on an upright shaft are pivoted four or more arms so as to move in vertical planes. In each arm is a longitudinal slot. Through each slot just passes one end of a brace, the other end of which is pivoted to the hub above the point at which the arms are pivoted. By means of a set screw the end of each brace may be adjusted at any part of the slot in its corresponding arm, and thus the arm may be raised or lowered at will.

Claim.—The combination of the slotted and movable arm *c*, the movable brace *d*, and hub *i*, and the screw and nut *e*, substantially as and for the purpose described.

No. 46,453.—EBENEZER F. DECKER, Southport, Maine.—*Fishing-line Sinkers*.—February 21, 1865.—In this invention the sinker is suspended between portions of the line, with ring and swivel connections; two rigid arms, connected together, being firmly imbedded in the middle of the sinker.

Claim.—The combination of the guard ring, the line, the swivel, the sinker, and the arms *D B*, the whole being arranged substantially as specified.

No. 46,454.—JOHN DEERE, Moline, Ill.—*Ploughs*.—February 21, 1865.—This invention relates to devices for giving strength and stability to the parts, consisting of lugs and ears upon the land side, in combination with other parts, by means of which the plough can be more readily put together, and, when once put together, remains firm and substantial.

Claim.—First, the combination of the land side *A* with the solid lugs 3 3 3 and the perforated ear 5, substantially as and for the purpose set forth.

Second, the lug 3, cast on the land side, substantially as and for the purpose set forth.

Third, the guide and fastening ear 5, in combination with the movable standard, substantially as and for the purpose set forth.

Fourth, the combination of the land side standard and mouldboard, by means and in the manner substantially as described.

Fifth, the construction of the shear *C*, with the perforated ear *g*, substantially as and for the purpose set forth.

No. 46,455.—PORTER DODGE, Perkinsville, Vt.—*Soapstone Stove*.—February 21, 1865.—This invention consists of an iron frame, into which soapstone plates are fitted; plates of soapstone are also arranged in iron frames inside of the fire-chamber, so as to prevent too great radiation of heat on the external plates. Ornamental perforated metallic plates, fitted at edges into the frame, cover the sides and ends of the stove. Between the two plates of stone on top—one immediately over the fire-chamber and the other fitted to the rim on top of the perforated plates—is an air space; there is a door of soapstone for the fire-chamber and a corresponding one in the covering.

Claim.—First, constructing and arranging the corner pieces C of the iron skeleton frame of a stove, so that they hold the soapstone slabs and the outer open iron work, substantially in the manner described.

Second, in combination with the corner pieces C, secured to the bottom of the stove, the top piece D, for the purpose of holding both the corner pieces and the top slab E of the stove, substantially in the manner described.

Third, the combination and arrangement of the inner linings L with the outer slabs B, when constructed and applied substantially as and for the purpose described.

Fourth, the combination and arrangement of the iron skeleton frame with the soapstone sides B and top E, inner linings L, outer iron work F, and stovepipe attachment, substantially as and for the purposes set forth.

No. 46,456.—ARAD DUNCAN and JOHN M. ZIEGLER, Aurora, Ill.—*Car-seat Lock*.—February 21, 1865.—This invention consists of a cylindrical case, which is to be let into the wood, having arranged within it a round bolt bevelled at its outer end; a spiral spring for projecting the bolt outward, and a cam or circular inclined plane, upon or against the surface of which a pin protruding from the bolt is made to slide and thus retract the bolt as the latter is turned around by the key.

Claim.—The combination of the bolt E, pin *d*, cam D, spring *a*, and barrel A, when constructed and arranged as herein specified, so that when in its operative position the said bolt will project from its case, but be free to spring within the same in closing, and when reversed will be held within its case by the action of the cam and pin.

No. 46,457.—JOHN R. ELLIS, company F, 22d regiment Wisconsin volunteers.—*Rotary Engines*.—February 21, 1865.—The novelty of this invention consists in two revolving piston wheels connected together by cog wheels, and placed eccentrically in two adjoining cylinders, in combination with a valve which occupies the channel leading from one cylinder to the other, and to which motion is imparted by eccentrics or other means mounted on the shaft of the piston wheels in such a manner that said piston wheels and intervening valve are alternately acted upon by the steam passing in through the channel connecting the two cylinders, and that, by the action of the valve and piston wheels, one cylinder takes steam while the other exhausts, and *vice versa*.

Claim.—The revolving piston wheels D D', which are placed eccentrically on shafts C C' and geared together by eccentric wheels F F', to operate in combination with the adjoining cylinders B B' and intervening valve E, substantially in the manner and for the purpose herein shown and described.

No. 46,458.—MOSES R. FLANDERS, Ilion, N. Y.—*Scythe Fastening*.—February 21, 1865.—A band surrounds the end of the snath, flattened at one side; this band is provided with a transverse flange at its lower end, so that the ring which is put on over the band from the upper side may not slip off it. The heel of the scythe passes between the band and the ring, and is secured by the latter.

Claim.—The scythe fastening, consisting of the heel guard A, heel band B, heel plate E, and heel ring C, when constructed and combined substantially as set forth.

No. 46,459.—VALENTINE FOGERTY, Boston, Mass.—*Magazine Fire-arms*.—February 21, 1865.—This invention relates to the magazine of repeating or self-loading fire-arms, and consists of a tube, with transverse recesses or rack grooves, separated by the length of the cartridges, which are thus supported therein by flanges. A concave rack-bar, similarly grooved, has a longitudinal play within said tube and between it and the series of cartridges sufficient to draw the cartridges forward one length at each reciprocating movement of the said concave rack-bar, and thus the cartridges are successively presented within the chamber of the arm.

Claim.—First, the reciprocating grooved rack D, suspended by ears *d* from a bar *b* and actuated by a rod C, the said rack operating in combination with the grooved magazine A *g*, to forward the cartridges *a a*, as herein described.

Second, in combination with the above, the elongated hoies *b* in the ears *d* to permit the vertical or lateral motion of the rack, as and for the object specified.

No. 46,460.—JOSEPH FREY, Battle Creek, Mich.—*Saving Machine*.—February 21, 1865.—The object of this invention is to saw logs of wood into bolts by a drag saw, and it consists in an arrangement of devices by means of which the saw is operated to saw off a cut, when it is raised up out of the way and the log fed along the distance of another length of bolt.

Claim.—The arrangement in a sawing machine of the saw L, guide L', saw frame L2, spring G, levers E L4 J1, pitman h, crank wheel H, worm A, rod f, pinion B, tumbling shafts C C', and roller D, the whole constructed and operating substantially as herein set forth.

No. 46,461.—ELI P. GARDINER, New York, N. Y.—*Machinery for Breaking Quartz, &c.*—February 21, 1865.—This invention consists in the peculiar arrangement and construction of the parts, and will be readily understood by the claim, in connection with illustration.

Claim.—First, the combination and arrangement of the arms D D', hung upon centres at unequal distances from the faces, with the operating shaft G and cranks and shackle bars H H, the whole operating together in the manner and for the purposes described.

Second, the combining and arranging and operating the sieves and trough with the reciprocating arms, in the manner and for the purposes specified.

No. 46,462.—PERRY G. GARDINER, New York, N. Y.—*Quartz Crusher.*—February 21, 1865.—This invention consists in an oscillating basin, the lower end of whose shaft is connected with and rotates in the hub of the machine. Upon the axle or shaft is adjusted the ring or bush, which is fitted with slots to receive and hold firmly the iron bands or straps; the object of these bands or straps is to support and strengthen the basin; within the basin is placed the ball which is to pulverize the ore.

Claim.—First, the combination and arrangement of the vibrating bush blocks G and H and the pillar blocks D, operating in the manner and for the purposes described.

Second, the combination of the bush blocks, double-joint and pillar blocks, with the hollow shaft and basin, acting in the manner and for the purposes described.

Third, the manner of strengthening and supporting the sides of the basin by means of the bands or straps N, having their bearings in the ring or bush block M, whereby support is given to the basin, so that it can be constructed with less weight of metal than would otherwise be required.

Fourth, the combination of the vertical shaft I, the forked arm K, and the inclined shaft or axle L with the basin, whereby the progressive oscillatory, but not rotating, motion is given to the basin by the rotation of the vertical shaft I, as described.

Fifth, the combining and arranging of a rake P with the inclined shaft L and the basin F, so as always to be in front of the ball and to oscillate with the basin and shaft, for the purposes and in the manner described.

No. 46,463.—ANDREW J. GOVE, San Francisco, Cal.—*Dredging Machine for Harbors and Rivers.*—February 21, 1865.—This invention consists of a scow, furnished with a scoop, so arranged as to be used as a dredge, and also as a vehicle for conveying material to a proper place for dumping.

Claim.—The scoop or dredger D, in combination with the scow C, or other convenient vessel, the spars or braces S S', the various lanyards and guys, and the compensating weights W W, substantially as described, and for the uses and purposes as herein before set forth.

No. 46,464.—WM. H. GRANT, Winchendon, Mass.—*Method of Uniting Rubber Rolls to Shafts.*—February 21, 1865.—This invention consists in melting the rubber in the interior of the roll by drawing it over a heated instrument which surrounds that portion of the shaft on which the roll is to be laid, which instrument, on being withdrawn, leaves the roll in the required position.

Claim.—The method of uniting rubber rolls to shafts substantially as set forth.

No. 46,465.—PHILIP R. GROSS, Manheim Centre, N. Y.—*Car Coupling.*—February 21, 1865.—The object of this invention is to obtain a coupling of the class called "automatic," which will operate with certainty as regards the coupling or connecting of the two draw-heads, and which will admit of being readily uncoupled when required, and also not coupling when necessary, as in case of backing cars when it is not desired to connect them.

Claim.—The frames C, fitted on pivots at the front of the draw-bars A, and provided each with a hook E attached to an arbor c, and also provided with a vertical rod d in connection with the pawls H attached to the pivoted frames I, all arranged in connection with springs, to operate in the manner substantially as and for the purpose herein set forth.

No. 46,466.—STUART GWYNN, New York, N. Y.—*Impregnating Fibrous and Porous Material.*—February 21, 1865.—Fibrous and porous substances are impregnated with a heated composition of paraffine and rubber, gutta percha, or other gum, combined in proper proportions, for the purpose of rendering them water-proof, and not liable to injury from the moisture, dryness, heat or cold of the atmosphere, without at the same time rendering them impervious to air.

Claim.—Impregnating cloth, paper, or other fibrous or porous substances with the composition above described, for the purposes set forth.

No. 46,467.—JAMES HARPER, Hillsborough, Iowa.—*Beehive*.—February 21, 1865.—The comb-bearer is constructed of twelve frames, each of which is in the form of an isosceles triangle, or nearly so. These frames are set close together at their tops, while they are blocked apart to the distance of half an inch at their bottoms. The comb-bearer is closed at its ends with glass and at the bottom by a perforated hinged board.

Claim.—The arrangement of the comb-bearers A, stand S, lighting board B, and house E F, when constructed substantially as described and for the purposes set forth.

No. 46,468.—HORACE HARRIS, Newark, N. J.—*Harness Snap*.—February 21, 1865; antedated February 12, 1865.—A hook, the point of which is bent round toward its stock as a sickle toward its handle; has a projection similar to and about opposite its point. A spring, fastened at one end to the stock, presses against both the point and the projection so as to completely close the interval.

Claim.—The extension of the spring A, in combination with the knob C and the hook B, for the purposes herein set forth.

No. 46,469.—J. O. HARRIS, Ottawa, Illinois.—*Railroad Ticket-holder*.—February 21, 1865.—In this invention a plate is fastened to any part of the passenger's dress, and two hooks, one at the bottom and another in one side of the plate, are made to hold the ticket.

Claim.—The combination of the herein described plate, the socket or clasp *b b*, and the spring or clasp *b' b'*, arranged and operating substantially as and for the purposes herein shown and set forth.

No. 46,470.—WM. CLEVELAND HICKS, New York, N. Y.—*Steam Engine*.—February 21, 1865.—This invention consists in the combination and arrangement of the following devices: Four cylinders are placed in opposite pairs in one and the same plane, and cast together, with a disk containing channels or steam-ways, through which it is admitted to and discharged from the cylinders. Through the outer ends of each cylinder pistons are introduced, which are of peculiar construction, in consequence of which they perform the functions of pistons and valves, and open and close the channels which admit the steam to the next in the series to the one in which the piston is located. From the inner ends of these pistons a connecting rod extends to a common crank, located centrally between the cylinders, which transmits the power to the machinery to be driven. The pistons are single-acting, and only receive the steam upon their outer ends.

Claim.—The combination and arrangement of steam machinery, operating substantially in the manner herein set forth.

No. 46,471.—JAMES IVES, Mount Carmel, Conn.—*Lamp*.—February 21, 1865.—This invention consists in attaching the ends of two chains to devices supporting the deflector, chimney, and globe, and the other ends to the oil reservoir, so that, by suspending the lamp by passing said chains over pulleys, the reservoir, by the same act, may sink and the other parts rise, so as to expose the flame, trim the lamp, &c.

Claim.—First, a combined globe and chimney base or seat, substantially as and for the purpose set forth.

Second, in suspending the lamp and a globe and chimney that the movements of the lamp downward will cause an upward movement of both the chimney and the globe, substantially as and for the purposes set forth.

Third, the rods *G G'* passing through the base *D* substantially as described.

Fourth, the combination of the rods *G G'* and *I I'* with the stay guard plate *H*, base *D*, lamp *A*, and chains *J J'*, substantially in and for the purpose set forth.

No. 46,472.—HENRY F. JENKS, Providence, R. I.—*Window Sash Supporter*.—February 21, 1865.—A rectangular frame is let into the stile of the sash. Behind this frame a mortise is cut in the sash, in which is a spring which presses continually against the window frame, and thus holds the sash wherever it may be placed. The spring is arranged to act with greater or less force against the frame, according as the sash is heavy or light. The spring is withdrawn from contact with the window frame, when it is desired to raise or lower the sash, by means of a finger piece pivoted to the aforesaid frame in the sash.

Claim.—The arrangement of the spring *D*, the frame *C*, and the hooked finger piece *E*, constructed and operating substantially as described.

No. 46,473.—JAMES JENNINGS, New York, N. Y.—*Apparatus for the Manufacture of Illuminating Gas*.—February 21, 1865.—This apparatus consists of two retorts for superheating steam; also, of three retorts to contain carbon, which latter are connected with steam retorts by means of pipes, and a pipe connecting the carbon retorts with a decomposing retort. In operation, steam enters the first named retorts, which are filled with pieces of porcelain, brick, &c., and also with scrap iron, when it is heated to incandescence and decomposed. The resulting gases then pass into the carbon retorts, when they are charged with carbon, and finally treated in the decomposing retort.

Claim.—The bench, constructed substantially as described for the purpose specified.

No. 46,474.—DANIEL KAUFMAN, Boiling Springs, Penn.—*Combined Threshing Machine and Straw Cutter*.—February 21, 1865.—In this invention the cylinder and concave are both armed with beaters that have one cutting edge. When used as a thresher the back or blunt edges perform the work. By reversing the cylinder and concave the cutting edges act in concert to cut straw or hay for feed, &c.

Claim.—The combination of the toothed cylinder C and toothed concave D, arranged so as to be capable of being reversed in position, and provided with teeth bevelled or sharpened at one side, and broad and blunt at the opposite side, to form a combined fodder cutter and threshing machine, substantially as set forth.

No. 46,475.—ORIN KENISON and ANDREW J. MCCLARY, Lawrence, Mass.—*Friction Mechanism for the Warp Beam of Looms*.—February 21, 1865.—In this invention the lever is prevented from vibrating as usual, and the irregularities of friction of the strap resulting from such vibration, and the consequent improper delivery of the warp, are avoided.

Claim.—The combination of the stationary bracket M, the screw N, and hook O, or their mechanical equivalent or equivalents, with the lever I and the friction strap F, when the latter are applied to the loom frame and the warp beam, substantially as specified.

No. 46,476.—ALEXANDER G. KNAPP, New York, N. Y.—*Apparatus for Stirring and Cooling Lard*.—February 21, 1865.—This apparatus consists of a tank for containing the lard, together with stirrers made of coiled metal tube. These stirrers are made hollow for the purpose of having a stream of water from a tank flow through them so as to cool the lard while it is stirred. The stirrers are vibrated by means of any suitable device.

Claim.—The employment or use, for the purpose of stirring and cooling lard, of the serpentine or spiral dashers C C and D, constructed substantially in the manner herein shown and described.

No. 46,477.—BENJAMIN I. LANE, South Framingham, Mass.—*Apparatus for Inhaling Pure Air*.—February 21, 1865.—This invention consists in an elastic air-tight reservoir worn upon the person, and which, by means of a bellows-like motion that can be given the reservoir by the two handles, one before and the other behind, can be filled with air under pressure. Attached to this reservoir, by means of a pipe and valve, is a mask fitting tightly over the face, so that when the wearer enters an unrespirable atmosphere he can obtain air from the reservoir.

Claim.—First, the construction of the reservoir A with a valve *a* and hand straps *b*, substantially in the manner and for the purpose described.

Second, the combination of adjustable elastic straps with the air reservoir A, valve *a*, substantially in the manner and for the purpose described, whether the straps be the means of attachment to the body or other means for this purpose be employed.

Third, the combination of the mask C, furnished with the three contrivances B *g h*, or their equivalents, with the cock *p* and reservoir A furnished with the valve *a*, all substantially in the manner and for the purpose described.

Fourth, the device *h*, for allowing the wearer of the apparatus to inhale fresh external air when it is safe to do so, in combination with an air reservoir, which has its air under control of a cock *p*, substantially as and for the purposes set forth.

Fifth, the use of one or more elastic straps *c c*, applied to the flexible reservoir A, for attaching the latter to the body, and also for keeping up the supply of air to the respiratory organs, substantially as described.

No. 46,478.—ISAAC S. LAUBACK, New York, N. Y.—*Metal Drilling Machine*.—February 21, 1865.—In the arm of the machine is a joint, by means of which the drill spindle can be set at any angle with the supporting column. The driving head is connected with the spindle head by means of an adjustable rod fitted with one or more universal joints in such manner that the drills can be moved about the driving head from place to place and put in a great variety of positions without materially interfering with the application of power thereto.

Claim.—Combining and uniting the two adjustable brackets Q and W by means of the adjustable connecting rod T, fitted with one or more universal joints, the one of said brackets to be combined with the driving head and the other with the spindle head of the machine, substantially in the manner described for the purposes specified.

No. 46,479.—JOHN PHILIP LEBZETTER, Lancaster, Penn.—*Wood Bending Machine*.—February 21, 1865.—This invention consists of a drum of a semicircular form properly secured to a frame. On the top and bottom of this drum, and on each side of the same, at a point about two-thirds of the distance back from the front, there is bolted a plate, near the end of which is a hole to receive a pivot that is attached to the top and bottom of two frames or winged levers, one of these levers being on each side of the drum, and attached to these winged levers is a vertical shaft, with an adjustable eccentric lever, that revolves and slides longitudinally on said shaft. Bolted centrally to the two front upright posts are two wooden springs projecting on each side of the drum; on the ends of these springs is a head with a tapered notch cut in the same to receive and hold fast the winged levers. To the front of the drum, and on each side of the same, is a rod fastened to the top and bottom of the same, passing perpendicularly through the centre partition of the drum.

Claim.—The winged levers E E, held by pivots or hinges on the drum, in combination with the spring or springs H, or their equivalent, for retaining them.

Also, the eccentric lever L, on its vertical shaft F, for shifting it up and down, in combination with the slotted hook k, wedge P, and rod or shaft R, arranged and operating substantially in the manner and for the purpose specified.

No. 46,480.—JAMES P. LONG, Osage, Iowa.—*Combined Seeder, Cultivator, and Roller.*—February 21, 1865.—The novelty of this invention consists in a combination of old devices in a peculiar manner so as to form a practically working combined machine.

Claim.—The combination of the seed cylinder E, adjustable frame F, tubes L, and distributors L', cultivator teeth M, and roller B, the several parts being arranged and operating as and for the purpose specified.

No. 46,481.—W. C. MCGILL, Cincinnati, Ohio.—*Sash Fastener.*—February 21, 1865.—This invention consists of two levers let into the stile of the sash, hung to the same pivot, at right angles to each other, the long arms of one extending upwards and outwards against the frame at an angle of about 45 degrees, the other downwards at the same angle; their ends being chisel-shaped, and operating as cams against the frame, being held, the upper one by its own weight, the other by a weight attached to its shorter end. The movements of both are moreover controlled by a crank, the handle of which projects inside the stile of the sash.

Claim.—The arrangement of the pair of gravitating latches E e' and F f, and of the operating crank H G, the whole being formed, combined, and operating substantially as set forth.

No. 46,482.—RICHARD MONTGOMERY, New York, N. Y.—*Railroad.*—February 21, 1865.—The object of this invention is to furnish an aerial railroad particularly adapted to the streets of cities, but applicable also wherever else such a structure would be found advantageous. It consists in the construction of such railroad of corrugated beam iron, its several parts properly secured together; also in the use of a condensing or dummy engine attached to each car for propulsion, the wheels of the car being peculiarly adapted to the form of the rail.

Claim.—First, the use of corrugated iron beams in the construction of aerial railroads, substantially as set forth.

Second, the use of flat beams or bars of iron for connecting the ends of the rails together, and also for connecting and fastening the columns of support to the cross-ties, in the manner and for the purpose set forth.

Third, the use of corrugated iron rails, in combination with corrugated iron cross-ties and corrugated iron columns of support, in the construction of aerial railroads.

No. 46,483.—JAMES MORRISON, JR., Troy, N. Y.—*Coal Stove.*—February 21, 1865.—The fire grate is so constructed as to admit the removal of ashes, &c., without dumping, so that the fire is not prevented from burning freely during the operation. A cast-iron or fire-brick ring, with an air chamber perforated with numerous small apertures, is located so as to admit fresh air to the fire at a point about half way between the burning surface of the coal and the top of the fire grate.

Claim.—First, the employment of a vertical grate and frame I, with the downward recess E and horizontal grate o therein, in combination with the dumping and vibrating grate F, in the manner and for the purposes substantially as herein set forth.

Second, the combination with the stove a grate so constructed and arranged that the clinkers or like draught-obstructing material may be removed from any point or place at or just above its surface without dumping said grate, in the manner substantially as herein described and set forth.

Third, the special arrangement and combination of the iron ring G' containing the air chamber G, and communicating with the fire at the sides of the fire chamber by means of numerous small apertures, with the tiers of fire-brick K and K' surrounding the fire chamber above and below the said iron ring, in the manner substantially as herein set forth.

No. 46,484.—A. W. MOORE, Stafford, Conn.—*Jack for Pegging Boots, &c.*—February 21, 1865; antedated February 12, 1865.—This invention consists in the employment of one or more cams, in combination with a holder secured by means of an oscillating collar and a socket piece, which is secured and turns upon a post or standard.

Claim.—The employment of one or more cams F, in combination with the holder B and the socket plate A, arranged and operating substantially as and for the purpose described.

No. 46,485.—GEORGE M. MOWBRAY, Titusville, Penn.—*Ejector for Oil Wells.*—February 21, 1865.—This invention relates to the arrangement and combination of parts, which consist of a pipe through which air is forced down into a well, and a surface at the bottom of such pipe to resist the air and give it an upward motion, together with a plurality of pipes and passages, for the purpose of dividing, distributing, and conducting the air upward, so that it shall act upon the substance to be raised in finely comminuted currents.

Claim.—First, in ejectors for elevating liquids and other substances from wells, the com-

bination and arrangement of the following specified parts: first, a pipe through which to force air down into a well; second, a surface at the bottom of such pipe to resist the air so forced down, and give it an upward motion: and thirdly, the combination and arrangement of the plurality of pipes and passages, whereby to divide and distribute and conduct the air upwards, so that it shall act upon the oil or other liquids, and obstructing substances in its ascent, substantially as described.

Second, the combination and arrangement of the above-mentioned three parts, with an enclosing pipe into which they are to be placed, and between the inner surface of which and the outer surface of the pipe through which air is to be forced down, the liquid to be elevated is to ascend.

Third, a bulb or inverted cup or nozzle B, of any suitable form, screwed or otherwise attached to or formed upon the blast pipe, and provided on its upper surface with a plurality of apertures to deliver the air in attenuated form, substantially as set forth.

Fourth, in combination with the aforesaid pipe closed at bottom, and bulb B, with a plurality of apertures, the cup C, adjustable in the relation to the said bulb, substantially as and for the purposes set forth.

Fifth, in combination with the blast pipe A, the cup or bulb B, having upon its upper surface a plurality of perforations, slits, or tubes, surrounding the said blast pipes, substantially as and for the purposes set forth herein.

No. 46,486.—W. NEEDHAM and J. NELSON, Rockford, Ill.—*Harvester*.—February 21, 1865.—This invention relates to the manner of constructing and arranging the parts of the main frame when tubular iron is employed in the construction thereof: to the employment of clamps used in holding the parts of said tubular frame together, and of the gear frame combined therewith; also, to the devices employed for adjusting the seat, holding the reins, &c.

Claim.—First, the construction and arrangement of a tubular frame, substantially as and for the purpose set forth.

Second, the sockets or clamps as shown in Figs. 4, 5, 6, and 9, in combination with the tubular frame, for the purposes specified.

Third, the gear frame K', with the clamp K, when constructed and combined with the tubular frame, as described.

Fourth, the wedge washer k, with serrated or notched faces, in combination with the notched face l' of the standard, and the notched face j in the clamp piece b', as and for the purpose set forth.

Fifth, the wedge washer r, in combination with the spring seat R and the standard R', in the manner and for the purpose set forth.

Sixth, the clamp levers H' H' and clamps h'' h'', in combination with the stirrup h, for the purpose specified.

Seventh, the levers M, spring catch g, rack N, pulleys m n, in combination with the rope or chain l and adjustable standard P, for the purpose set forth.

Eighth, in combination with the guard bar E, provided with the wood centre piece F attaching the guards, as and for the purpose set forth.

Ninth, the combination of the adjustable dividing runner J, the socket F', and sleeve I, when constructed and operating conjointly, as and for the purpose set forth.

No. 46,487.—JOHN NEIL, Clinton, Mass.—*Shirt Bosom*.—February 21, 1865.—This invention consists of the bosom material being woven in patterns, with the ornamental band adjusted to fall in the centre, and a facing part of a peculiar color or shade parallel thereto, the latter to be divided and turned under.

Claim.—As a new article of manufacture, the woollen shirt bosom herein before described, woven in single pattern, cut in the centre, and jointed at the edges, all as specified.

No. 46,488.—FREDERICK NISHWITZ, Brooklyn, N. Y.—*Harvester*.—February 21, 1865.—This invention relates to the mechanism for operating the cutters; to the means for raising the cutting apparatus; to the attachment of said cutting apparatus to the main frame; and to the arrangement of a supplementary in a shoe for sustaining a portion of the weight of said cutting apparatus and protecting the connecting rod.

Claim.—First, the combination of the stationary toothed plate D, pinions F F attached to the ends of an arm E firmly keyed on the axle C, with the pinion G on the collar H placed loosely on the axle, and the lever wheel I also placed loosely on the axle and connected with the collar H, all arranged to operate substantially as and for the purpose set forth.

Second, the lever M' applied to the main frame A, and in relation with the draught pole N*, as shown, and connected to the finger bar O by a chain f, all arranged to operate substantially as and for the purpose set forth.

Third, connecting the finger bar O with the main frame A by means of a joint composed of the semicircular recesses g g in the pendants P P and the semicircular projections h h on the sides of the finger bar O, substantially as described.

Fourth, the shoe S, arranged and applied to the main frame A relatively with the pitman N and finger bar O, to operate substantially as and for the purpose specified.

No. 46,489.—OLIVER B. NORTH, New Haven, Conn.—*Harness Saddle-tree*.—February 21, 1865.—This invention consists in forming jockeys in connection with that part of the bow to which the crupper loop is attached all in one piece; also, in the casing of a stud upon the under side of the upper portion of the seat, and in uniting the check hook to the bow of the jockeys, by inserting the shank of the hook between the bow of the jockeys and the lower frame, and using a screw and pin to firmly secure it.

Claim.—First, a metallic saddle-tree for harness, composed of the jockeys, cantel, and seat, cast in separate pieces, and united together, substantially in the manner and for the purpose described.

Second, casting a stud upon the under side of the seat, for the purpose of uniting said seat to the cantel without passing rivets or screws through, which interfere with and mar the plating or japanning, as herein described.

Third, uniting the check hook to the tree by passing the shank of the hook under the bow of the jockeys and above the frame, and uniting it by the stud or pin *f* and the screw and nut *g b*, or their equivalent devices, substantially as herein described and represented.

No. 46,490.—THOMAS G. ORWIG, New York, N. Y.—*Projectile*.—February 21, 1865.—The projectile screws into a cylindrical ring cup, which has an extension rearward, and to which is secured the cartridge bag. The charge is introduced through holes in the base of the cup; and to the base is secured a central spindle, on which are fitted several telescopic tubes, the outer one of which has radial wings. When the charge is fired the tubes extend rearward and form a guiding tail.

Claim.—First, the telescopic tubes *g g*, adapted to slide and rotate one within another, in the described combination with the ball *A*, stem *f*, and wings *h h*, all arranged and operating in the manner and for the purposes set forth.

Second, the combination of the perforated cap *B* with the winged telescope stem *E*, soft metal ring *C*, projectile *A*, and cartridge bag *D*, constructed and operating substantially as and for the purpose described.

No. 46,491.—SAMUEL PATRICK, Galesburg, Ill.—*Heating Carving Table*.—February 21, 1865.—In this invention a carving table is provided with a series of pans of varying depths, communicating with each other and with a boiler, whence, by means of pipes, a supply of hot water is afforded. Vessels for holding food fit into these pans. The device is designed for use in hotels, &c.

Claim.—First, a carving table which is provided with a series of pans of varying depths, that communicate with each other and also with a boiler, substantially as described.

Second, distributing water of different temperatures through a series of pans by producing a circulation, substantially as herein described.

No. 46,492.—C. C. PECK, Black Hawk, Colorado Territory.—*Amalgamator*.—February 21, 1865.—This invention consists of a series of pans, arranged upon a swinging platform in such a position that each pan empties into the one next below it in the series, and then giving to the platform both a vertical and longitudinal movement, by means of a cam and crank, which are attached at one side to the frame, and gives a three-fold movement, viz., a longitudinal, a vertical, a partially rotary motion, all operating conjointly and simultaneously.

Claim.—First, the pan *B*, constructed in the form and style shown and described.

Second, a series of pans, arranged to operate in the manner and for the purpose set forth.

Third, the spider *m*, provided with the bearing *n* and arm *h*, substantially as shown and described.

Fourth, the suspended platform *A*, arranged to vibrate vertically and longitudinally, as and for the purpose set forth.

Fifth, so arranging an amalgamator pan as to give to it the three-fold motion, substantially as and for the purpose set forth.

No. 46,493.—THOMAS W. PIERCE, Richfield, Minn.—*Stock Feeder*.—February 21, 1865.—Through a chest containing feed runs, longitudinally, a shaft, with a series of cavities upon its surface, which become charged with feed and deposit it, as the shaft rotates, in a trough below.

Claim.—First, the shaft *F*, mounted within the chest *A*, in the manner described, and provided with cups which, by the rotation of the shaft, are filled and discharged, substantially as and for the purpose set forth.

Second, the spring *L* and knob *M*, in combination with the notch or recess *N*, for holding the shaft *F* against rotation when the feeding operation is suspended.

No. 46,494.—MARY PIKE, Cornish, N. H.—*Eye Water*.—February 21, 1865.—This invention consists in a composition of sulphate of zinc and chloride of sodium dissolved in water, to which winter green or other essence may be added.

Claim.—An eye water or lotion, composed of the sulphate of zinc and chloride of sodium mixed together and dissolved in water, about in the proportion herein set forth.

No. 46,495.—WM. L. POTTER, Clifton Park, N. Y.—*Roofing Composition*.—February 21, 1865.—This invention consists of a composition of ground slate rock, coal tar, and oil paint.

Claim.—The use of pulverized slate rock for roofing, covering the sides of buildings, boat decks, &c., as set forth and described.

No. 46,496.—W. B. PURDY, Huntingdon, Penn.—*Universal Timepiece*.—February 21, 1865.—In this invention a number of concentric circles are marked upon the dial of a watch, each of which is marked with the name of a place. The several hands correspond to the number of circles, and are constructed of different lengths. The hands move upon a common centre, but are capable of an adjustment, so that the distances between each of them may be made to correspond to the difference in time of the places marked on their respective circles.

Claim.—The application of two or more sets of hands $a^* a'^* b^* b'^*$, and so forth, secured to a common centre g , and operating in combination with two or more concentric dials a , b , &c., substantially as and for the purpose set forth.

No. 46,497.—WASHBURN RACE, Lockport, N. Y.—*Skates*.—February 21, 1865.—This invention consists in the employment of an independent heel screw for skates, in connection with the standard of a skate runner and the wooden bed, so that the screw serves the double purpose of securing the parts together, and adjusting them higher or lower, to compensate for the enlargement of the hole in the boot in which it rests.

Claim.—The combination of the heel screw c , bearing a , and nut f , with the bed A and runner B , substantially as and for the purposes herein described.

No. 46,498.—ROBERT RAMSEY, New Wilmington, Penn.—*Bag-holder*.—February 21, 1865.—A standard is pierced with a vertical slot, through which passes a screw bolt, to which are attached arms, which are provided with a spring formed in one piece with them, by means of which, having been drawn together so as to be introduced within the mouth of a bag, they are expanded so as to hold it open. By means of the screw bolt in the vertical slot the arms may be adjusted at a height to suit the length of the bag.

Claim.—First, forming the expanding spring $A2$ in one piece of metal with the spreaders $A A'$, substantially as and for the purpose set forth.

Second, the screw bolt C and nut E , employed in combination with the spreaders $A A'$ and hooks $f f$, in the manner and for the object herein before stated.

No. 46,499.—THOMAS ROBERTS, Shelby, Ohio.—*Stove Drum*.—February 21, 1865.—This invention consists in constructing an annular chamber, with cone-shape ends, so arranged that the inner top casing can be extended or contracted by means of a lever passing through openings in opposite sides of the annular chamber, thus increasing or decreasing the radiating surface, and controlling the draught. The heat from the inner casing can be carried off to heat upper rooms.

Claim.—The cone end chambers or sections E and E' , annular chamber D , and the lever F , in combination with the tubes or pipes m and n , damper B' , and drum, when arranged and operating conjointly, substantially as and for the purposes set forth.

No. 46,500.—HERMAN RUGEE, Milwaukee, Wis.—*Heat Radiator*.—February 21, 1865.—In this invention segmental wings, forming an inverted cone, are arranged in a stove-pipe drum, and adjusted by links or rods connecting with a crank. When opened the products of combustion pass freely through the drum, and when closed they flow through a narrow opening between the base of the cone and the case of the drum.

Claim.—The adjustable segment wings forming an inverted cone, in combination with the crank, links, or rods for adjusting the wings, substantially as shown and described.

No. 46,501.—PETER SCHUTLER, Chicago, Ill.—*Machine for Holding Hubs while being Bored*.—February 21, 1865.—This invention consists of a machine composed of two cylinders, the one within the other, and to which the wheel is centrally clamped and firmly held, the boring being done by revolving the wheel instead of the cutter.

Claim.—The application of a screw ring D , which is provided with clamps $c c c$, to a holder C , which is applied to a rotating shaft B , substantially as described.

No. 46,502.—JACOB LEIBEL, Manlius, Ill.—*Harvester*.—February 21, 1865.—This invention has reference to the "thrust machine," and consists in arranging a trough at the back and midway the length of the cutters, on either side of which is an endless apron which receives the falling grain and discharges it into said receiver. An attendant occupies a stand back of the receiver and upon the main frame, and rakes the grain therefrom to one or the other of the two binders' stands, arranged on the main frame, on opposite sides of the raker's stand.

Claim.—First, the centrally arranged receiver o , constructed as described, in combination with the two endless aprons revolving towards the centre of the machine, and depositing the grain in said receiver, substantially as and for the purposes specified and shown.

Second, the platform Q, provided with the space I, when arranged in relation to the main frame and endless apron, substantially as and for the purposes specified.

Third, providing a harvesting machine, with the raker's stand P and the binders' stands R and S, when arranged on the main frame of the machine near the centre thereof, substantially as and for the purpose herein described.

No. 46,503.—CHARLES H. SHUTE, Edgartown, Mass.—*Rotary Photographic Plate-holder*.—February 21, 1865.—This invention consists in a mode of rotating the plate by a lever and ratchet, so as to bring a fresh part of the plate opposite the opening at each movement of the lever.

Claim.—The combination of the photographic dark slide A, having an orifice B and slide C, with the rotating box carrying the plate, and pierced in the face with a series of openings to correspond with the opening B as they are alternately exposed to it, the said box being rotated by a lever by means of a pin working into a ratchet on the back part of the lid G, the circuit of the ratchet wheel being divided to correspond with the orifices in the face of the rotating box.

No. 46,504.—JOHN W. SMITH, Boston, Mass.—*Rivets*.—February 21, 1865.—This invention consists in making a conical cavity or recess in the end of a rivet, to facilitate the process of spreading, by the blow of the hammer.

Claim.—A rivet constructed with a recess in its end, substantially as and for the purpose herein specified.

No. 46,505.—THOMAS SMITH and HENRY J. BROWN, Detroit, Mich.—*Tobacco Pipe-stem*.—February 21, 1865.—This invention consists in a chamber in the stem of a pipe for smoking; said chamber has in it two small tubes; over the lower one of these tubes a cap is fitted. This chamber is filled with water, which serves to cool the smoke, and also to extract from it the "nicotin." The cap serves to keep the water out of the tube, and also to impart a circuitous route to the smoke.

Claim.—The combination of the stem B B, chamber c c, and tubes D E, and the cap F, all constructed and operating substantially as and for the purpose set forth.

No. 46,506.—CHARLES W. STAFFORD, Saybrook, Conn.—*Construction of Ordnance*.—February 21, 1865.—In this invention two or more wrought bands, with tongues and grooves, are shrunk or secured on the breech. In front of these is another band, carrying the trunnions, having an inward projection at its rear, and abutting against a shoulder of the cannon in front. This projection and the bands supporting it behind take the recoil.

Claim.—First, in combination with the cast main body A of a piece of ordnance, two or more bands, (trunnion and re-enforce,) when secured and strengthened with longitudinally projecting tongue and corresponding grooves, in the manner as herein represented.

Second, the combination of the trunnion band U, adapted to slip on over the breech, the flange u, projecting inward from the said trunnion band, the shoulder a, preventing forward displacement of the trunnion band, and one or more re-enforce bands R, securing it against backward displacement, substantially as herein described.

No. 46,507.—WILLIAM B. S. TAYLOR, New York, N. Y.—*Flexible Tubing for Illuminating Gas*.—February 21, 1865.—This invention consists in lining flexible tubing with glue alone, or in combination with other substances, such as molasses, glycerine, &c.

Claim.—The use and application of glue or glue composition in the tubing, substantially as described, for the purpose of making the flexible tubing gas-tight, whether of cloth or rubber or other gum.

No. 46,508.—C. R. TOMPKINS, Rochester, N. Y.—*Machine for Cutting Barrel Heads*.—February 21, 1865.—This invention consists in providing a parallel lateral adjustment to the movable feed roller by hanging both ends in sliding boxes that are connected to an adjusting lever, and connecting the pinion that drives the feed roller to the shaft by a slot and feather, so as to keep it in gear with the feed roller pinion by means of an arm connected to the upper sliding box; also, in such a construction and arrangement of the connecting rod pawl and ratchet that the crank shall produce an intermittent feed, and during the instant the knife is at its upward stroke.

Claim.—First, the combination and relative arrangement of the rock shaft P and lever K with the upper and lower boxes f and f' of the adjustable feed roller d, substantially in the manner shown and for the purpose of producing a parallel adjustment of the said roller.

Second, in combination with the adjustable pawl arm y and ratchet a the crank J and slotted connecting rod R, substantially in the manner shown, and for the purpose of producing the intermittent feed, as set forth.

No. 46,509.—JOHN TRAGESER, New York, N. Y.—*Coils for Steam Heating Apparatus*.—February 21, 1865.—This invention consists in the arrangement of pipes connected with the supply and exit pipes, and by means of other pipes, the ends of which are formed with conical seats, ground to each other and held together by couplings, so as to be steam-tight but allow of a turning motion at said parts.

Claim.—First, the arrangement of the pipes *f i* and *k*, whereby the axial pipe *k* is allowed to expand or contract without injury to the joints, as set forth.

Second, the T pipes *d* and *l*, in combination with the coil *p* and couplings, whereby said coil can be twined up, as specified.

Third, the conical ground couplings applied, substantially as specified, to the coils of steam heating and boiling apparatus, so that said coils will be kept steam-tight at the joints and motion allowed for turning said coils up, as set forth.

No. 46,510.—JOHN VOAK, Penn Yan, N. Y.—*Curry Brush or Card.*—February 21, 1865.—In this invention there is a revolving brush and card, with receptacles for dust. The brush and card are revolved by wheels turned by a crank.

Claim.—The frame *A*, handle *a*, shoulder rest *a'*, and gearing *C B*, in combination with the brush *E* and receptacle *F*, the several parts being constructed, arranged, and operated as set forth.

No. 46,511.—WILLIAM WALES, Fort Lee, N. J.—*Microscope.*—February 21, 1865.—This invention consists in the application of two or more lenses or correctors, in combination with the same microscope object glass, in such a manner that the angle of aperture is left for natural reflected light, in contradistinction to the use of two or more front lenses which have to be changed and shifted to be adapted to central and oblique light.

Claim.—The application of two or more back lenses or correctors, in combination with the same microscope object glass, constructed and operated substantially as and for the purpose set forth.

No. 46,512.—JOHN H. WEEKS, Philadelphia, Penn.—*Retainer for Window Sash.*—February 21, 1865.—This invention consists mainly in the arrangement of the bolt, lever, and spring, by which the bolt is operated, and in their relation to each other for joint action.

Claim.—The combination of the lever *E*, its knob *G*, and arm or projection *e*, the spring *k*, bolt *D*, and its lip *c*, the whole being constructed, applied to a sash, and arranged for joint action, as and for the purpose herein set forth.

No. 46,513.—WILLIAM WEITLING, New York, N. Y.—*Device for Equalizing the Delivery of Thread from Shuttles and Spools of Seicing Machines.*—February 21, 1865.—The claim and drawings illustrate the nature of this invention.

Claim.—The application to the spool or bobbin in a shuttle, or other part of a sewing machine, of a thread leader, having a motion in the arc of a circle, and constructed and operated substantially in the manner and for the purpose described.

No. 46,514.—BENJAMIN WILDER, North Scituate, Mass.—*Apparatus for Softening the Gum of Adhesive Labels.*—February 21, 1865.—This invention consists of a vessel to contain water and a lamp, by means of which the water may be heated, the whole being placed within a suitable case or frame. Over the top of the vessel is stretched a piece of woollen cloth, or other similar material, upon which the labels are placed with the gummed side downward.

Claim.—The apparatus, substantially as and for the purpose described.

No. 46,515.—J. M. WILTSIE, Pittsford, N. Y.—*Apparatus for Distributing Fertilizers.*—February 21, 1865.—This invention consists in a handle provided with a catch or lock, so as to be made rigid or capable of being turned down to fill the vessel, and also in placing the register upon the inside of the vessel, and providing bars to keep the fertilizer from packing.

Claim.—First, the swinging self-locking ball or handle *B*, applied and operated in the manner and for the purpose specified.

Second, the application of the bars *C* in distributors for lime and other fine fertilizers, to be used by hand as shown, and for the purposes set forth.

Third, arranging the register plate *D* within the case as shown, and for the purposes described.

No. 46,516.—WILLIAM LOUIS WINANS, Baltimore, Md.—*Operating Ordnance on Gun-boats.*—February 21, 1865.—The gun-carriage is formed in two parts, the upper section swivelling upon the lower sections, and is supported on an adjustable chassis, the whole being raised and lowered by steam-power, and also supported on hydrostatic cylinders, which control the descent of the platform and its carriage. Sliding hatchways are opened and closed by the raising and lowering of the gun platform.

Claim.—Mounting the carriage of a gun on a platform which is connected with a plunger, to be elevated by the admission of steam to the cylinder, substantially as described, in combination with the connection of the said platform with other plungers fitted to cylinders to regulate the descent of the platform and gun by the flow of water or other fluid, substantially as described, and for the purpose specified.

Also, making the plungers, for regulating the descent of the platform and gun, with a cavity in the lower end thereof to retain air, substantially as described, to act as a spring cushion to receive sudden and violent concussions, as set forth.

Also, in combination with the mounting of a gun on a platform to be raised and depressed, the employment of a chassis connected with the platform and interposed between it and the carriage, and provided with wedges, or the equivalent thereof, to vary the inclination of the chassis, substantially as and for the purpose specified.

Also, connecting the upper part of the carriage, in which the gun is mounted, with the lower part thereof by means of a swivel, in combination with the chassis connected with the movable platform by which the gun is raised to be fired and let down to be reloaded, substantially as and for the purpose described, whereby the gun can be turned to take any range desired, notwithstanding the platform, by reason of its connections, cannot be turned.

Also, in combination with the platform for raising and letting down the gun, as described, the employment of sliding hatchways, so connected with the platform as to be operated by the motions of the platform, substantially as and for the purpose specified.

No. 46,517.—GEORGE L. WITSILL and EDWARD BURKE, Philadelphia, Penn.—*Well Borers*.—February 21, 1865.—The object of this invention is to combine with a central upward discharging rock drill a contrivance for elevating the fine debris to the top of the well, and thus keeping the drill clear during the operation of boring.

Claim.—First, the employment of two or more augers, in combination with a central upward discharging drill, substantially as described.

Second, connecting the augers A A' to the drill collar N in such manner that the augers can be rotated independently of the drill, or can be made to rotate the drill at pleasure, substantially as described.

Third, the centre drill point C, plunging cutters B B', collar N, and the right and left twisted elevators A A', combined and operated substantially as herein described.

Fourth, feeding the augers down to their work by means of right and left screws p p' p p, applied and operating substantially as described.

No. 46,518.—HENRY WURTZ, New York, N. Y.—*Preparing Barrels to Hold Oil, Petroleum, &c.*—February 21, 1865.—This invention consists in saturating the staves of barrels, tanks, &c., with a deliquescent salt, such as chloride of magnesium, and in afterwards applying a coating of hard soap solution, or a coating of starch or other paste.

Claim.—First, the introduction into the pores of wood and other porous materials, when used as materials for barrels or other vessels for holding oils, of aqueous solutions of deliquescent salts, as above set forth.

Second, the subsequent superficial application to such substances or agents which convert the deliquescent salts into insoluble compounds, as above set forth.

Third, the method of preparing barrels and other vessels composed of wooden staves, bound by hoops, for holding oils by filling them with deliquescent saline solutions and tightening the hoops as the wood shrinks by absorption of the liquid, as above set forth.

Fourth, the prevention of the corrosion of iron hoops, nails, and other iron fastenings of barrels and other vessels for holding oils, when impregnated with solutions of deliquescent salts, by adding to such solutions sucrate of lime, as above set forth.

Fifth, the application to the internal surface and between the joints of barrels and other vessels for holding oils, of a paste composed of deliquescent saline solution, combined with some substance of a gelatinous, glutinous, mucilaginous, farinaceous, gummy, or starchy nature, as above set forth.

No. 46,519.—VARNUM G. ARNOLD, Boston, Mass., assignor to himself and CHAS. G. BIRD; Roxbury, Mass.—*Ticket Holder*.—February 21, 1865.—The tickets are placed in a box on the roller, or are folded and the outward end passed over a bar and under an aperture, where they can be pushed forward for delivery by the thumb, successively, as wanted.

Claim.—A holder or case for passage tickets constructed with a delivery duct, in combination with an aperture A in the side of the same for the delivering the tickets one by one by the action of the thumb, substantially as herein described for the purpose specified.

No. 46,520.—HEZEKIAH BRADFORD, New York, N. Y., assignor to H. BOGART.—*Roasting and Desulphurizing Ore*.—February 21, 1865: antedated February 16, 1865.—Finely pulverized ore, while contained in a chamber, is subjected to numerous jets of superheated steam or heated atmospheric air, or both combined, which are forced through the charge so as to agitate it and act upon all the particles. That part of the charge which passes off with the jet of gas is saved by being directed into a reservoir of water.

Claim.—First, the process, substantially as herein described, of treating metallic ores in a finely divided or pulverized state in a chamber with jets of superheated steam or heated air, or both, jointly forced through the charge, substantially as and for the purposes specified.

Second, retaining the fine particles of ore that pass off from the ore chamber with the steam, air, or gases by passing the same into or through water, substantially as set forth.

Third, discharging the finely pulverized ore from the ore chamber through a pipe into a vessel or reservoir of water by the pressure of the air, gas, or steam, substantially as set forth.

No. 46,521.—JOSEPH R. BROWN, assignor to BROWN & SHARPE, Providence, R. I.—*Milling Machine*.—February 21, 1865.—A reference to the description and drawing will be necessary for a proper understanding of this invention.

Claim.—First, the combination of the elevating knee H, the sliding plate E, the swivel plate L, and sliding carriage G with the revolving cutter head, constructed and arranged to operate substantially as described.

Second, the arrangement of the centre spindle *b*, or its equivalent, with the devices which actuate and govern the movements of the same, in combination with the sliding carriage G and the devices by which it is operated, so that the two mechanisms may operate either separately or conjointly, substantially in the manner described.

Third, the arrangement within the centre head F of the swinging block R, or its equivalent, and the revolving spindle *b*, with the devices which operate the same, substantially as described for the purpose specified.

No. 46,522.—ELIZUR E. CLARKE, assignor to FRANKLIN N. CLARKE, New Haven, Conn.—*Machine for Cutting Pasteboard for Boxes*.—February 21, 1865.—This invention consists in a peculiar mode of holding the cutters, which slide in grooves and are adjusted by a scale which is conveniently located.

Claim.—The method of holding and adjusting the cutter, without the employment of the cutter stock, by combining with the cutter bar, having two side grooves and one tap groove, a cutter holder, slotted or grooved vertically for adjustment on a binding bolt, and horizontal sliding cross or T stud, together with the horizontally sliding form and collar screw for the vertical adjustment of the cutters, substantially as set forth.

Also, the attachment to the cutter bar of the parallel or horizontal beam or cap, set at a distance apart, to admit of the groove of the screw nut, in combination with grooves in both the said cutter bar and beam, to admit of the collar of the screw nut, the whole being arranged for operation substantially as set forth.

Also, the mode herein described of locating and holding a rule or scale in its proper relation with respect to the cutter by combining with the cutter bar and uprights, brackets or the equivalents thereof, in the manner substantially as hereinbefore shown and described.

No. 46,523.—J. W. H. DOUBLER, assignor to himself and JOHN E. WYNNE, Warren, Ill.—*Grain Drill*.—February 21, 1865; antedated February 6, 1865.—In this invention the drill is quite heavy and solid, with a front cutting edge to enable it to pass through sods or lumps of earth. The upper part of the drill is funnel-shaped, so that when moved forward or backward upon an adjustable beam the seed will always be properly conveyed. In the bottom of the seeder is a spiral distributor divided into as many distinct sections as there are drills, for the purpose of securing a perfectly uniform distribution of the seed.

Claim.—First, the hollow drills F G, constructed, arranged, and operating as and for the purposes herein specified and shown.

Second, the combination of the drills aforesaid with the adjustable bar H and lever *g*, arranged and operating substantially as and for the purposes shown and described.

Third, in combination with the above, the parallel bar L and the chains *p*, arranged and operating as and for the purposes set forth.

Fourth, the curved arms J, provided with the slot *j* and set screw *k*, arranged as and for the purposes specified.

Fifth, providing the spiral distribution D with the several bearings *ff'* so as to divide the same into separate compartments, substantially as and for the purposes herein delineated and set forth.

No. 46,524.—JOSEPH GOODMAN, Blackfriar's Road, England, assignor to CHARLES P. BUTTON, New York, N. Y.—*Carriage Wheels*.—February 21, 1865.—This invention consists in the employment of a disk with a conical central bore, in combination with a grooved plate and its central opening, and with the spokes and felly or tire of the wheel, in such a manner that by screwing the disk and plate together the spokes are forced out to a uniform distance from the centre and securely clamped, and the felly or tire is equally strained throughout the whole circumference and brought in the position of a true circle.

Claim.—The disk I, with the conical central bars J, in combination with the grooved disk L and its central openings *a*, and with spokes C and felly or tire D, constructed and operating substantially as herein described, so that by screwing the two plates together the spokes are forced out to a uniform distance from the centre and securely clamped.

No. 46,525.—THOMAS GEO. HAROLD, Brooklyn, N. Y.—*Mosaic Toy Blocks*.—This invention is sufficiently described by the claim.

Claim.—A series of square or cubical blocks whose surfaces are colored in triangular forms, as and for the purposes specified.

No. 46,526.—JOHN R. HARRINGTON, Brooklyn, N. Y., assignor to AGNES V. HARRINGTON, Brooklyn, N. Y.—*Tuyere*.—February 21, 1865.—In this device one side of a box is formed of a projecting funnel or cone, which, being exposed to the fire, heats the air which is made to impinge against it by being forced through a tube from the nozzle of the bellows. The

outlet is through another tube, which extends from the mouth of the funnel back into the box to within a short distance of the rear side

Claim.—In combination with the box A, provided with the projection *a* and tube *a*³, the back B, provided with the tube *b*³, when the same shall be combined and operated in the manner and for the purpose specified.

No. 46,527.—EDWIN A. LELAND, assignor to RADCLIFFE B. LOCKWOOD, New York, N. Y.—*Gas-heater or Blow-pipe for Heating Soldering Irons.*—February 21, 1865.—This invention consists in the construction of a sheet iron casing of a long funnel, horn-shaped, in which is enclosed a blow-pipe, or smaller horn, of nearly corresponding form, the large end being made of sheet metal, and the smaller end, for several inches in length, of wire gauze, terminating at the smaller end of the outside casing. This device is operated by placing the soldering iron in the small end surrounded by the wire gauze, the handle being supported in place and having a suitable bracket attached to the casing. A gas pipe is opened in the larger end between the inner and outer funnel, where it receives a large admixture of air, and in passing up is ignited, where it escapes through the wire gauze, the intensity of the flame being promoted by a blast through the inner horns.

Claim.—The new article of manufacture, consisting of a gas furnace or blow-pipe, constructed substantially in the manner described, for the purpose of heating soldering tools, and for other similar purposes.

No. 46,528.—SAMUEL MACFERRAN and STEPHEN USTICK, assignors to SAMUEL MACFERRAN, Philadelphia, Penn.—*Coat and Hat Rack.*—February 21, 1865.—This invention consists in the combination of a bar with sliding hooks, and brackets with hooks.

Claim.—The combination of the segmental or elliptical bar A, the hook B, the bracket C, and hook B', substantially in the manner described and for the purpose above set forth.

No. 46,529.—HENRY F. METZLER, assignor to himself and THOS. G. COWPERTHWAIT, New York, N. Y.—*Spring Horse.*—February 21, 1865.—In this device two parallel bars are connected with the under part of the hobby-horse at their upper ends, while the lower ends are fastened to the axes of the pulleys, having spring bands. The horse when moved forward or backward has a motion which resembles the jumping motion of a living animal.

Claim.—The manner in which the standards are arranged, combined, operated, and adjusted relatively to their several parts and to the horse baby-tender or chair, whereby the several motions, as described, are obtained.

No. 46,530.—THOMAS MAYOR, Pawtucket, R. I., assignor to GEORGE CHATTERTON, Providence, R. I.—*Roving Frame.*—February 21, 1865.—This invention consists in giving a firm support and bearing to the top of the spindle, and also to admit of its running with uniform steadiness at the highest rate of speed. The bolster or upper bearing is so constructed and connected to the traverse rail as to extend this bearing near to the top of the spindle, and to reciprocate the said bearing between the top of the spindle and the delivering point of the flyer. The foot piece of the bolster is secured to the side of the rail instead of upon its top.

Claim.—The construction and mode of arranging the bolster with the spindle and the transverse rail, or its equivalent, substantially as described for the purpose specified.

No. 46,531.—LYMAN F. MUNGER, Rochester, N. Y., assignor to himself and WALTER K. MARVIN, New York, N. Y.—*Lock.*—February 21, 1865.—The nature of this invention will be understood from the claim.

Claim.—First, the combination in a lock case of frictional key tumblers, bolt and fence tumbler, together with the follower or lever to actuate the same under the arrangement herein described, so that both the said key tumblers and bolts when actuated shall move in planes parallel to each other, substantially as set forth.

Second, in combination with horizontally sliding key tumblers and double-gated bolt, the double-acting fence tumbler, operating as described, so as to lock the bolt whether shot out or withdrawn, substantially as set forth.

Third, the method herein described of operating the key tumblers by forming a cam groove in the fence tumbler, in combination with a pin passing through and projecting from the said key tumblers, the whole being arranged for operation substantially as set forth.

No. 46,532.—JOSEPH RIDER, Newark, Ohio, assignor to himself and E. REMINGTON & SONS, Ilion, N. Y.—*Breech-loading Fire-arms.*—February 21, 1865.—In this invention the hammer is hung to the side of the arm, which is hinged to a slotted tug extending laterally. It has a nose or extension on its under side, which enters a slot made through the top and bottom of the barrel when in place, closing the breech and forming the recoil piece. On the front side of this tug is inserted a spring hinged-lever, having a projection at each end: as the hammer flies home into its seat this spring lever explodes the cartridge, its lower end being forced back and its top forward.

Claim.—First, combining with a hammer that is hung upon the side of the arm, and moves at right angles to the bore of the gun, a nose or projection, which, shooting into a mortise through the barrel, forms a breech-piece, substantially as and for the purpose described.

Second, combining with such a hammer, or the projection thereon, a pivoted trigger of lever, for striking or impinging upon the cartridge, and thus exploding it simultaneously with the closing of the arm, substantially as herein described.

No. 46,533.—E. B. SINTZENICH, assignor to himself and JOSEPH HALL, Rochester, N. Y.—*Steam Boiler*.—February 21, 1865.—This invention consists in the arrangement of water flues or tubes within the horizontal fire flues of steam boilers, and in the combination and arrangement of the manhole with the flues in such a manner as to afford facilities for repairing and cleaning the same. A combustion chamber is placed in the water space above the fire box to which fire flues are attached, and which extend back to near the rear end of the boiler, where they connect with another combustion chamber. Through these flues tubes filled with water pass, the front ends of which are turned at right angles, and pass down and are attached to the lower sheet of the front combustion chamber, through which they communicate with the water space of the boiler, their rear ends communicating with the rear ends at the rear. The manhole opens into the front combustion chamber, and affords a means of access thereto and to the tubes and flues.

Claim.—First, the arrangement of the water flues centrally within the horizontal fire or combustion flues of marine boilers, as shown, and for the purposes set forth.

Second, the combination and relative arrangement of the manhole D with the horizontal return fire or combustion flues and their water flues, the latter having their front ends connected with the water space surrounding the combustion chamber I, substantially as shown and described and for the purpose herein set forth.

No. 46,534.—CORNELIUS ST. JOHN, assignor to ROSCOE G. TURNER, assignor to CHARLES C. BEERS, Boston, Mass.—*Shade-holder for Lamps*.—February 21, 1865.—This invention consists in a socket and spring support, by means of which the lamp shade is supported, not on the chimney, but on the lower part of the burner, so that the shade may not become heated and charred.

Claim.—The spring support C, in combination with a socket D, operating substantially in the manner and for the purpose set forth.

No. 46,535.—JOHN CHAPMAN, M. D., Somerset street, Putnam square, London, England.—*Means for Applying Heat and Cold in Treatment of Diseases*.—February 21, 1865.—This invention consists of an apparatus composed of India-rubber bags divided into cells, which, when filled with hot or cold water, are applied to different portions of the spinal column.

Claim.—The manner of applying heat and cold, solids or fluids, by means of "spine bags," composed of India-rubber or other water-proof flexible material, when said bags are divided into two or more cells or compartments, whether such cells or compartments are formed by the pressure of clamps upon the exterior or by the use of one or more interior partitions.

Also, spine bags for making hot applications, when such bags are composed of two or more tubular compartments.

No. 46,536.—CARL SCHINZ, Offenburg, Grand Duchy of Baden.—*Furnace for Burning Gas*.—February 21, 1865.—This invention consists of a furnace enclosed in thick brick walls, in combination with a generator, which is provided with a fire grate, the fuel being introduced through a charger. The combustible gases rise through the channel, which is provided with a gas splitter, consisting of a series of small channels. The air is introduced through the channels, which are closed and opened by a slide, and a window, which allows the process to be observed. The mixed air or gases are burned in the channels or flues, and the products of combustion pass into the space under the boilers, where they give up their heat, and they are finally carried off by a chimney.

Claim.—First, the employment or use of the gas splitter G, with two or more tuyeres *k*, in combination with the generator C, air inlet *i*, and combustion flue *o*, or its equivalent, constructed and operating in the manner and for the purpose substantially as herein specified.

Second, the employment or use of two or more air tuyeres *i*, in combination with the channel F rising from the generator C, and with the combustion flue *o*, or its equivalent, constructed and operating substantially as and for the purpose set forth.

Third, the employment or use of two or more combustion flues *o*, proportioned according to the rules above specified, and arranged in combination with the gas channel F and air channel or channels *i*, substantially in the manner and for the purpose set forth.

Fourth, the application of a window J in front, and one or more loopholes *q* in the rear, of the combustion flues *o*, substantially as and for the purpose specified.

No. 46,537.—WM. BANKSON, Mt. Pleasant, Iowa.—*Cultivator*.—February 23, 1865.—This invention consists in attaching four shovels or ploughs to the frame, which is made in width to suit the corn planter, of any desired gauge. This frame is hung on the outer frame by a rod, and raised up or let down at will by a lever on the centre of the machine: the forward end of the lever is attached to the front bar of the frame by a chain, and the position of the lever when raised is held by a hook or catch on a bar at the end of the machine. The front shovels are moved from right to left, being suspended on a rod or bar at

the front of the frame by a lever loosely bolted on its centre, and moving on its own fulcrum through a cross-bar in the centre of the frame, and passing under another rod or bar at the rear end of the machine, so that the front shovels may be controlled by the driver from his seat by ropes attached to the lever and brought over pulleys in the corner of the frame and from thence to the right and left side of the driver's seat.

Claim.—The frame F F, the lever L, the suspension of the ploughs 3 and 4 on bar X and the moving of them with the lever N, when constructed substantially as described and for the purpose set forth.

No. 46,538.—W. W. BATCHELDER, New York, N. Y.—*Lamp.*—February 28, 1865.—The nature of this invention consists in the combination of certain safety valves with lamps, wherein the pressure of the gas inside the reservoir aids in feeding the flame, to secure the reservoir from possible explosion.

Claim.—The combination of the safety or controlling devices herein described with a lamp, constructed and operating as herein described.

Also, the combination of the controlling conical screw E g with the cap B, tube C i, and lamp reservoir A, all constructed and operating in the manner and for the purpose substantially as described.

No. 46,539.—WILSON BOHANNAN, New York, N. Y.—*Padlock.*—February 28, 1865.—This invention consists mainly in the combination and arrangement of a vibrating spring pawl, with a spur projecting downwards from the hinged end of the shackle, and also of the pawl, with the tail of the dog, which locks the free end of the shackle; the arrangement being such that so soon as the dog releases its hold the shackle will be thrown back and held so by the pressure of the pawl upon the spur, while at the same time a tooth projecting from the edge of the pawl will catch under the tail of the dog and thus hold the tooth of the dog back and out of the line of travel of the shackle until the action of the key upon the dog forces it from its connection with the pawl.

Claim.—First, so constructing a padlock that in the act of closing the shackle B this latter will release the hooked plate d' from a toothed pawl b previously to locking, and still act upon the said plates, substantially as described.

Second, receiving the hook d on the catch plate d', in the act of closing the shackle B upon the nose of this shackle, after said plate is released from the tooth j of pawl b, substantially as described.

Third, so constructing the teeth i j on the pivoted plates d' and b that, in the act of closing the shackle, the latter will force the hook d backward to receive the nose c, substantially as described.

Fourth, the combination of the shackle B, with its slotted nose and lever-tooth spring pawl b, with its tooth j, catch plate d', with its hook d, and tooth i, and the slotted tumbler or tumblers g g', all arranged and operating substantially as described.

No. 46,540.—JACOB BRINKERHOFF, Auburn, N. Y.—*Corn Sheller.*—February 28, 1865.—In this machine the ears of corn, while being shelled, are caused to rest upon a bed-piece of peculiar shape, which admits of the free passage of the shelled corn, which falls from thence upon a screen.

Claim.—The bed-piece M, constructed as and for the purpose herein set forth.

No. 46,541.—MARCUS BROWN, Fond du Lac, Wis., and OSCAR J. SHANNON, Fairwater, Wis.—*Fence.*—February 28, 1865.—In this fence the posts are bevelled at the ends diagonally from each other. The lower end is inserted into a link or band, which is smaller than both posts, with the bevel towards the standing post, and by bringing it up to a vertical position the link is embedded in the wood and holds it firmly. The upper end is held by placing another link around the top of both; the bevel being outward allows the link to pass over the ends of both.

Claim.—First, constructing a fence with posts having bevels d d, substantially as and for the purpose set forth.

Second, the bands e, or their equivalent, in combination with bevelled posts a a', substantially as and for the purpose set forth.

No. 46,542.—CHARLES E. CARPENTER, Providence, R. I.—*Electro-magnetic Signal-boxes.*—February 28, 1865.—The nature of this invention is evident from the claim.
